In addition to the cargo cranes on the wharves, there are two electrically-operated heavy lifting cranes. The first of these is a 50-ton crane of the ordinary jib type situated at No. 6 Dock. This crane, which was the first electric crane to be installed, being erected in 1904, has a radius of 87 ft. A recent addition to the plant is a 150-ton floating crane (fig. 4), built last year by Messrs. Cowans, Sheldon & Co., Ltd., of Carlisle. This crane is entirely self-contained and can either be operated by an independent generating set contained in the pontoon or by supply from the shore. It is of the luffing type and has three separate hoisting gears. The main hoist has a maximum radius of 106 ft. In this crane there are three motors of 80 b.h.p., one of 160 b.h.p., one of 60 b.h.p., and two of 30 b.h.p. The whole of the electrical control, which is mainly effected by contactors and master controllers, was supplied by the Igranic Electric Co., Ltd. The warping of the pontoon is carried out by means of four electrically-operated capstans on the deck and an electric winch is used to manipulate the anchor.

A number of warehouses situated around the Inner Dock are equipped with belt conveyors for handling grain, the grain in the first place, being raised from the ship's hold by means of a bucket type elevator of 100 tons per hour capacity. All this machinery is electrically driven but there are no features in connection with it which can claim special interest.

After tests of many types of electric battery trucks it was decided to employ the electric elevating platform truck manufactured by the Elwell Parker Electrical Co., Ltd. This truck, which is of a particularly robust construction, has a capacity of two tons. There are already 28 of these in operation. They are propelled by Edison nickel-iron accumulators, each capable of working on one charge for an eight-hour day; the working time can be further lengthened if required by a mid-day boost at a heavy charging rate. The charging of the batteries is carried out by means of a five-wire balancer supplied from the

Fig. 4.—A 130-ton Floating Crane (Messrs. Cowans, Sheldon & Co., Ltd.

480-V mains. For moving odd wagons, ships' booms and gangways, and other heavy transportable articles for which horses were previously employed, two battery-operated tractors, also supplied by the Elwell Parker Electrical Co., Ltd., are in use. The longer distance conveyance of light cargo and the collection and disposal of refuse, is carried out by battery-driven lorries of 2½-tons capacity, two of which are of the tipping type. These lorries were manufactured by Messrs. Garrett and Sons, Ltd., and are also equipped with Edison batteries. These battery vehicles have amply justified the somewhat heavy first cost involved.

The various ship repairing workshops in the docks are all supplied with electricity from the dock mains, and power is also available for other occasional work.

Discussion.

The above paper and that on the Southampton electricity undertaking by Mr. W. G. Turner, which was abstracted in our issue of September 4th (p. 391), were discussed together.

Mr. Aldridge, who was the engineer of the company which commenced the electricity supply in Southampton, spoke of the difficulties which the company encountered. Referring to Mr. Wauchope's paper he stated that he was the inventor of the first free-barrel crane

Mr. F. H. Nalder drew attention to the advantages of the efficiency meter which Mr. Turner had devised. He considered that its use would develop rapidly.

Prof. F. C. Lea asked Mr. Turner if the fuel-saving effected in the Southampton electricity works justified the heavy capital expenditure involved, and if the use of pulverised fuel had been considered. Many American power stations claimed great economies from the use of coal in this form. He asked Mr. Wauchope to say how electric cranes compared, as regarded running cost and reliability, with hydraulic cranes.

Mr. Turner, in replying, said that the Southampton undertaking had the unenviable distinction of possessing five different systems of supply; a change-over to 3-phase a.c. was being made as rapidly as possible. He pointed out that a great deal of the capital expenditure was due to converting plant. Pulverised fuel had been considered unsuitable; the theoretical saving was not sufficient to justify the capital expenditure involved, although no doubt it would be excellent for a new plant.

Mr. Wauchope, replying to Prof. Lea's question as to how electric cranes compared with the hydraulic type, said that the consumption of pressure units by hydraulic cranes was out of all proportion to the work that they did; as the compressors had to be kept running whether the cranes were working or not. The cranes could not be compared with electric cranes. The latter were certainly more reliable, especially in winter, and stoppages for repairs were very infrequent. The chief trouble was the plug boxes on the quays, which, at times, were liable to be flooded.

The President (Sir Archibald Denny) said that his experience had proved that electric cranes were far ahead of hydraulic cranes. Except for very short lifts his firm had entirely replaced the hydraulic by electric cranes.

Standardisation in Industry.

By C. le Maistre, C.B.E.

(Abstract of Paper read before Section G.—Engineering.)

This paper dealt with the present position of standardisation generally. After referring to the need for greater economy in industry by the elimination of waste and excessive diversity of parts through the medium of standardisation the author said that during the past 25 years the B.E.S.A. had carried out a great deal of most useful work in industrial standardisation. The simplification and standardisation of steel sections had resulted in a saving of 5s. per ton to the steel industry, whilst recently a single electrical specification resulted in a saving of £10,000 in the stock which one company alone had to carry, and a continuous saving of £500 per annum. Since the war many other countries had instituted national organisations and in practically all cases they had drawn on the experience of the B.S.A. In the United States, in addition to a standardisation organisation, there had been instituted by the Government a Division of Simplified Practice, which carried on a campaign for the elimination of national waste, under the Department of Commerce. The procedure of that Department was based almost entirely on that of the B.E.S.A. with the exception that it was financed entirely by the Government, and the term "simplification" had been adopted as being more significant commercially than our term "standardisation."

Among the results of these efforts, which began in 1921 in the U.S.A., were the following:—The American miller cutter industry, after months of study and survey, had made a reduction of 35 per cent. in prices. A reduction of 50 per cent. had been made in the sheet metal industry in the varieties which had to be stocked by the ironmongers in the States. Even in the china trade, the paper-bag industry, the lumber industry, and many others were to be found examples of reductions in varieties and consequently in prices through the application of the principles of simplified practice, upon which the U.S.A. Government was now spending £20,000 per annum. After pointing the directions in which similar results could be achieved in this country through the medium of the B.E.S.A., the author pleaded for a greater measure of financial support for the work in hand and in prospect. At present the general funds were provided largely by industry and, to a very small extent, by the Government. The Association was not a profit-making concern, and all the expenses were concerned with office accommodation, staff salaries, and so on, amounting to £1,000 per annum. Manufacturers also helped in many ways other than in providing finance, and it was computed that the total value of the support given by industry was about £4,000 per annum. Support was also given by the Governments of the Oversea Dominions, including the Government of India and the Crown Agents for the Colonies. Considering, however, the large sums of money being devoted to similar work in the United States and other countries, the hope was expressed that the British Government would recognise the appropriateness of increasing its support of that much-needed national work so that it might no longer be as hampered as it was at present in its activities for the benefit of industry. Many thousands of copies of British Standard Specifications had been translated into foreign languages in an endeavour to assist British trade abroad, but this work had had to cease on account of lack of funds. In order to widen the scope of the membership, the Main Committee was, in October, putting into operation a scheme for the reorganisation of the membership. The members of technical committees of the Association were to be known as honorary members and a new class of membership was being formed to include professional engineers, individual firms, and business men connected with the great industries of the country, who were to be invited to become members at a minimum annual subscription of two guineas. The income from this new source would be used more particularly towards making the home work effective throughout the world. Some of the representatives of the trade organisations who had taken part in drawing up the scheme had already intimated their willingness to continue their present very considerable contributions and, at the same time, to recommend to their constituent members the great desirability of applying for membership of the B.E.S.A., thus enhancing the value of the trade contributions and assisting the Association to widen its scope.

Recent Progress in the Peat Problem.

By Dr. R. Mollwo Perkin, C.B.E.

(Abstract of Paper read before Section B.—Chemistry.)

This paper described a new process for treating peat which, the author claimed, enabled it to be marketed in a form which contained only 20 per cent. of moisture, if necessary. But peat produced by this process, in which 40 per cent. of the original moisture remained, was said to be specially suitable as a fuel for electrical generation purposes, and figures were given showing that the calorific value of such a fuel compared exceedingly favourably with coal. Although figures of working costs were not given it was stated that the cost of peat treated by the process in question compared well with that of coal. The process described was admittedly based on the failures of the past. The great problem in treating peat was to remove the large amount of water in it and many methods had been suggested for doing this which were classified as follows:—(1) Maceration; (2) Heating and compression; (3) Electrical; (4) Chemical; and (5) Macerating, heating under pressure, and briquetting. Although full details of the plant used in the process described were not disclosed, the author said that it consisted of a combination of maceration, under suitable conditions, extracting as much water as possible, and then passing the peat into an autoclave and heating it under regulated pressure. This caused a certain rise in temperature, and then the peat was suddenly discharged by means of a sluice valve, the necessary water afterwards being filtered or pressed off and finally passed into a press. In this way briquettes containing from 18 to 20 per cent. of water only had been made. The speed of this plant was such that the briquettes were made within eight hours and were immediately ready for transport, being very hard and not liable to disintegration. It was said that the process was extremely simple to work and did not require much labour.

The author said that British peat was much superior in many respects to foreign peat and that in the United Kingdom and Ireland there was some 8,000,000 acres of an average depth of 12 to 14 feet. Dr. Perkin made a strong plea for the immediate development of this new industry, now that it had been shown that there was an economic and commercial process available. The fuel, he claimed, would not compete with coal in the ordinary way. On the other hand, from it smokeless briquettes were obtained, as well as a very valuable charcoal for metallurgical purposes—to replace the Swedish wood charcoal now imported—a high yield of oils, and a material valuable as a decolorising agent. The specific gravity of the peat so treated was about that of coal, so that the freightage would not be higher.

Among the processes mentioned which had been tried for the treatment of peat in order to make a commercial article, was the Buckle process. In this, the peat, after being macerated was mixed with a little water, in order to make it less pasty, and was forced under a pressure of about ten atmospheres through a tube system which was heated to a temperature of about 100 deg. C. A current of electricity at 200 V was passed through the tube system, it being claimed that electrical osmosis caused the decomposition of the hydro-cellulose. The inventors of this system stated that if the passage of the peat pulp between the electrodes was arrested, the electric current automatically ceased to flow because the peat ceased to conduct electricity as soon as the hydro-cellulose in it was decomposed. It was found advantageous to change the polarity of the electrodes from time to time in order to prevent accumulation of peat material on the positive electrode. Either alternating or direct current might be used but a direct current appeared to give the better results. The main object in heating the peat was to cause it to conduct electricity; it had been found that below 80 deg. C., peat was such a bad conductor that practically no electro-osmosis took place. A unit working scale plant was erected in Norfolk which was capable of dealing with 250 lb. of peat pulp per hour, and Dr. Perkin stated that this small plant worked very satisfactorily. It had not, however, been developed on a commercial scale. In the process described by Dr. Perkin, and for which he claimed many advantages, electricity did not play a part, so far as the actual process was concerned. The electrical interest in it was the claim that peat with from 30 to 40 per cent. of moisture made an ideal fuel for the production of electricity.

Egyptian Trade and Finance.

A Record of Prosperity.

A report upon the economic and financial situation of Egypt has been forwarded to the Department of Overseas Trade by Mr. E. Homan Mulock, Commercial Secretary at Cairo.*

It is stated at the outset that Egypt is in a very prosperous condition, owing mainly to the enhanced value of cotton exports during 1924. The general trade figures show that exports from Egypt during 1924 exceeded imports by £E16,467,000. There was a substantial addition to the financial resources of Egypt during that period, this being represented by an increase in the country's foreign investments. To these important factors in the prosperous economic situation of Egypt is added the highly-satisfactory condition of Government finance, indicated by an estimated surplus of nearly £E6,000,000 on March 31st, 1925, and a corresponding increase in the Reserve Fund which on that date was approximately £E24,000,000. In addition to this, two special reserves have been created, one of which relates to the Ottoman Debt, while the other (£E1,537,000) is a reserve relating to the capital account of the State railways, telegraphs and telephones.

Telephone Development.

The 1925-26 Budget embodies a total credit of £E182,300 for telephones. This includes £E38,500 for automatic exchange equipment, £E32,500 for new telephone instruments, and £E21,000 each for telephone trunks and additional manual exchange equipment. On the revenue side, the telephones are expected to bring in £E105,000, this substantial increase over the 1924-25 figure being an anticipation of increased business upon the opening of the first automatic exchange (2,000 lines) and an additional manual exchange (6,000 lines). The automatic exchange was ordered from a British firm by the Ministry of Communications, but for a number of reasons the precedent was not followed up, the latest addition being the 6,000-line manual exchange. It is satisfactory to note that out of a total value of £E48,681, representing telegraph and telephone material imported during 1924 (as against £E33,336 in 1923), Great Britain supplied goods to the value of £E36,038, the next highest being Sweden (£E7,754). The figure represented a rise of almost 50 per cent. above the 1923 total.

Electrical Trade.

The report states that last year marked a general advance in municipal electrical undertakings in the provinces; seven contracts, totalling approximately £E180,000, for the supply and erection of equipment for generating stations have been placed. Mr. Mulock says that it is to be regretted that, with one exception only, United Kingdom manufacturers do not appear to have submitted tenders for provincial electricity undertakings. All the generating plant and most of the material for the distributing systems is being supplied by German manufacturers. One local agent, however, who represents various French suppliers having a large capital in depreciated French francs, was able to secure a contract at a very low price for an electrical distribution system, valued at about £E20,000, in the provinces. The Diesel engines for these installations are, with the exception of two small orders placed in Germany, being supplied by a well-known Swiss firm. An order for water turbines for one installation was also secured by a Swiss firm, the main contractors, however, being the local representatives of the Siemens-Schuckertwerke. A comparison of the tenders submitted shows that, whereas there was little appreciable difference between the Swiss and German prices for engines for electrical generating plant, French and British quotations were about 20 and 50 per cent. respectively above those of German firms. The only important order placed by the Ministry of Public Works during 1924 was one valued at £E12,000 for extensions to power plant, four 50-h.p. motor-pumping sets, and 4 km. of underground armoured cable for Montazah Palace. The order for Diesel engines went to Italy, that for generators to Germany, that for pumps to Switzerland, and the motor and control gear and cable was ordered from a Belgian firm. There has been little activity in the local business world, owing to the fact that the more important public utility companies purchase, as a rule, through their head offices in Brussels and Paris. An appendix to the report shows that Great Britain's share of the machinery trade has not been so meagre as the foregoing notes might suggest. Stationary i.c. engines to the value of £E399,718 were imported during 1924, and Great Britain's share of this amounted to £E216,639, as against £E147,399 in 1923. Again, out of the total imports of power pumps valued at £E59,495, the United Kingdom provided £E25,936, as against £E14,908.

In the small supply business, in spite of the fact that the market is inundated with lighting fittings and various appliances of German manufacture, there is a good demand for American goods in these lines. Small generators and motors supplied locally are mostly of French or Italian manufacture, but here, again, there is a steady demand for the superior American-made motors. Mr. Mulock considers that it is not too much to expect of British manufacturers that they should make greater efforts to capture a proportion of this trade. It is also of interest to note that local German dealers are p chasing American lighting switches in considerable quantiti

Compared with the year 1923, the volume of electri business, apart from Government contracts, has risen steadi and an increasing demand by local industrial concerns electric motors has been remarked. Outside the cities Cairo and Alexandria there has been little demand for electri goods, but the extensive construction of new buildings in th towns has involved a large increase in installation wo which is often carried out by some obscure dealer posses of little or no knowledge of the work.

Electrical Import Statistics.

The imports of electrical machinery during 1924 reached value of £E146,564, as compared with £E144,361 in 19 The shares of the principal importing countries were as f lows:—France, £E45,605; United Kingdom, £E28,7 Switzerland, £E18,418; Germany, £E16,926; United Stat £E13,502; and Italy, £E13,326. The United Kingdom, G many, and Switzerland increased the value of their suppli but those of most of the other supplying countries dropp very considerably. The total trade in "certain appliance and batteries amounted to £E50,218, of which the Germ share was £E15,334, the British share £E13,569, and that Italy £E10,493.

The electric lamp market shows little change, one Dut firm supplying about 50 per cent. of the total consumptio but German penetration has become more marked of la In respect of this market, a recent price agreement arriv at by most of the leading lamp manufacturers should te to distribute this business among the various local deale but as the latter are not in every case adhering to this agr ment, British lamp manufacturers represented locally are a worse position than before. It is expected that furth developments will arise in the future. The total import lamps amounted to 1,363,103, valued at £E39,352; the Unit Kingdom's share amounted to only 13,416, valued at £E6

Many proposals, such as traffic control by electricity Cairo and Alexandria, electric transport trucks and overhe travellers for use at the main railway stations and warehous and improved electric lighting schemes, have been submitt by at least one British firm, but the Egyptian Governme appears to maintain a somewhat lethargic attitude with rega to such proposals.

Advice to British Traders.

Mr. Mulock says that in spite of German competition in t small electrical supply business, it is quite reasonable to assu that if British manufacturers had extended their advertisi and trade propaganda in general they would have obtain quite an important share of the trade. Under present con tions, however, their local representatives find themselv almost unable to obtain a market for their principal goo whereas foreign competitors have every facility possible securing distributors, &c. Foreign private enterprise, duri the year under review, was handicapped by reason of t unsatisfactory political situation, but it is hoped that the adverse conditions, so prejudicial to the economic welfare the country will, under the present Government, tend disappear.

The lift business is at present mostly in the hands of Milan company; the low rate of exchange in its favour a its working arrangements with local building contractors lea little chance for competitors to seriously disturb its positio However, as a well-known Swiss firm of lift manufacture has cut prices with a view to challenging the Italian firm supremacy, it is to be hoped that United Kingdom firms w also study this very difficult market.

Suggested Development in Persia.—In the course of report to the Department of Overseas Trade, Mr. R. H. Hadow M.C., Secretary in Charge of Commercial Affairs at the Briti Legation, Tehran, says that there can be little doubt that a opportunity presents itself to any firm which can make a sati factory agreement with the Persian Government for the util sation for electrical purposes of the energy existing with measurable distance of the capital in the form of two co siderable rivers, each of which could be dammed with no a parent difficulty. Provision in this manner of cheap power f lighting, traction and heating would make no small differen to the life of the capital, and would doubtless lead to simil development in other districts of Persia, such as Tabriz, Isp han, and Shiraz. An accurate survey of the rivers would b necessary. The report also says that a concession for the d velopment of telephonic communication in Persia has been f some years in the hands of the Persian Telephone Co., whic has recently commenced work in Tehran in conjunction wit the German firm of Siemens and Halske. At the present tim telephone systems exist in the principal cities of Persia, bu the companies are small and the service is variable.

* Stationery Office, 2s. net.

Underground Cables in the United States.

SOME particulars of interest concerning cables installed in the United States are given by the *Electrical World* in a review of the work of the Underground System Committee of the N.E.L.A. during the past year.

During 1923 and 1924 the Electrical Testing Laboratories of New York tested 3,725,999 ft. and 4,269,139 ft. of cable respectively. Of the latter 87.45 per cent. was passed, 8.45 per cent. held over as deficient in minor respects, 3.84 per cent. rejected and 0.26 per cent. withdrawn by the manufacturers. The outstanding points of interest considered were the high-pressure joints made on cables installed in America. These joints were of the design of three European companies and were installed on cables made by these firms under the supervision of their engineers The designs of these joints, as regarded the amount of applied insulation, dimensions, filling temperatures and pressures, methods of connecting the conductors, &c., were very different from each other and from American practice.

Eight months' service of the two 66-kV lines in Cleveland has resulted in no joint failures in service, and three failures in tests. The test failures were ascribed to the migration of a large amount of the filling compound, which is "thin," into the cable itself.

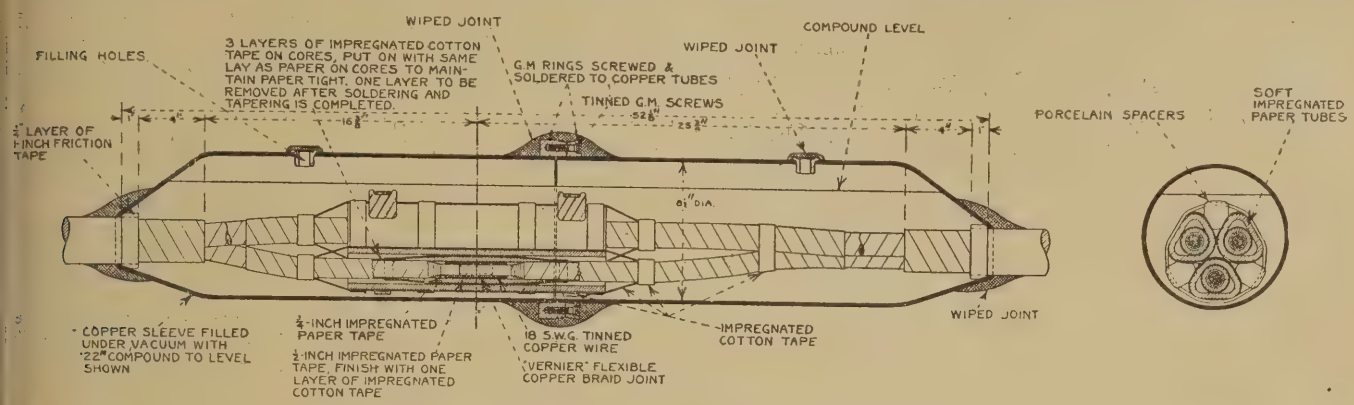

Fig. 1.—Section of 35-kV Cable Joint (B. I. & H. Cables).

The design of potheads which have been used for pressures below 15,000 V has been standardised in some cases for several years and very little trouble is experienced with them. Recent cable installations at pressures as high as 35 kV for 3-core cables and 66 kV, 3-phase, for single-core cables, have produced the necessity for potheads for these installations, and the requirements have been met successfully. At the present time there are manufacturers who claim that they can make potheads which will be satisfactory for single- conductor cables

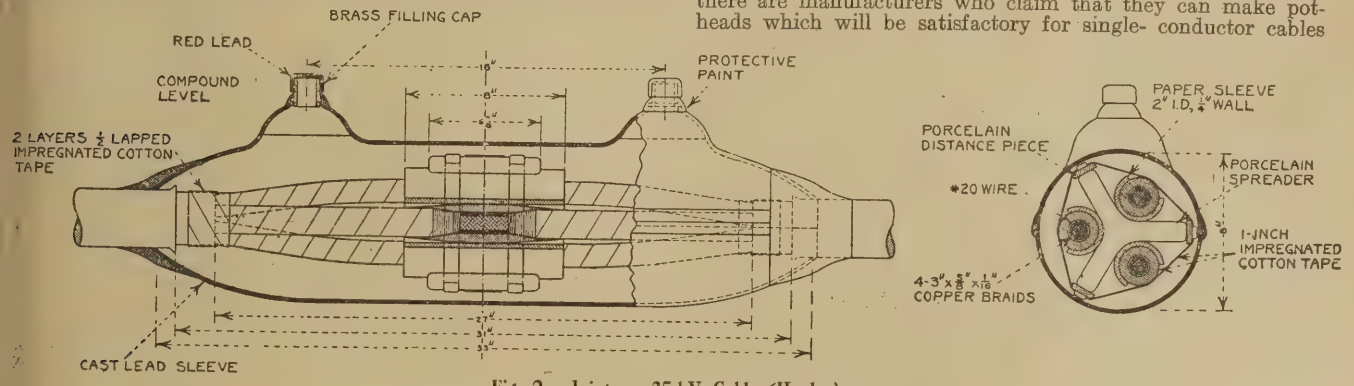

Fig. 2.—Joint on 35-kV Cable (Henley).

on 100- to 132-kV three-phase circuits. Thirty-one companies have contributed information on high-pressure cable performance for the year 1924. While this is twice the number of companies that reported during the previous year, the total mileage of cable of the additional companies is only about 8.4 per cent. of the total. The total amount of high-pressure cable in operation by all the companies which reported for 1924, including all pressures of 6,600 V and over, is 7,321 miles. Of this 85 per cent. is operating at pressures below 16,500 V. The total mileage of h.p. cables in operation during 1924 represents an increase of about 36 per cent. over that for 1923.

The combined cable and joint failures for 1924 was 13.3 per

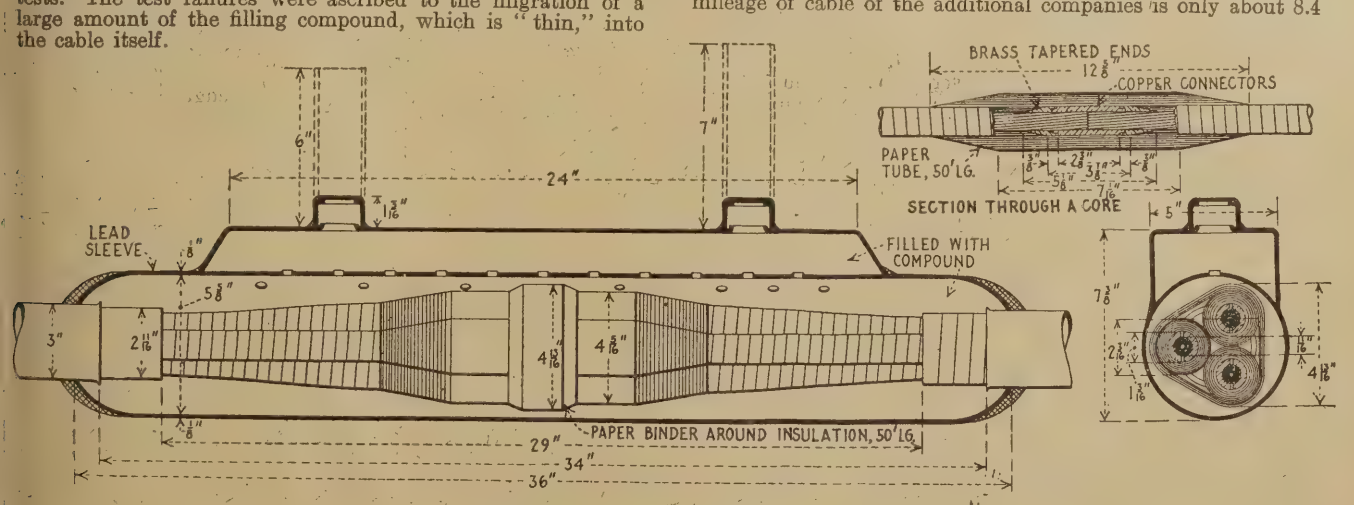

Fig. 3.—A 36-kV Cable Joint (Pirelli).

A joint for a 350,000-circ. mil, 3-core, 35-kV cable, installed by British Insulated & Helsby Cables, Ltd., in Chicago, is shown in sections in fig. 1; fig. 2 shows the sections of a joint on a similar cable by Messrs. W. T. Henley's Telegraph Works Company, Ltd.; and a 300,000-circ. mil, 3-core, 36-kV joint installed in Boston by the Società Italiana Pirelli is shown similarly in fig. 3.

cent. of the total; this is about 14 per cent. higher than for the two previous years. Elimination of the additional companies included in 1924 would not appreciably affect this record.

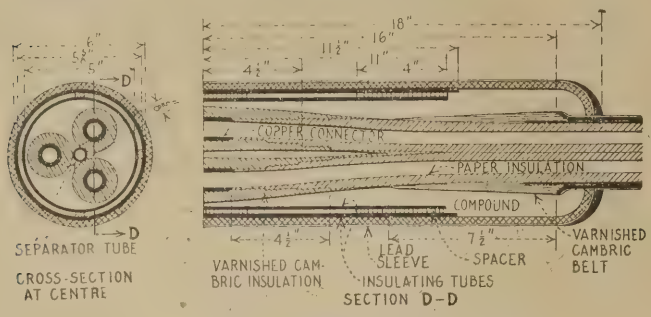

Fig. 4.—Joint on a 33-kW. Submarine Cable.

While the total cable and joint failures in the lower pressure class for 1924 are of the same order as in the previous years, this is not so in the case of the higher pressure cables, in which the total number of failures per 100 miles is not only considerably higher than for 1923, but is also about 18 per cent. above the average for the past six years. Separating cable from joint failures regardless of pressure, 74 per cent. of the failures are in cables and 26 per cent. in joints.

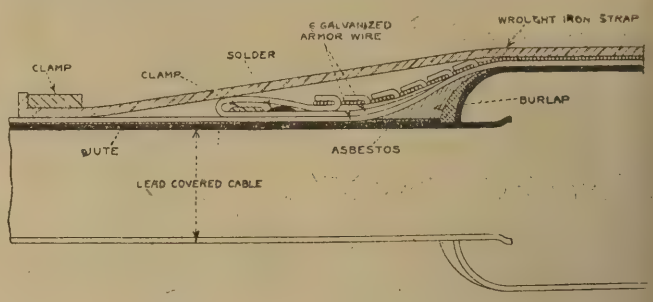

Fig. 5.—Method of Clamping Armouring

Segregation of cable for joint failures, but with respect to the two pressure classes, brings out other interesting information. Joint failures alone in the lower pressure class are only about 3.3 per 100 miles.

High-Frequency Induction Furnaces.

Their Construction and Operation.

By DONALD F. CAMPBELL.

(Abstract of a Paper read before the IRON AND STEEL INSTITUTE.)

THE use of high-frequency currents for induction heating has added a new series of physical conditions to those under which metallurgical operations may be performed. Although still in its early stages of development, it provides an unrivalled means for rapid experimental and research work on alloy steels, and it is being used for several metallurgical operations of the utmost importance. The early work in connection with high-frequency furnaces was carried out by Dr. Northrup at Princeton University, whose brilliant studies on the physical laws governing induction from high-frequency equipment led to the evolution of the first metal-melting furnaces.

Inductive heating has recently found wide application in the non-ferrous trade in furnaces having a vertical slot worked on normal commercial frequencies. But all these furnaces have the disadvantage of requiring an iron core, as the result of which the molten metal is contained in small channels surrounding the core, as well as in the main bath of the furnace. In the case of high-frequency heating, the ideal form of container is available, a cylindrical vessel holding a maximum metal with a minimum of radiating surface and of refractory material exposed to corrosive action. Obviously, inductive heating is superior in thermal efficiency to any arc furnace or fuel-fired equipment, owing to the fact that the heat is actually generated in the charge to be melted.

The high-frequency furnace has an immensely steep heat gradient between the molten metal and the outside of the furnace, the distance between molten platinum at, say, 1,900 deg. C., and a water-cooled copper coil being only ¾ in. in platinum-melting furnaces. This somewhat extraordinary fact does not produce excessive heat losses owing to the rate of input of calories into the charge, and the loss, being a function of time, is only considerable during the last few minutes of the melting operation, when the temperature of the metal is high.

A high-frequency furnace installation consists of a source of high-frequency current, with suitable power factor correction, and a furnace of extreme simplicity of design, but the great disadvantage lies in the difficulty and expense of obtaining the necessary equipment to produce the high-frequency currents. Spark gaps and valves are at present available for small units only; they are not the robust type of machinery desirable for metallurgical works, but they will be gradually replaced or supplemented by ordinary rotating high-frequency generators, as the demand for larger melting units increases. Such machines can now be obtained of simple and substantial construction up to 500 kW capacity, though a high degree of accuracy and workmanship are required in their manufacture, and they are expensive. The frequency required varies according to the size of the furnace and the quality of the metal.

A high-frequency furnace is shown (sectionally) in fig. 1. It consists merely of a container or crucible C placed inside a flat cylindrical coil A. The intermediate space between the coil and the crucible, which generally does not exceed 1 in., is filled with zircon or other insulating material D contained in a silica or mica sleeve B. The crucible or container may be of very thin construction, as it fulfils a different function from an ordinary crucible. If it be ½ in. thick there is a distance of only 1¼ in. between the coil, which is generally water cooled, and the molten metal, which may be heated to over 2,000 deg. C. Thus a greater temperature gradient is obtained than in any other process of melting metals in bulk.

As the heat generated is within the metal itself, the temperature of the crucible is very much lower than that of the metal, and the heat passes from the metal to the crucible, and is not conducted through the crucible walls as in other processes. Consequently reactions between the metal and the crucible walls are reduced to a minimum, and crucibles of material quite inadmissible for melting certain metals by ordinary methods stand well in the furnace. Also, the crucible is supported outside by well-packed ground zircon, and even if a crack occurs there is seldom a loss of metal or any tendency for the crucible to break to pieces. Thus, an ordinary clay crucible, such as is used for gold assays, will make from 10 to 30 heats of nickel-iron alloys containing less than 0.02

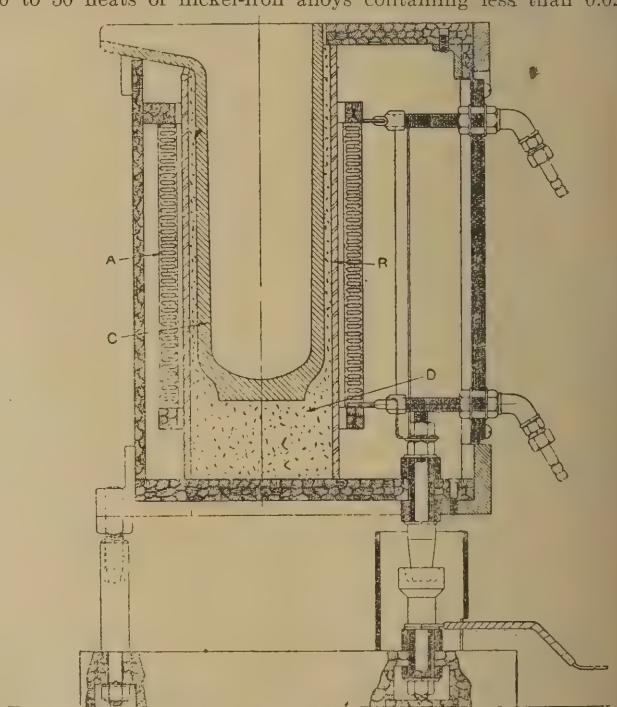

Fig. 1.—Section of High-frequency Crucible Furnace.

per cent. of carbon. This proves that the conditions under which the crucible works are fundamentally different from those of other processes. As the metal container is an ordinary crucible of cylindrical form, there is no necessity to leave metal in the furnace, or to have narrow channels or any of the other features which have rendered the old type of induction furnace uneconomical and obsolescent for the steel trade.

High-frequency furnaces mix the metal intensely, the surface of the molten metal being pronouncedly convex, owing to the violent upward current at the centre of the liquid mass. This is a great advantage for the manufacture of alloys containing metals which do not readily mix, and difficult alloys can be melted with exceptional uniformity. The frequencies used may be termed high or medium, and have varied from 20,000 to 400 periods per second, the lower figures being applicable to the larger furnaces for melting nickel-silver and similar alloys. Furnaces of a capacity of 600 lb. are now work-

ing on certain nickel alloys, and this method of melting is worth consideration by makers of tungsten and cobalt crucible steel, and anyone engaged in the manufacture of alloys of the highest

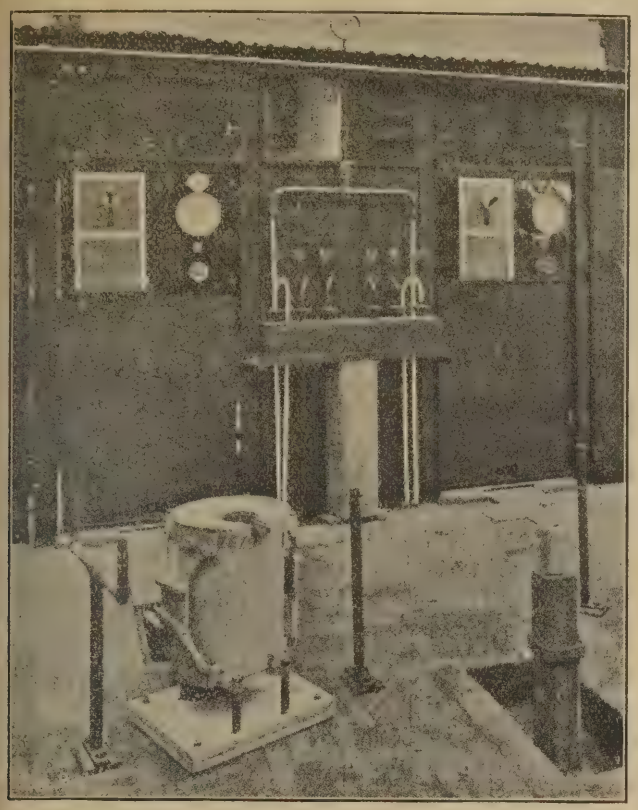

Fig. 2.—High-frequency Crucible Furnace Installation.

quality for electrical work where freedom from carbon is of the utmost importance.

The capital cost of the equipment is at present high, but this may be reduced in the future. The rate of melting is rapid, and the conditions of working are exceptionally clean, accurate, and comfortable for the workmen. The thermal efficiency is high, but the total consumption is in excess of that of good arc furnaces.

High-frequency heating may be found useful in the forging and heat treatment of steel, especially in the case of small objects of irregular shape, as the heating effect is to a great extent independent of the shape of the object submitted to the field. At present the principal application of this method of heating is in the preparation of alloys of nickel and iron with small percentages of other metals, and the lowest possible amount of carbon, which are used for the manufacture of continuously loaded cables. By the use of this metal the speed of signalling on long-distance submarine cables has been raised from a maximum of 300 letters per min. for the old type cable to 1,800 with the continuously loaded cable. This performance was obtained on a cable from the Azores to the United States and has given an entirely new aspect to the economics of submarine cabling, which, coupled with the secrecy and reliability of this form of transmission, ensures extensive demands for a larger production of this remarkable series of alloys.

An installation recently completed in England has by far the largest melting capacity of any high-frequency metallurgical works yet erected. The equipment consists of 42 small converter units, each of 35- to 40-kVA capacity, fitted with furnaces capable of melting 20 lb. of nickel-iron alloys of exceptional purity in 40 to 45 minutes. Two or more converter units may be used on single furnaces of double or treble this capacity. The melting capacity is several tons per day, and a steady and continuous output is being maintained under strictly commercial conditions. As a crucible furnace the equipment illustrated in fig. 2 has many attractive features, and is worth the attention of manufacturers who are interested in the improvement of alloy steels and other metals, especially those which may find wide application in the growing demand for improved alloys in the electrical industry.

The advantages of high-frequency furnaces for research work are very great, owing to the speed with which small heats can be made, either *in vacuo* or in air. In one instance, where an investigation was being made into the properties of a series of alloys with a relatively high melting point, 20 2-lb. heats were made in eight hours. The consequent saving of the investigator's time and the increase in the amount of work he was able to perform were of the utmost importance.

The discovery of the two principal alloys used for cable loading, permalloy and numetal, was made possible by the use of a high-frequency furnace, and further investigations are now being made in several different countries which may result in the discovery of alloys with properties previously unknown.

Electricity in Agriculture.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

(*Abstract of lecture delivered at the* Fabian Summer School.)

As the wealth of any nation is dependent upon the success of its agriculture, it is of great importance to see that the cultivation of crops and the rearing of livestock are put on a sound financial basis. Conditions have changed so much since before the war, that in many respects farming is a new business. The cost of labour is very much higher; taxation is very oppressive; transport in towns is now chiefly mechanical and the horse—which was a big consumer of farm products—has practically disappeared. What has to be effected is to increase the output of each farm per acre and per man. One factor that will very materially assist in this desideratum, is the application of electricity. About a year ago 200 British farmers employed it; to-day there are over 400, and it is to be anticipated that there will be over 800 within another year.

It is not generally appreciated that if the farms of Great Britain were just moderately electrically equipped, they would consume more electrical energy than the total present output of all the generating stations in the country. Here, then, lies an enormous field for the development of electricity supply undertakings.

From the financial point of view, the recent share issues of electric power supply companies have all been over-subscribed. Hence the prospects of a supply to a large section of the farming community seem promising. The load is already there, and the only problem to be solved is how to supply it economically.

One of the great difficulties is that the electrical engineer is not sufficiently acquainted with the practical requirements of the farmer; neither is the farmer enlightened as to the technical stipulations of the electrical engineer, and the implement manufacturer has not yet devoted serious study to the application of electric motors to his machines.

The first and most important use of electricity is for the lighting of the livestock byres and stables; at least half-an-hour per day per man can be saved by the aid of good light. On a dairy farm, the milk that was not accidentally spilled—owing to the existence of good lighting—more than paid for the cost of the light itself. At the present time in Great Britain there are over 50 large poultry farms which employ electric light, while about 90 per cent. of American poultry farms use it; the result is that there is an increase of winter eggs of from 15 to 34 per cent.

There are also possibilities in electric lighting for the market gardener. The author has recently obtained new results of commercial importance. The first was in connection with the transplanting of seedlings, and the second the short-time (one-night) treatment of glass-house plants, to obtain a general and more rapid progress. Ordinarily when seedlings are pricked out, they are apt to fall down and become wilted by the next day; however, when electric light was applied overnight, the seedlings were fresh and vigorous on the next morning—in fact they developed a week's normal growth overnight. With six hours' light each night, daffodils flowered in four days and narcissi in seven days. In other words, the application of electric light had accomplished three or four weeks' growth in four to seven days. The difference in the method of lighting from that which had previously been experimented with was that 1,000-watt ordinary Mazda lamps and large enamelled reflectors were employed, close to the plants, *i.e.*, very intensive illumination.

The next important use of electricity on farms, after lighting, is driving chaffing machines. Taking advantage of the convenience of electric power, many farmers now install cyclone dust extractors. The extraction of dry dust from the chaff is very beneficial to cattle.

The pumping of water is the next important application. The electrical operation of dairy and barn machinery follows as a matter of course, electric ploughing, now quite practical, is developing slowly, but surely.

Electric thrashing, with its 5 per cent. increase in output (due to the steadier running) is the next stage of application of electricity.

There are many ways in which the farmer can expedite work, such as making hay without sunshine and the curing of crops in the rick instead of by stooking on the fields.

Some years ago, in association with the late Mr. W. W.

Hood and Mr. Boyd, the writer assisted in carrying out large-scale experiments to confirm some previous laboratory tests. In 1922, both Mr. Hood and the writer for the first time, took the risk and successfully dealt with full-sized ricks. Mr. Charley Tinker made hay on a large scale in the previous year, but his work was not then known to the others. This work was carried out independently and on slightly different lines.

While the early experiments in artificial hay-making were carried out on a similar basis to that of previous experiments, subsequently changes were made, as the result of modern knowledge of ventilating engineering and scientific procedure, coupled with practical farming experience. This led to the discovery that what was required was cured hay, and not dried grass.

When the matter had been proved a commercial success, first the late Mr. W. W. Hood approached the Ministry of Agriculture and then the writer. Through the enterprise and courtesy of Sir Daniel Hall, the Ministry conducted a number of tests in 1923. Unfortunately the officials in charge did not see fit to follow the instructions of those who had developed the new system, hence the tests were not successful. However, in 1924, after very painstaking and most useful laboratory research during the winter, the technical staff of the Ministry of Agriculture, which had been transferred to the Agricultural Engineering Department of Oxford University, continued the full-scale work. This time they reverted to pre-heating of the air, which had been tried and given up as unnecessary by the earlier experimenters for ordinary hay, though it has advantages for clovers, &c. One of the two ricks thus made proved very successful, even though the method of construction of the rick was not quite correct. Anyhow, the work was sufficient to substantiate the work of what might be termed the modern school of haymaking by artificial methods.

The modern process is essentially of a very simple character and one that any intelligent labourer can carry out once he has been shown how. On the site where the rick is to be built, ducts or covered channels are constructed about ten feet apart, with openings at every ten feet of their length. The rick is built over these ducts in the usual way except that over the openings vertical shafts are constructed that reach about two-thirds up the rick, for the purpose of distributing the air equally. A portable fan is placed at the entrance of the ducts. When the rick is first built, the fan is worked for several hours, to take away the surface moisture. After this preliminary blowing, it is only necessary to blow an hour or so every day for about ten days, when the process is complete. Four years out of five, better hay will be made in this way than by the ordinary method. The whole process is dependent upon ventilating engineering principles.

Corn crops can be treated by the same process, with the further advantageous result that a better milling wheat is produced; a superior malting quality of barley is obtained; and peas can be so cured as to retain their green hue instead of being blanched.

Attention is drawn to the importance of using a special type of motor for agricultural purposes. Long experience on the Continent proved this need, for the habits of the farmers' labourers could not be changed. An agricultural electric motor must stand being left exposed to the weather, artificial manures, dust, uric acid, ammonia, &c. Further it must be simple and foolproof.

Among other problems that the engineer has to solve is the provision of cheaper rural lines; the farmers of South Wales are already setting him an example in this direction.

People talk enviously of the advantage of cheap water-power which falls to the lot of other nations, not realising that the British consumer in larger towns pays far less for his supply than his water-power-provided neighbours. The average price paid by Continental farmers is fourpence per unit for power purposes and eightpence for lighting; but at these prices, it is cheaper than any other source of power or light.

Very little is to be expected in the way of help from any Government. What is rather needed is that legislation should be so modified as to facilitate progress instead of retarding it. As regards finance, electric power supply undertakings can obtain all they require from the public.

Recently the chairman of a large electric power supply company stated that it was not practical politics to consider supplying the farmer, as it would cost at least £300 to tap the power lines. About the same time the writer heard from an Italian engineer, who was sorrowful because he could not see how to reduce the cost of his switchgear, for the same purpose, below fourteen pounds. There is a wide margin between these two figures. The latter is undoubtedly on the low side, but it indicates that a reasonable cost need not be very much more.

It must be borne in mind that in providing the farmer with electricity, the nation is benefited, for the farmer is one of the main sources of national wealth. Hence it is not entirely an unselfish matter to forward the plea for a more complete rural electrification.

Admiralty Electrical Inspectors' Salaries.—An award has just been published by the Civil Service Arbitration Court relating to the salaries of inspectors of various trades in Admiralty establishments. It is decided that the salary scale of inspectors of electricians, telephones and mains (Electrical Engineering Department), shall commence at £150 and rise by annual increments of £10 to a maximum of £220, plus the Civil Service bonus.

Proposed New Australian Tariffs.

THE *Board of Trade Journal*, dated September 10th, contained a full list of the proposed alterations in the Australian import duties. From this list the following information is abstracted. The rates are given as percentages *ad valorem*, except where specially mentioned :—

Item.	Description.	Old Rates. British preferential tariff.	Old Rates. General tariff.	New Rates. British preferential tariff.	New Rates. General tariff.
170 E.	Coal-cutting machines	free	10	free	free
176 E.	Mining machinery ...	27½	40	40	55
178 B.	Cylindrical boilers, 6 ft. and over external dia.; water-tube boilers; boiler furnaces; gas producers	27½	40	27½	40
178 C.	Steam condensers; cylindrical boilers under 6 ft. ext. dia., but not less than 4 ft. 6 in. ...	27½	40	35	55
178 D.	Motive power machinery and appliances, n.e.i. ...	27½	40	45	60
179 B.	Electrical fittings, consisting wholly or partly of metal, *viz.*, switches, fuses, and lightning arresters	27½	40	35	50
179 C.	Regulating, starting, and controlling apparatus for all electrical purposes, including distributing boards and switchboards, n.e.i.	27½	40	35	50
179 D.	Dynamo-electric machines :—				
	(*a*) up to and including 75 kW	27½	40	45	60
	(*b*) n.e.i. ...	27½	40	40	55
	Static transformers and induction coils	27½	40	35	50
	Electric fans ...	27½	40	27½	40
180 D.	Filament lamps for lighting and heating (per lb.) ...	1s.	3s.	free	2s.
180 E.	Wireless receiving sets	not specified		35	55
180 F.	Electrical and gas appliances, n.e.i. ...	27½	40	27½	40
181 A.	Valves for wireless telegraphy and telephony	not specified		free	15
181 AA.	A.c. recording watt-hour meters, each or *ad valorem*, whichever is higher	35	45	{ 10s. / 35	15s. / 45
419 E.	X-ray transformer apparatus (except that designed exclusively for deep therapy)	free	20	27½	40
419 F, G, & H.	Various other X-ray appliances ...	free	20	free	20
380 B.	Household vacuum cleaners	30	40	free	free

"Bull" Motor Curves.—Referring to the characteristic curves of the "Bull" motor published in our issue of July 3rd, a correspondent informs us that as the b.h.p. curve has no indication as to whether it refers to the power developed at full field or otherwise, he worked out a few points from the torque and speed curves given for each case and found that the power curves at full field and with 34 per cent. diversion were exactly the same, showing the efficiencies in each case to be equal. We are informed by Messrs. E. R. & F. Turner, Ltd., that as the result of about seventy accurate tests on the machine from which the curves were taken, and a number of other tests on slightly different machines, it was found that the actual difference in efficiency between full field and diverted field conditions amounted to only about 3 per cent., the full field condition being the most efficient. As the difference was so small, only one efficiency line and one b.h.p. line were shown in the characteristic curves. These represent a mean between the diverted and full field efficiencies. It will be appreciated that there is little value in working one's calculations to fine limits when rolling resistances, due to varying road conditions, can only be predicted approximately.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Improved Coal Meter.

The "Lea Cubi-Meter," illustrated in fig. 1, is a recent production of the LEA RECORDER CO., LTD., 28, Deansgate, Manchester, embodying, it is claimed, the advantages of both the Lea V-notch water recorder and the Lea coal meter. It differs in principle from the Lea recorder in that the velocity of flow is an artificial one, equalling the speed of the conveyor, and is not due to gravity. The machine is driven through a worm gear driving the main axle on which the conveyor by which

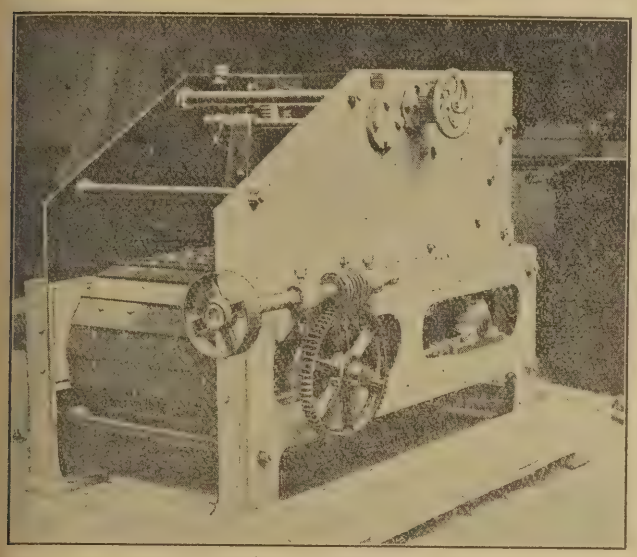

Fig. 1.—The Lea Cubi-Meter.

the coal is carried travels. The "flow" or rate of delivery of the coal is fixed by limiting the depth of the fuel as it passes through the machine. This is done by means of a regulator door which can be raised or lowered. Fig. 2 illustrates the principle of the device. The chief feature of the apparatus is the registering mechanism. A measuring door is hinged in such a way that its lower part rests on the surface of the layer of fuel passing through the machine, the angular position of the door or "flap" being determined by the thickness of the layer. A cam moves with the flap and operates a horizontal rod, varying the position of a counting pinion, attached to the rod. This pinion is geared with a toothed cylinder which

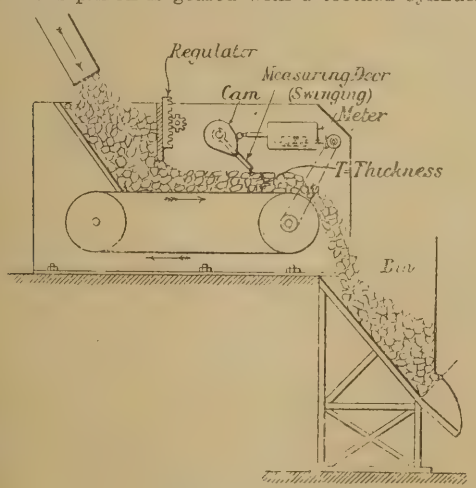

Fig. 2.—Diagram of Arrangements.

is chain-driven from the conveyor shaft, with the speed of which its speed is in proportion. The teeth on the cylinder are reduced spirally towards the "low position" end so that the number of teeth which engage with the counting pinion is proportional to the distance which the pinion has travelled along the cylinder and hence to the thickness of the coal. The number of revolutions made by the pinion is thus in joint proportion to the speed and thickness at which the coal travels through the machine. The counting pinion is, of course, connected with suitable registering mechanism. It is claimed that this method of measurement of coal gives results which are comparable with any of the usual routine measurements adopted.

A New Street Lighting Reflector.

We illustrate herewith a new street lighting reflector, the "Rodalux," which MESSRS. THE BENJAMIN ELECTRIC, LTD., Tariff Road, Tottenham, N.17, have recently put on the market. It is of an unusual "inverted U trough" construction which, it is claimed, ensures a uniform illumination of the roadway for a considerable distance, and by which projected illumination is obtained up and down the road, allowing a much wider spacing between lighting points. It is made of stout-gauge steel, heavily vitreous-enamelled black outside

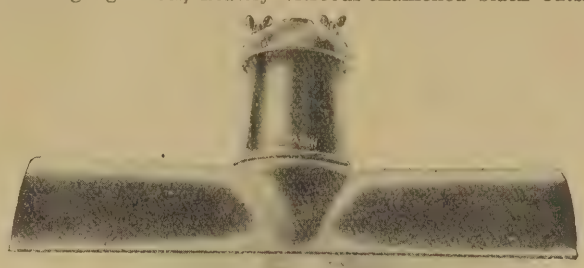

Fig. 3.—The "Rodalux" Reflector.

and white inside. It is equipped with a specially designed porcelain bayonet cap or Edison screw lampholder, supported by a heavy cast-iron weatherproof flange bush. Its dimensions are 1 ft. 9 in. long by 11 in. high.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

The Manufacture of Induction Motors.

With reference to Messrs. F. and A. Parkinson's advertisement which appeared in the September 4th issue of the ELECTRICAL REVIEW, wherein they claim that they manufacture 25 per cent. of all a.c. industrial motors manufactured in the United Kingdom, we should be much obliged if they would let us know:—

1. How their estimated output of competitors' factories is arrived at, as we know of no source from which this information could be obtained.
2. What machines do they include under the heading "Industrial Motors"?
3. On what period of time is their estimate based?
4. What is the horse-power of the range of the machines covered by their claim?

As Messrs. Parkinson well know, any manufacturer could, with the greatest of ease, if he were so inclined, make an exactly similar claim to the one they have made, and we feel sure that if they can substantiate their claim they will be only too glad to do so, otherwise we presume we shall hear no further of it.

The Crypto Electrical Co., Ltd.
(J. G. SHAW, *Managing Director.*)

London, *September 14th*, 1925.

The "Davidson" Dust Collector.

In the paper on the Southampton electricity undertaking, read by Mr. W. G. Turner, A.M.I.E.E., before the British Association, and published in abstract in your current issue, reference is made to a "Cyclone" dust collector which is to be fitted to the steel chimney for the boilers shortly to be erected.

The use of the word "Cyclone" in connection with the "Davidson" patent flue-dust collector, which is the apparatus referred to, is really a misnomer, as the Davidson collector is designed upon entirely different lines and bears no resemblance whatever to the ordinary dust collector known as a "Cyclone." The "Davidson" patent flue dust collector in question consists of two distinct parts, *viz.*, first, a separator having perpendicular sides and of volute portion in plan, and secondly, a collector comprising an upper volute portion and a series of truncated cones and cylinders arranged below.

This flue-dust collector is supplied in other types to suit local conditions, space being usually the controlling factor; thus, in some cases the collector alone is applied, while in others a combination of the two forms of apparatus above described is employed.

It is, therefore, quite apparent that there is no similarity between a "Cyclone" and a "Davidson" patent flue-dust collector, which has proved its efficiency by collecting, under actual working conditions, from 30 lb. to 500 lb. of dust per hour, the quantity, of course, depending upon the quality of the fuel used.

Davidson & Co., Ltd.

Belfast, *September 9th*, 1925.

[The term "Cyclone" was used by the author of the paper. —EDS. ELEC. REV.]

Charges for Electricity Supply.

I have read with much interest the replies to my previous letter on the above subject. I am sorry to note that in view of my small consumption, I am considered a nuisance and an unprofitable consumer. I may say that my consumption of gas for the quarter was proportionately small, but the gas department did *not* double the price per B.th.u. on this account.

I note that Mr. Walker states there are several items in connection with the electrical installation, such as meter, mains, &c., which have to be paid for. Does he infer that the gas mains and meter, also the cooker, were presented to the Cor-

poration by a benevolent manufacturer for propaganda purposes?

I thank Mr. Walker for pointing out that if I took the whole of Barton's output, I might get my "juice" at ¾d. per unit, and I might be delighted to act on his advice, and install an electric cooker and radiators if I could afford them, but I fear that by the time these things were paid for, I should be unable to compare electrically and gas-cooked joints of meat, as meatless days would be the order of the day for some time to come, seeing that my means are strictly limited. In any case I prefer a coal fire.

It may interest Mr. Walker to know that I have several friends in the Eccles area who are on a straight "Pay for what you consume" basis at less per unit than Manchester and no "Minimum Charge." Remarkable for a small place like Eccles, isn't it?

May I quote an example of what is happening in Manchester? One of my neighbours was away for some considerable time during the quarter and his consumption was *four* units: the charge for this was ten shillings. Perhaps Mr. Walker will forward this gentleman some "Trylites" so that he can investigate how "juice" could possibly cost 2s. 6d. per unit, or alternatively forward me some advice how to convince this gentleman and countless others who object to paying "summat for nowt" that they are receiving fair treatment.

The "Minimum Charge" and the "Norwich Charge" are far too high for moderate-sized houses such as mine, where more than one lighting point is seldom in use. It is undoubtedly astounding to people who economise in light, to find at the quarter's end that they have just as much to pay as the people across the way who go to bed and inadvertently leave the hall light on all night.

Stung.

Manchester, *September 10th*, 1925.

Choosing and Using an Electric Washer.

I have found your article on "Choosing and Using an Electric Washer" very interesting reading, as I consider electric washers to be one of the important pieces of equipment for a farm house. In fact, as Mr. C. T. Allan stated recently at the first British Electro-Farming Conference at Chester, it is a favourite method of the South Wales Power Company when attempting to secure a farm load, to get hold of the farmer's wife through a washing machine—and the rest follows.

There seems to be a great deal of sales psychology mixed up with the selling of washing machines. There is no getting away from the fact that undoubtedly these are extremely useful, saving much labour and money. However, their use is not learnt without a little enthusiasm. It is a remarkable fact that second-hand washing machines usually fetch as many shillings as they cost in pounds, owing to the lack of salesmanship. Undoubtedly the manufacturers sell just as easily at £40 or so, as at half this figure; so I suppose they fall into the temptation.

On the Continent it is now a rare thing to find a farm house without an electrically-driven washer, and many of these only cost about £10. They are certainly not quite as refined as American machines, but they do their work efficiently. It seems to me that both washing machines and electric cookers still have to be handled efficiently. I think if your correspondent "Wren" were to write his experiences in choosing and using an electric cooker he need only delete "washer" and substitute "cooker," and what he has said would almost do.

If he does investigate electric cookers, he might also look into gas cookers, and see how many different makers would supply him with a modern type known as the "New World" cooker, wherein lies an object lesson for the makers of electric cookers.

R. Borlase Matthews.

East Grinstead, *September 7th*, 1925.

Super-Pressure Electric Cables.

In a book recently published by Mr. Del Mar on "Electric Cables," the subject of "Intersheath" cables is dismissed in four lines, chiefly on the basis of the statements by Clark and Shanklin in their 1919 paper. It may interest your readers to know that I traversed, in the paper which I read in January, 1925, before the J.I.E., the four statements (a, b, c, d) by Clark and Shanklin, and have given a complete answer to each one.

The most serious charge that they made is "high dielectric loss." Surely it is now time that technical engineers, generally, should accept the elaborate tests, extending (off and on) over a year, made on a working size of cable and under working conditions, by one of the foremost cable companies in the world, rather than a conjecture which was probably not based on any tests at all, but merely thrown out by parties (however eminent) who were conducting tests in a rather different direction.

I am not blaming Mr. Del Mar; he could not have seen my paper at the date of writing his book; but I want to call attention to the misrepresentation of facts conveyed—no doubt quite unintentionally—by Messrs. Clark and Shanklin's statements, who, I am sure, would be the first to correct them, on presentation of the facts.

Particulars of my tests were published in *The Electrician* of June 5th, 1925.

A. M. Taylor,
Major, S.O.2.

The

Electrical Review

VOL. XCVII. SEPTEMBER 25, 1925. No. 2,496.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone Nos.: Central 8260 and 8261

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Electrical Development Propaganda.

AT the present moment when, we presume, the plans of the British Electrical Development Association for intenser operations are in course of preparation, it may be profitable to draw attention to the very big electrical propaganda effort that commenced in the United States in the month of September. It is described by the *Electrical World* as a "nation-wide plan," launched by many electric light and power companies, assisted by the National Electric Light Association, to "carry the central station industry's story to the public." Every month during the coming year consumers of electrical energy will receive a four-page pamphlet explaining certain important features of the industry. "Envelope-stuffers" of approved form will carry messages with every consumer's account and with every electricity supply shareholder's dividend coupons. Down to the middle of August five million of the "envelope-stuffers" had been ordered and 500,000 sets of a series of pamphlets—indeed, under the scheme, 67,000,000 separate messages will be placed in the hands of customers and stockholders during the twelve months ending with August, 1926. We can quite believe that the claim that this is the largest single piece of publicity work ever undertaken by any industry, is correct, and it is safe to agree that it promises to be of inestimable value to the electrical industry in clarifying some questions which are obscure to the public mind, for the closer the relations existing between electrical organisations and the public whom they serve the better it will be for both.

The questions discussed in the American pamphlets and folders are not such as we are in the habit of seeing dealt with in our electricity supply publicity literature. in which are set forth the advantages of electrical service in the home, or particulars of cooking appliances, electric fires, washing machines, &c., or reasons why everybody should make better and more generous use of electricity as an illuminating agent. The kind of information given in this particular propaganda movement may be indicated by a reference to one example entitled "Yes! Grape-fruit is cheap in Florida." The suggestion that one could run down to Florida and get a grape-fruit for nothing is met with the retort: "That's a good idea; the car-fare is only $57.16," the thought

carried home being that while it costs only 20 per cent. of electricity's selling price to manufacture it, it requires 80 per cent. for delivery cost, taxes, interest on investment, and service; another fact driven home at the same time being that, while the average cost of all other commodities has gone up 65 per cent. since 1913, the electric light and power industry has actually lowered the cost of its commodity during the same period; a third thought that emerges is that "it is better for Government to govern and let business be run by business men." One pamphlet bears a title which excites the interest of people who have been led to think on the subject of generation at the pit's mouth: "Why not generate all electricity at the coal-mine?" Another title asks: "Why did 860 municipally-owned plants close down?" and so on. The folders for stockholders are entitled: "What is a Holding Company?"; "What is Super-power?"; "What About Service at Cost?"; and "If All the Streams were Harnessed."

These educational efforts make it plain to the "common people" that, while electricity is a magic thing, "very stimulating to the imaginations of orators and self-appointed friends of the people," "it is the business men who have built up the electrical industry," and they are not "overlooking any bright ideas," but "are alive to every possibility of reducing costs and improving service."

It will be recognised that extensive as the foregoing scheme is, it is only part of the larger educational and general electrical development campaign that has been in progress in the United States, at enormous outlay compared with what is spent here, for some years past. Prognostications respecting the rate of electrical development during the next five or ten years across the Atlantic produce a huge total in additional capital outlay for the electrical industry and in revenue for supply companies and investors. True it is that the field there is much bigger than that in which we operate here, but the leeway to be made up and the great headway that we are justified in anticipating during the same period should together give us a larger rate of advance with advantage to every section of the electrical trade and with benefit to the community. If only the industry, with its 500 or 600 millions of capital invested would take an enterprising plunge suited to its ability and its opportunity, electrical ignorance among millions of dwellers in the British Isles would be dispelled, interest would be aroused, electrical service would rapidly extend, and a continuously progressive and larger return would come far sooner than it is likely to do if we continue to be satisfied with a little activity where much is justified.

Analysing the Domestic Budget.

AFTER analysing the sales of electricity and electrical appliances to wired houses in about 60 representative towns in the United States, *Electrical Merchandising* comes to the conclusion that the American public does not yet take its electrical expenditure very seriously. It was found that electricity for home use accounted for an expenditure of $30 per annum for each wired home, while the expenditure upon appliances was $10.88. To indicate the low plane upon which electricity finds itself, our contemporary goes into further details of domestic expenditure, and finds that each family spends an average of $420 per year upon automobiles and supplies; $236 upon women's clothing; $100 upon tobacco; $60 upon theatres and "movies"; $25 upon "radio"; and a great deal on other non-essentials, while electricity is well at the bottom of the list.

We do not know how the figures are arrived at, but they have made us wonder what a similar analysis of British domestic expenditure would look like. While, no doubt, taxation would figure very largely, we are quite certain that electricity would still be at the bottom—in fact it would only just come into the list. If Americans consider that there is such a wide scope for electrical expansion in their country, what are the conditions in Great Britain?

The analysis makes it apparent that a great deal remains to be done in the way of educating the American public to the benefits of electricity, and it can be taken for granted, if any further indication is needed, that there is still greater room for development in this country.

The Trade Facilities Acts.

THE statements of proceedings under the Trade Facilities Acts, issued by the Treasury, have certain points of interest for our readers, both manufacturing and electricity supply. The interest to electrical manufacturers lies in the big proportion of loans which have been devoted to electrical enterprise and which should give a corresponding stimulus to business. Certainly over, say, £20,000,000 appears to be allocated thus. Then as to the electricity supply industry, one interest may lie in the fact that with the extended provision in the Act of 1925, the Advisory Committee has a balance unallotted of £15,547,064 (according to the figures of the last Treasury statement), so there is still room to entertain further applications. It is perhaps a little surprising that the industry has made so little use of the Acts, seeing that out of the 225 supply companies, the majority of which are small companies, only 14 appear in the lists. The nature of a supply company entails a constant capital expenditure, and probably three-quarters of the companies in the country have to depend on local or individual capital, making the question frequently an anxious one. One would have anticipated, therefore, that from an industry of this kind there would have been almost shoals of applications. One thing, possibly, may have militated against the making use of these guarantees, namely, the fact that the difficulties of capitalisation in the past have sometimes involved companies in complicated finance which precludes their giving a first charge or something equivalent as security as required by the Advisory Committee. Still, in the case of public utility companies, the Advisory Committee may possibly be coaxed into a little elasticity of procedure where the loans are required for sound and remunerative extensions of operation. We see that the North Wales Electric Power Co. has taken up a loan of £1,700,000 to cover its programme of exercising the operating powers of the Joint Electricity Authority constituted for the North Wales and South Cheshire Electricity District. It is for part of a similar programme for the South-West Midlands Electricity District scheme that the Shropshire Power Co. has also received a loan of £700,000. Now that further of these reorganisation schemes are ripening into action it may be that similar assistance will be solicited. Anyhow, the existence of such provision of capital ought to give a fillip to the spirit of enterprise in electricity supply companies, both singly and co-operatively.

Electrical Trade Abuses.

A "MASS MEETING" of Manchester district electrical contractors, manufacturers and wholesalers has been summoned for 2 p.m. on Monday next at the Rooms of the Manchester, Salford and District Building Trades Employers' Association, 10, South Parade (St. Mary's Parsonage), Manchester.

The object of the meeting is further to consider a report which has been prepared by the sub-committee and the main committee after a long series of meetings held to inquire into certain well-known abuses in the trade—particularly in their local application—and if possible to bring about better conditions of trading generally. The first meeting of representatives of manufacturers, wholesalers and contractors took place a year ago. It was very well attended, and whilst recognising that the three sections of the trade had their own organisations and that a national policy was preferable to a parochial one, it was felt that if local representatives of the three sections of the trade could meet together, a better and more harmonious condition of things might be brought about, and that suggestions

emanating from such an important section of the industry as was contained in the Manchester and district area would be of more than local benefit. A committee consisting of six representatives of each of the three sections was appointed, but eventually the matter was referred to a sub-committee of six gentlemen, and it is the report of these six that will come under consideration at Monday's mass meeting.

The Engineering Industry and Over-Capitalisation.

At the recent meetings of the Trade Union Congress references were made to the subject of over-capitalisation in industry. In this connection it is useful to recall that early in the present year this matter was dealt with in a special Memorandum by Mr. D. A. Bremner, Director of the British Engineers' Association, submitted to the Balfour Committee on Trade and Industry. This statement was briefly alluded to in our issue of April 17th, 1925 (p. 614), but those who are interested in the recent discussions would do well to study the particulars set forth in the B.E.A. summary of its investigation where watered capital, over-capitalisation, and bonus share distributions came under discussion. An analysis was given showing the relation of these financial operations to some 31 companies connected with the engineering trades, and the result of the investigation was to show that the engineering industry was exceptionally free from watered capital and that the chief cause of over-capitalisation had been the slump in capital values consequent upon the fall in price levels since the post-Armistice boom. This cause, it was held, had probably had more than an average incidence on the British engineering and metal industries. The Memorandum added that there were no grounds for attributing the state of the engineering industry to unsound financial policy; the chief causes of the depression were held to be our high costs of production and distribution and the under-consumption of our export markets.

The Austrian Electrical Industry.

It is stated that, apart from the orders given in connection with the electrification of the federal railways and the construction of hydro-electric works, the situation of the Austrian heavy electrical engineering industry in general is not favourable. In the lead cable branch some revival has taken place, as the postal authorities have placed orders for one-half of the telephone cables which are required for the line between Vienna and Passau, the first long-distance line in Austria, and one which will connect with the German network at Passau. Business in insulated conductors and windings is reported flat, and the wireless apparatus branch is also depressed, although a revival is expected in the near future. The other branches of the electrical industry likewise are suffering from the general economic crisis. The treaty of commerce with Jugo-Slavia has been the means of effecting some reductions in the Customs tariff, although the duties are still higher than before the introduction of the new tariff. Business with Poland labours under the difficulty of the depreciation of the zloty, while the absence of a treaty of commerce with Hungary has a disturbing effect on exports as the autonomous Hungarian tariff almost completely prevents the importation of electrical products into that country.

Public Lighting.

The Institution of Public Lighting Engineers held a very successful conference at Leeds last week—the second annual meeting—and may be regarded as fairly launched on its career of usefulness. Like the Illuminating Engineering Society, it brings electrical and gas engineers together for the discussion of their common objects and in friendly rivalry; and whilst we do not regard with favour the multiplication of specialist societies whose functions can be efficiently performed under the ægis of existing organisations, the test of survival cannot be gainsaid—if a new society is not needed, it will perish of inanition. It would appear, therefore, that the Institution fills a want.

That the subject with which it deals is very much alive may be inferred from the fact that during the last year or two great improvements have been effected in street lighting apparatus, and the author of one of the papers remarked that since it was written progress had been made which already necessitated notable modifications in his conclusions. The new president, Mr. C. S. Shapley, in his inaugural address, observed that he had been disappointed with the results of "directional beam lighting" in one of the main thoroughfares of Leeds, and that it was sometimes advantageous in street lighting to sacrifice illumination for effect; moreover, he thought the horizontal illumination test did not give a true measure of the available illumination. There is a great deal more in these remarks than might appear at first sight. When one is dealing with purely physical problems the teachings of science can be applied with confidence; for instance, the energy required to maintain an electric lamp at normal incandescence for a known period can be predetermined with a high degree of accuracy. But the moment we go from physics to physiology precision ceases to have a meaning. The main purpose of street lighting is to enable the human eye to function after sunset, and whilst the degree of illumination produced can be defined in various ways, and measured in accordance with those definitions, the final criterion not of its efficiency but of its efficacy must necessarily be the effect produced upon the human organism, which is incapable of measurement. As an example of the inadequacy of ordinary scientific methods in such cases we may cite the experience of a speaker at the conference, who said that at a well-lighted and important crossing a policeman in white clothing was nearly knocked down by motor-cars on several occasions; it was found that he was safer in his blue uniform. Evidently there is a great deal yet to be learnt about public lighting.

The Development of Electricity Supply.

Opening an extension of the Keighley electricity works last Saturday, Mr. Philip Snowden once more expressed his views on the subject of electricity supply. We are sorry to learn that he thought the industry was still in its infancy—when will that pernicious phrase be dropped?—but we may forgive him the platitude in view of his robust and well-grounded faith in its triumphant future. The age of steam, he said, had left us a legacy of social problems; he looked to electricity to spread our population over the country, with immense benefit to the community. He rightly attributed the delay in electrical development mainly to the parochial policy followed in the past, and advocated legislation "on an ambitious scale," supplemented by State financial aid.

As a general rule, it is pretty safe to say that any remedy proposed by a politician for a social or industrial disorder is more likely to be one of the many wrong cures than the right one. Here we have Mr. Snowden recommending a larger dose of the same kind of medicine that stunted the growth of electricity supply when it really was in its cradle—legislation—and sugaring the pill with "a large expenditure of public money," another favourite nostrum of the professional politician. There are many members of the electrical industry who believe that its chief need is to be free from interference and to be permitted to develop on its own sound lines; that the only legislation that is likely to be of benefit is the repeal of the past legislative errors, but, unfortunately, the mischief that has been done cannot so easily be undone. If legislation there must be, let it be directed to removing the obstacles that have been built up, and smoothing the path of development. Electricity is no hot-house plant needing artificial coddling; neither is it the panacea for all social evils that it is represented to be by Mr. Snowden and other politicians. We are with him in the end to be attained, but we doubt the soundness of the means by which he would get there—*timeo Danaos*. . . .

High-Power Mercury Arc Rectifiers.

The Automatic Control of Sub-station Plant.

By R. L. MORRISON, A.M.I.E.E.

Automatic control, though still in its infancy, has made considerable strides during recent years, and to-day we find that a large proportion of the control of machinery installed in factories, workshops, &c., is more or less automatic. It is found that properly designed automatic apparatus with little supervision is not only more reliable in its functioning than hand control, but also is freer from breakdown and therefore more dependable.

A very large number of the low-pressure distribution systems at present in being utilise direct current which is supplied through the medium of rotating converters or mercury arc rectifiers. In the case of traction systems it is now generally conceded that this form of supply is the most suitable. Semi and fully automatic control of such converting plant has been very highly developed, the precise form of control being designed to suit local requirements. The more usual forms at present in use are:—

(*a*) Control by time switch.

(*b*) Control by predetermined line conditions, such as maximum and minimum pressure limits.

(*c*) Push-button control from a central point, which can be extended by the addition of signalling back arrangements to enable the control engineer to follow the sequence of operations.

By the use of a suitable selector switch and the provision of the necessary relays, it is possible to combine all the above methods of control in the one plant, or, on the other hand, to include any special requirements that may be desired to suit local circumstances. From this it will be understood that the provision of automatic features is to a large extent flexible, but naturally the precise requirements must be known when the design of such plant is undertaken.

In point of simplicity the automatic high-power mercury arc rectifier is unapproached by any other form of converter. The number of relays employed with the automatic rectifier is very considerably less than, for instance, with the automatic rotary converter, and those that are used are of the simplest possible character and have been tried out for a long period of years under the most exacting conditions. It is not proposed here to give a detailed description of the mercury arc rectifier and its functioning—a good deal of information has already been published in the past, and in particular reference should be made to the Electrical Review, February 18th and 25th, 1921, and March 10th, 17th and 24th, 1922; also *Engineering*, October 19th and 26th, 1923. It is sufficient to indicate that the rectifier is a converter for statically transforming alternating into direct current, and as such presents many advantages when compared with the more usual systems employing rotating machinery.

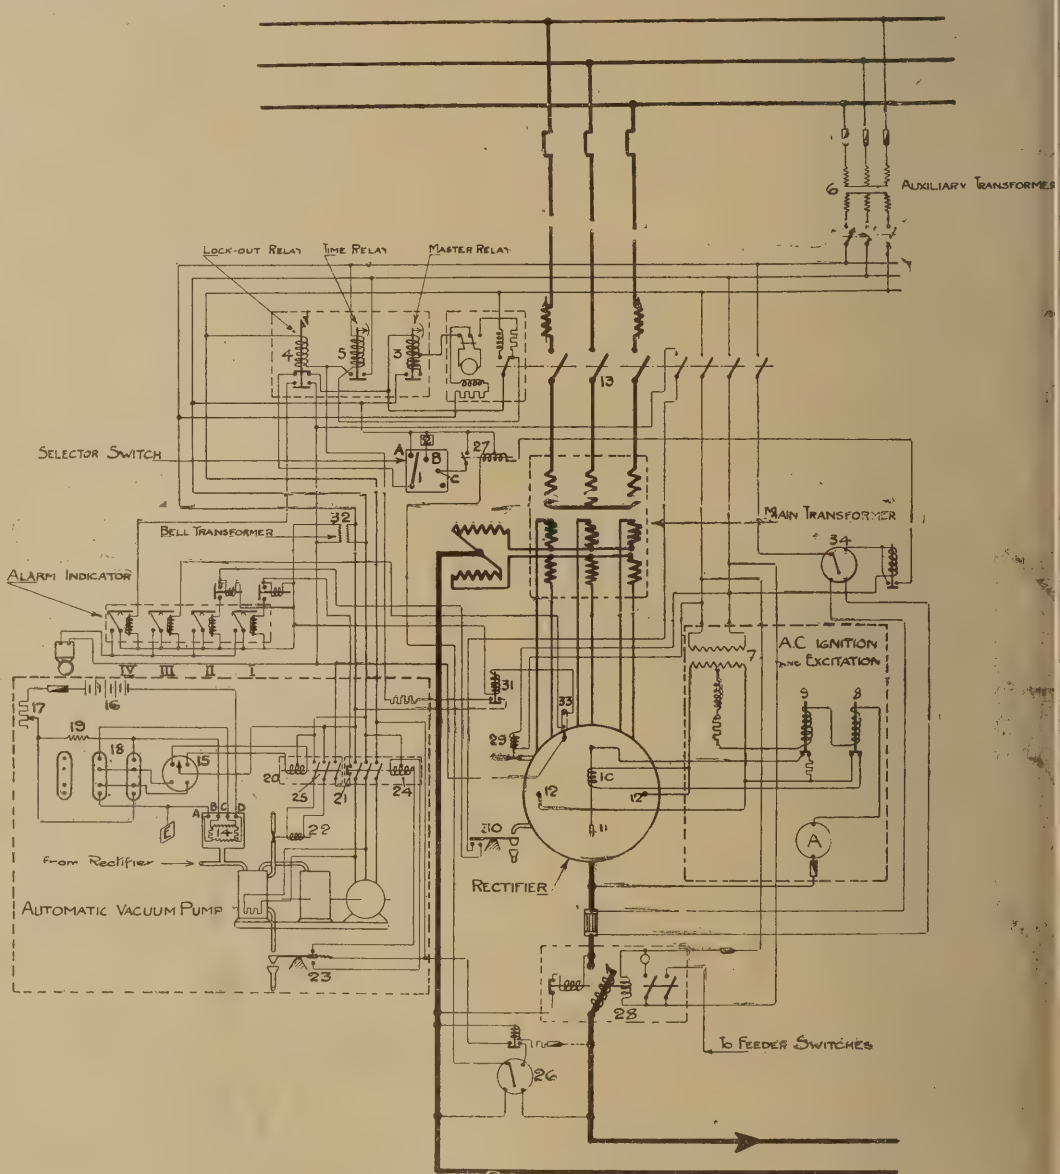

Fig. 1.—Diagram of Connections.

Rectifier equipment consists essentially of three parts:—

(1) A three/six-phase transformer of special construction connected on the primary side to the incoming h.p. supply and delivering its secondary six-phase current to

(2) the mercury arc rectifier, where the conversion takes place due to the valve action of the mercury arc when operating in a vacuum. The six-phase current received therefore at its anodes is delivered at the cathode in the form of a unidirectional current.

(3) The vacuum-pump set which maintains the degree of vacuum necessary to the satisfactory operation of the plant.

Methods of Operation.

Reference has already been made to the different methods of operation that can be employed. All equipments may be considered to be fully automatic in the sense that every relay necessary for the operations of starting up and shutting down in all their stages is provided, and any special alternative or further methods of control that may be desired must be considered as additional to the automatic equipment in its simplest form.

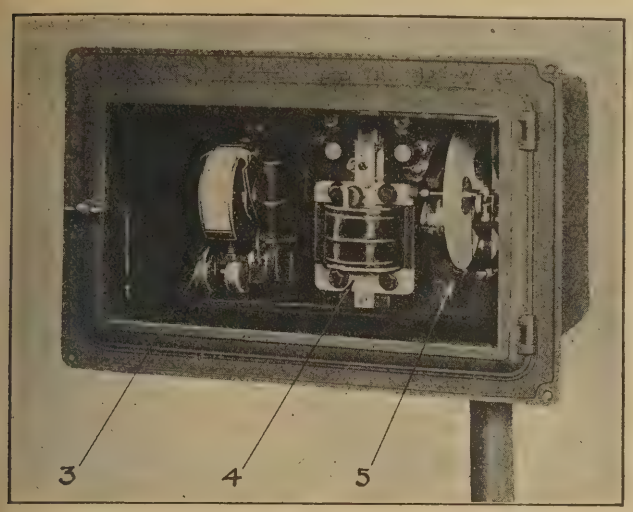

Fig. 2.—Main Relays.

Local conditions generally govern the particular method of control, and the diagram illustrated in fig. 1 shows three alternative forms. A selector switch 1 provides for direct control at sub-station (A), as a function of time (B), and as a function of line pressure and load (C).

The number of relays employed can be increased or decreased according to the degree of control desired. The diagram shown provides an average degree of control without unduly complicating the arrangement, but can be simplified if only one of the above methods is required.

Principal Relays.

The three main relays are embodied in one case, fig. 2, and consist of a master relay, 3, a lock-out relay, 4, and a time relay, 5.

The master relay is a slightly modified form of the well-known Brown, Boveri H-type time-limit overload relay, and controls the motor mechanism of the main h.p. switch. The lock-out relay is of the simple solenoid pattern which permanently shuts down the plant in the event of a continuance of abnormal circumstances, such as a permanent short circuit on the line. The time relay is also a well-known Brown, Boveri type, and operates in conjunction with the lock-out relay, the circuit of which it eventually completes. It is capable of adjustment over a wide range in order that the plant may trip out several times before being permanently locked out.

The few remaining relays are of extremely simple construction, and perform such minor duties that they need not be specially described.

The master relay has a time adjustment, and can be set to prevent the plant being unnecessarily put into service on the occurrence of momentary overloads on the system. On the other hand, where very rapid starting would be an advantage, the relay can be set accordingly and the plant be in service within a very few seconds.

Permanent Automatic Features.

There are two accessory portions of an automatically controlled rectifier equipment which can be considered apart from the rest, namely:—

(*a*) A.c. ignition and excitation which are permanently automatic irrespective of whether the rest of the plant is automatic or not, and

(*b*) The vacuum pump set which is constantly under pressure from the auxiliary transformer 6, and is therefore in a position to operate at any time, thereby maintaining in the rectifier the degree of vacuum necessary. This ensures the plant always being ready to be put on load at a moment's notice.

A.C. Ignition and Excitation.

Prior to the introduction of a.c. ignition the operation of striking the arc in the rectifier was performed with direct current supplied by a separate $\frac{1}{2}$-kW converter. This introduced complications and was expensive, so that the new method of ignition is not only simpler but less costly. The operation of the circuit is as follows:—

When the main h.p. switch 13 closes, the $\frac{1}{2}$-kVA excitation transformer 7 is switched in at the same time. This energises the coil 10 which pulls down the ignition anode 11. With the first positive half-wave or a following one of the same polarity, the arc is struck, and

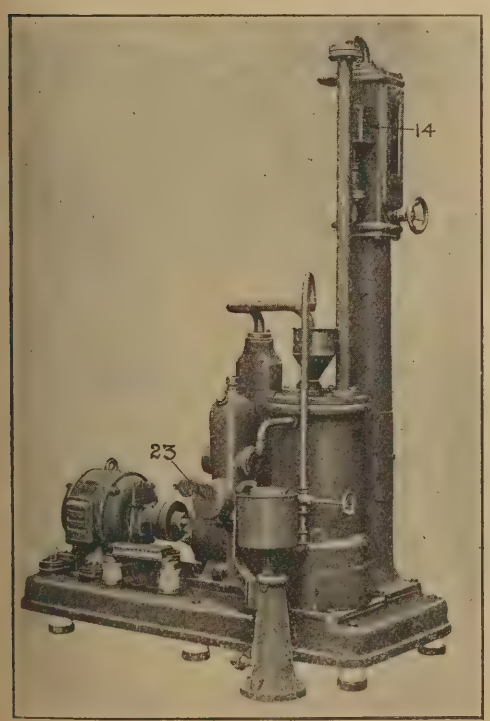

Fig. 3.—Vacuum Pump Set.

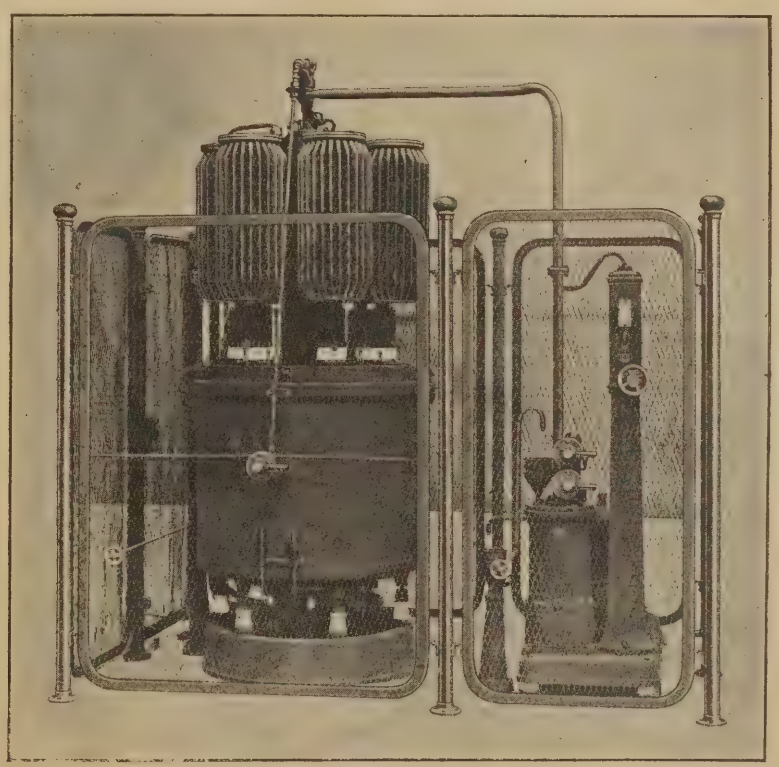

Fig. 4.—High Power Rectifier with Vacuum Pump and Screening.

relay 8 breaks its contacts and thereby de-energises coil 10. As there is pressure across the two excitation anodes 12, an arc is now started between these points and the cathode, causing relay 9 to function and the ignition circuit to be opened. The rectifier is now ready to be put on load.

Vacuum Pump Set.

The modified type of McLeod mercury gauge so well known in connection with these plants has been superseded by a direct-reading hot-wire vacuum gauge. The working principle is based upon the fact that the thermal conductivity of a gas depends upon the gas pressure.

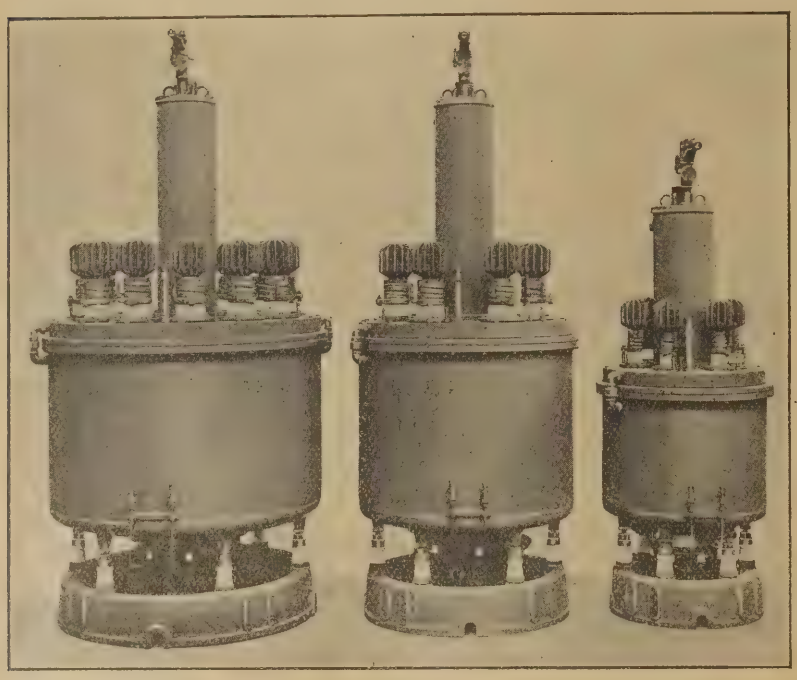

Fig. 5.—High-Pressure Rectifiers.

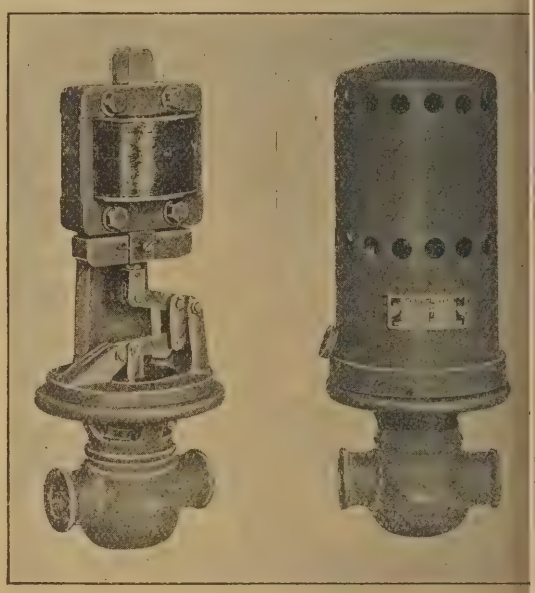

Fig. 6.—Electrically Operated Water Valve.

At the very low working pressures customary with rectifiers, the thermal conductivity is directly proportional to the gas pressure. The gauge 14 consists of four resistances connected as a Wheatstone bridge, two, namely, A D and B C, being in the vacuum, and two, A B and C D, being exposed to the atmosphere, the object of the latter being to compensate for any influence the external temperature may have on the accuracy of the readings. The resistances are electrically heated by means of a small battery 16, the current being adjusted by the rheostat 17 to 152 milliamperes. The branches A D and B C are heated in proportion to the vacuum, their ohmic resistance varying to the same extent, thus altering the potential difference between the points A and C, which difference is recorded on the voltmeter 15. To adjust for the correct current passing through the bridge, the plug is put into the right-hand contacts 18, which measures the drop across the shunt 19, in parallel with points B and D. The plug is then put into the middle set of contacts to record the potential difference across A and C, which is a measure of the vacuum in the rectifier. Through the medium of adjustable contacts on the voltmeter and the split coil 20, the switch 25 opens or closes the circuit of the water valve 22, thus controlling the cooling water supply to the stationary section of the pump. At the same time the tipping switch 23 operates switch 21 through split coil 24, and so connects or disconnects the pump motor. The complete vacuum pump set is shown in fig. 3.

The Operation of an Automatic Rectifier Equipment.

A high-power rectifier with vacuum pump set similar to that referred to in the diagram is shown in fig. 4. The rating of such a unit would depend upon the d.c. working pressure. Roughly, it would vary between 315 and 730 kW, the corresponding pressures being 300 to 750 volts. There are three further types manufactured, fig. 5, the ratings varying between 150 and 2,000 kW at pressures up to 1,800 volts. For higher d.c. pressures up to 6,000 volts the last three types are used, the current ratings in such circumstances being somewhat reduced. These outputs can, of course, be doubled by connecting two rectifiers to a single transformer of double the output.

As has already been explained, in the diagram three alternative methods of control are shown depending upon the position of the selector switch 1. The more usual is for the control to be dependent upon the line pressure either outside the sub-station itself or at some more remote point in the system. The following sequence of operations will therefore be based upon this assumption, and the position of the selector switch will therefore be "C." We will assume that the plant has been shut down; as the load on the network builds up, the needle of the contact voltmeter 26 connected across the d.c. supply closes the circuit of the left-hand coil of the small auxiliary switch 27. The master relay 3, now energised, bridges its heavy current contacts, thus running up the motor control for the h.p. switch 13, which puts pressure on the main transformer. It will be seen that the auxiliary switch for the exciting transformer 7 closes at the same time as the main switch—this ignites the arc and puts the excitation into operation, as has already been described. The rectifier is now under pressure on the d.c. side, and the circuit breaker 28 puts the plant on load through the operating coil connected across the d.c. supply. By coupling a small auxiliary

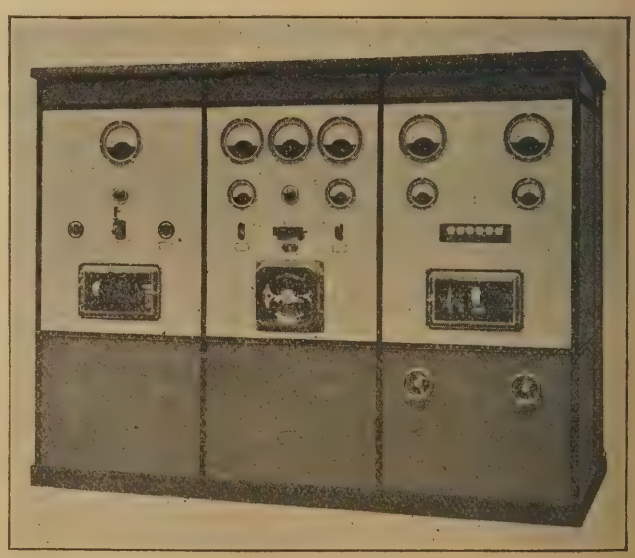

Fig. 7.—D.C. Switchboard for Automatically Controlled Rectifiers.

switch to the circuit breaker 28, the feeders can without difficulty be electrically operated.

To dissipate the heat generated in the rectifier, a small quantity of water is passed through the jacketing surrounding it. The flow of this water is controlled by the electrically-operated valve 29 shown in fig. 6, which opens when the plant is put under pressure on the a.c. side. In the event of the water supply failing when the plant is under load, the tipping switch 30 closes its contacts, drops the indicator II of the alarm device, and sets the bell ringing. Of course, the same operations would take place should the quantity of water be insufficient for the load being dealt with. The auxiliary supply for the alarm circuits is provided by the 8-V bell transformer 32. Should the water remain off for an appreciable time, the temperature of that remaining in the jacketing will rise until contact is made on the first point of the thermometer 33, which drops the indicator III. If the same conditions continue, the upper temperature limit is finally reached and contact made on the second point of the thermometer, thereby shutting the whole plant down through the medium of relay 31 which operates the lock-out relay 4. Indicator IV then drops, showing that the plant is permanently off load and cannot be re-started until the lock-out relay is re-set, which would not be possible until the water supply had been resumed and the temperature in the jacketing reduced below the maximum.

From what has already been said, it will be seen that the whole of the operations involved in the starting and subsequent running of automatic high-power rectifier equipment are exceremely simple, and not in any way involved. The same simplicity is apparent when shutting down, the operation for the method under consideration being performed through the medium of the contact ammeter 34, which cuts the plant out on predetermined minimum conditions being reached.

In the case of large sub-stations requiring more than one rectifier equipment, the automatic features are no more complicated than those described. The various sets are in such circumstances so arranged that as the load increases beyond the capacity of the units on load, others are brought into service and *vice versa* shut down as the load again decreases. The functioning of the relays can be delayed to prevent switching-in where the load variations are only of a temporary character, such as may be expected on traction systems.

General.

The practice of centralising the control of automatic sub-stations is finding favour in certain quarters at the present time. Where the units consist of rotary or motor converters, signalling-back arrangements are provided to enable the engineer in charge to see at a glance that the various sections of the automatic apparatus are functioning correctly. This is mainly due to the multitude and complication of such apparatus, and also to the difficulties inherent to the automatic starting up of converters of that class. On the other hand, it can be very definitely stated that no such difficulties arise with the automatic high-power rectifier, and consequently signalling back to the same extent is unnecessary—in fact, the only indication that might be considered essential would be the load on the sub-station. For control from a central point the selector switch would be on contact "A," with pilot wire connection to the central point.

The automatic features are usually incorporated in neatly designed panels similar to those shown on fig. 7. In this particular case the equipment comprises, in addition, an automatically operated induction regulator for pressure control. The voltage regulator itself seen on the centre panel is of the Brown, Boveri pattern. Immediately above it are the panel mounted parts of the thermal vacuum gauge.

Though the present automatic features are of a simple character, it is likely that in the near future further developments will take place tending to greater simplification, and in that case the details will be published in due course.

Experience has amply demonstrated that the chief sphere of utility of the high-power rectifier is undoubtedly in the direction of conversion for traction and other similar fluctuating load conditions. To date, the capacity of high-power rectifiers installed or on order is well over 200,000 kW, of which fully 80 per cent. is for traction or kindred loads. This is accounted for by the fact that heavy fluctuations are handled just as easily as steady loads, and also that d.c. pressures up to 6,000 V can be obtained in single units. A typical chart of an average day's load on the Turin-Lanzo-Ceres Railway in Northern Italy is shown in fig. 8. This railway is served by an 800-kW power rectifier operating at 4,000 V d.c. The success obtained with the sixteen 1,200-kW 1,500-V equipments on the Midi Railway of France is too well known to need further comment. Furthermore, in various parts of the world several 1,500-V plants are in completely satisfactory operation, while recently the Dutch railway authorities, after careful investigation, decided to equip their sub-stations on the new electrified line between Amsterdam and Rotterdam with high-power rectifiers. Considerable progress has also been made in the United States of America, several units already being in operation, and others in course of construction.

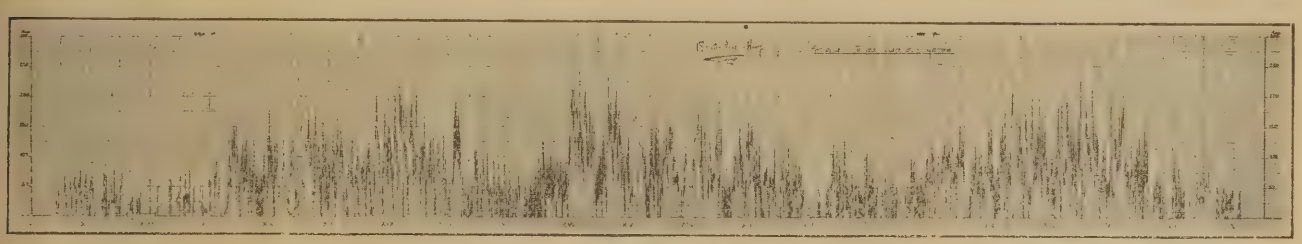

Fig. 8.—Load Chart on Railway Operating at 4,000 Volts D.C.

Reliability and low maintenance charges are outstanding features of the modern high-power rectifier, especially when used for loads similar to those mainly referred to above. In addition, there is the high efficiency obtained with this class of plant especially at the higher d.c. pressures of 1,500 V and upwards. Due to the peculiar characteristic of the rectifier, the overall efficiency remains practically constant from full to quarter load; while the advantage at full load might not be considerable, at the lower loads it is very marked, and as the average load under traction conditions is usually something between a quarter and three-quarters load, a very material advantage is gained by the employment of rectifiers.

The future of high-pressure d.c. railway electrification will be decided largely on the question of satisfactory conversion, and it is the considered opinion of many intimately acquainted with the high-power rectifier that such decisions will depend very much upon its capacity for handling such conditions.

The author desires to thank Messrs. Brown, Boveri and Co. and his firm, Messrs. Power-Rectifiers, Ltd., for the facilities given and information placed at his disposal upon which this article has been based.

Water-Power Education in Switzerland.—Under the ægis of a number of Swiss technical and scientific bodies, and with the financial support of various cantons, arrangements are in hand for the establishment of a water-power utilisation experimental department at the Federal Technical High School of Zurich.

Electricity Supply in Nottingham and District.

The New North Wilford Power Station.

(*Concluded from page* 463.)

Only one alternator is earthed at one time, and the opening of the main oil switch of that machine automatically breaks the earth connection. A red lamp is mounted on the control panel of each alternator, and serves as an indication to the attendant as to which alternator is earthed. Should the earth connection be broken by the opening of the alternator switch, the attendant can earth any other running alternator by closing a control switch. Closing the earthing control switch of any standing alternator, or of one not switched on to the bus-bars, cannot earth that machine. Balanced protection is used on each alternator circuit, with compensated pilot wire protection on each feeder circuit. Excess pressure dischargers have been provided for each section of the switchgear. The extra-high-pressure auxiliary switchgear is built up in steel cubicles on the floor of the auxiliary plant bay. It controls the high-pressure side of the station transformers, and the switches are operated by hand. It is fed by two feeders, through special reactors, from one section of the main switchgear. Each turbo-generator is equipped with a separate synchroscope, which can be put in parallel with the synchronising instrument in the control room by means of a switch on the control panel for the particular machine in question. This is done when a machine is "run up" for paralleling, and the driver himself regulates the set into synchronism from the machine stop valve. The control of the machine governor is arranged from the control room. A system of signal telegraphs from the control room to the machines is installed, and also a load indicator to the boiler house; this is operated by hand to signal by illuminated signs the load on the station, and whether it is rising or falling.

The whole of the steam pipes are of steel, with steel flanges riveted on. They are laid with a continuous fall from the boiler stop valves to large separators at each turbine in the basement. The separators are drained by duplicate float traps, and the flow of the steam and of any condensed water is always in the same direction, up to these points. The atmospheric exhaust branches of the main turbines connect, through automatic valves, to a large steel exhaust tank in the basement of the feed pump annexe. This tank is drained, and a 30-in. atmospheric pipe is carried up above the roof of the annexe.

The bearings of the various turbines are lubricated, under pressure, by gear-driven pumps on each machine. The oil is pumped from settling tanks in the basement, and is returned after passing through duplicate oil coolers. The cooling water is taken from the main circulating system. New oil is brought to the station by railway, and is pumped, through filters, into a common oil storage tank, erected in a corner of the workshop building. The clean oil is pumped from the storage tank into the various turbine tanks, through a pipe line, so that no oil cans or barrels have to be carried into the turbine room.

Oil may be drawn off from any turbine tank, and be pumped up to a dirty-oil tank, erected above the filters. Thence it is passed through the filters into the clean-oil storage tank, where it is ready for filling or replenishing the oil supply of any turbine.

A workshop, 100 ft. long by 60 ft. wide, through which the railway track passes, is situated adjacent to the boiler house. A bay, 24 ft. wide, has been divided off from the workshop by an expanded metal partition, to form the main store-room of the station. Above the battery room a chemical laboratory has been equipped with all the apparatus necessary for coal, ash, oil, water, and other analyses and tests.

Offices, mess rooms, lavatories, bath rooms, &c., equipped with electric heating and cooking apparatus, have been provided for the station staff.

The foundation of the buildings has been constructed as a concrete raft, with concrete retaining walls. The basements of the turbine room and boiler house form a waterproof tank, up to a level above that of the highest recorded flood level. The building is largely a steel-framed structure; the walls are of brick with Derbyshire stone dressings, and the floors are of reinforced concrete. The elevations have been designed of as simple a character as possible, consistent with the size and use of the building. Fig. 16 shows a sectional elevation of the station, and fig. 17 shows the general lay-out of the plant, &c.

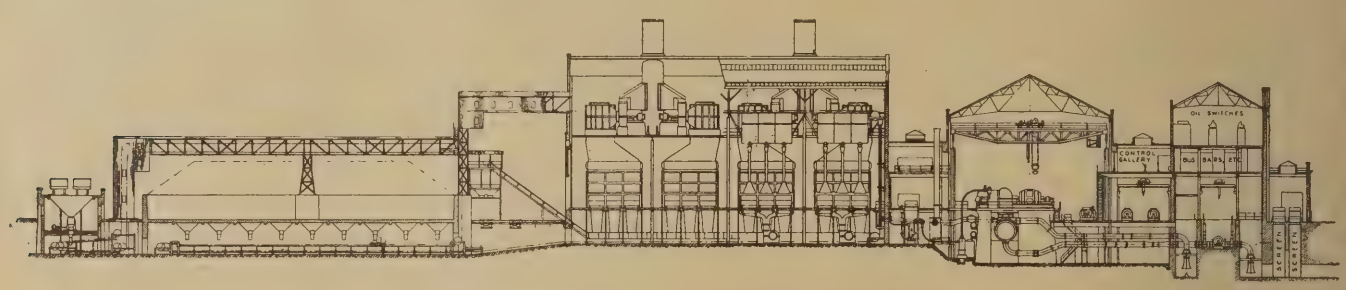

Fig. 16.—North Wilford Power Station: Sectional Elevation.

The roof of the oil-switch house is of fireproof construction. The other roofs are boarded and slated. Steel window frames are used throughout.

The interior of the turbine room is lined with glazed brick, up to a level of about 10 ft. above the floor line. Above the glazed brick lining, the walls have been treated with "Walpamur."

Foreseeing the rapid growth of the demand which will certainly arise, the Corporation has already authorised an extension of the station, by the addition of one 20,000-kW turbo-alternator, &c. This extension has been approved by the East Midlands Electricity Board, and confirmed by the Electricity Commissioners. The preliminary work is in hand, and installation will proceed immediately.

The transmission system has been laid and the sub-stations have been designed and equipped by Mr. H. Talbot, M.I.E.E., city electrical engineer. Energy is transmitted from the North Wilford power station at 11,000 V by underground cables to the Talbot Street and St. Ann's Well Road stations (to be used in the future as sub-stations) and to new sub-stations. Ten 0.2-sq. in., 3-core feeder cables have been laid from the power station to sub-stations at Wilford, Ruddington, Loughborough Road, Edwalton, The Park, Pierrepont Road, Holme Pierrepont, Radcliffe, Colwick, Carlton, City Asylum, Woodthorpe, Arnold, Radford, the University, Bullwell and Hucknall. A large proportion of the centre of the city is supplied with direct current, rotary converters being used for this purpose. Special

coupling transformers are erected at Talbot Street and St. Ann's Well Road to connect the 11,000-V supply from North Wilford to the 6,600-V system which had previously been supplied from the alternating-current plant at St. Ann's Well Road and the temporary power station. The whole of the outer portion of the area is and will be supplied with low-pressure, 3-phase, alternating current from a number of local sub-stations. Those which were originally fed at 6,600 volts will continue to be so fed, *via* Talbot Street and St. Ann's Well Road. Future sub-stations will be fed from North Wilford at 11,000 volts. While the North Wilford power station has been erected primarily for supplying

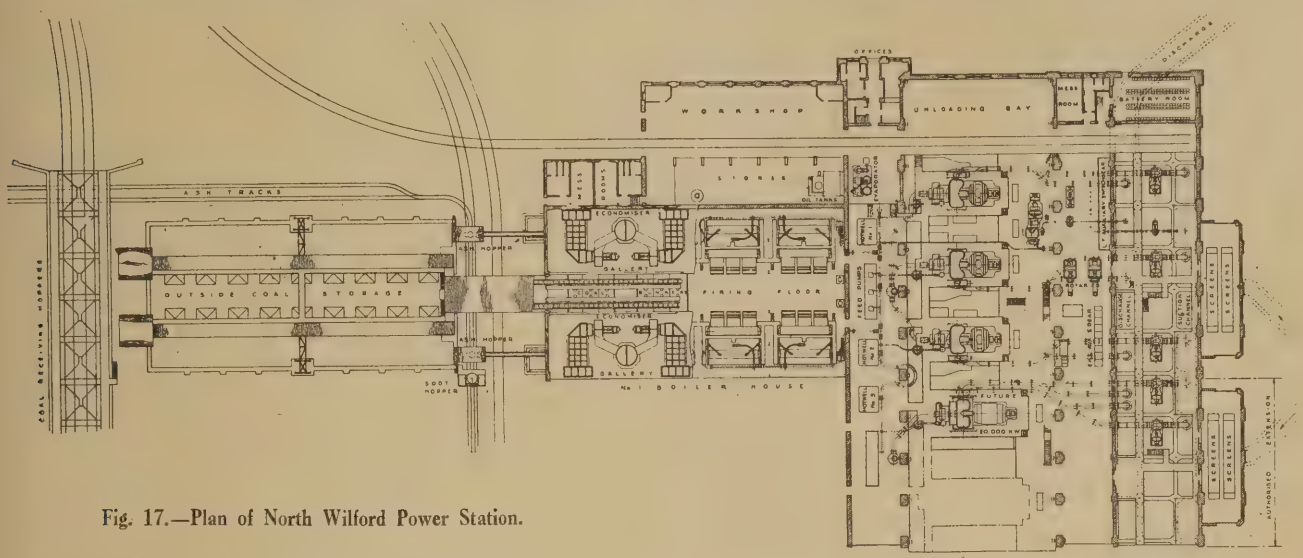

Fig. 17.—Plan of North Wilford Power Station.

the distribution area of the Nottingham Corporation, it has been designed so that it may be extended to deal with a working load of 200,000 kW should the necessity arise. The natural features of the site are such that the highest economy in generation will be possible, while its position, almost at the geographical centre of the East Midlands Electricity District, marks it as being the future source of the supply for that district, when the economical and physical limits of the existing power stations have been reached. Fig. 18 is a map of the area; the circles described about the station are of 5 miles increasing radii. The total area of supply is about 47 square miles.

The following is a brief *résumé* of the circumstances leading up to the erection of the new power station :—

The Corporation had been aware for a long time that its existing generating plant was out of date and uneconomical, and that the Talbot Street and St. Ann's Well Road sites were unsuitable for modern requirements. The question of the early provision of an up-to-date station was being fully considered in 1914, but the advent of the Great War effectively postponed for the time being all possibility of the provision of further generating facilities.

In 1918, upon the issue of the report of the Coal Conservation Committee of the Ministry of Reconstruction and the report of the Board of Trade Committee on Electricity Supply, the local authorities of Burton-on-Trent, Derby, Ilkeston, Leicester, Long Eaton, Loughborough, Mansfield, Newark, and Nottingham, on the invitation of the then chairman of the Electricity Committee of Nottingham (Mr. Councillor Swain) met in conference, and as a result of that meeting associated themselves together to consider the whole question.

Proposals were formulated for the reorganisation of electricity supply in the district, and in July, 1920, the Commissioners held a local inquiry at which the question was exhaustively considered, evidence being given by Mr. Alderman Huntsman and Mr. Rider. In due course the Commissioners granted the application, formal sanction to the construction of the new station being given on September 17th. Instructions were at once given to Messrs. Preece, Cardew & Rider to complete the plans for the first section of the station, the city engineer (Mr. T. Wallis Gordon) was instructed to prepare plans for the foundations and the buildings, and a site of 80 acres was purchased. The foundation stone of the new buildings was laid by Mr. Alderman Huntsman on June 14th, 1923. Progress was hampered in the early stages by the serious shortage of labour and building materials. To meet the growing demands in the city, two 2,000-kW turbo-alternators and two water-tube boilers were erected in the temporary building at North Wilford already mentioned.

The following are some of the contractors for the plant at North Wilford :—Messrs. Pritchett & Gold and E.P.S. Co., Ltd., accumulators; Underfeed Stoker Co., Ltd., ash conveyors and stokers; Stirling Boiler Co., Ltd., boilers; Davidson & Co., Ltd., fans; W. H. Allen, Sons & Co., Ltd., centrifugal pumps; W. J. Jenkins & Co., Ltd., coal conveyors; Stothert & Pitt, Ltd., crane (75 tons); S. H. Heywood & Co., Ltd., crane (25 tons); Babcock & Wilcox, Ltd., economisers and chimneys; G. & J. Weir, Ltd., feed pumps; British Vacuum Cleaner Co., Ltd., flue dust plant; Sheepbridge Coal & Iron Co., Ltd., pipework; P. & B. Evaporators, Ltd., evaporator; F. W. Brackett & Co., Ltd., screens; Foster Bros., Ltd., steel pipes; British Thomson-Houston Co., Ltd., rotaries, switchgear,

turbo-alternators, &c.; Callender's Cable & Construction Co., Ltd., cables; Brush Electrical Engineering Co., Ltd., transformers; Worthington-Simpson, Ltd., condensing plant and air pumps.

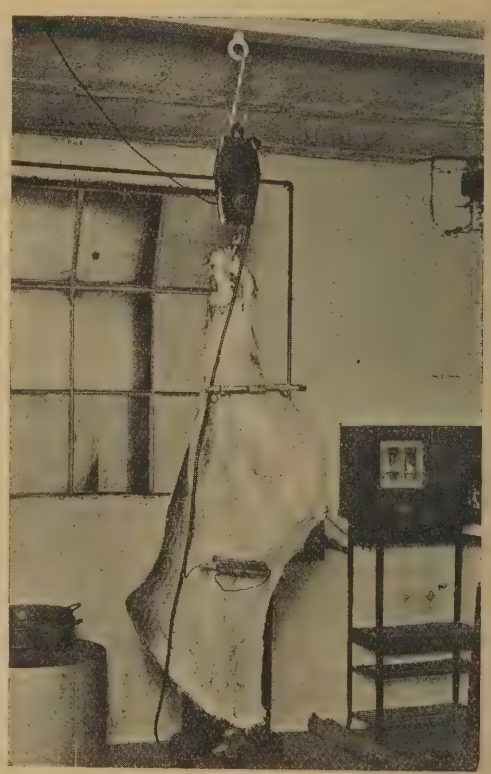
The photographs reproduced in this article are by Messrs. Henson & Co., of Nottingham. For most of the information we are indebted to a souvenir issued last week.

Defrosting Frozen Meat with Electricity.

A New Process of Australian Origin.

We were recently favoured with an opportunity of inspecting a process which is likely to be of considerable importance to the public generally, as well as to the electrical industry—the "defrosting" of frozen carcasses by electricity. The process is the invention of Mr. A. U. Alcock, M.I.E.E., managing director of Messrs. Herbert del Cotte Proprietary, Ltd., electrical engineers, of Melbourne, Australia, and was demonstrated to us at the offices of Messrs. Heatley & Co., London. A short note apeared in our issue of September 11th.

For the information of readers who are not familiar with the trade in imported meat, we may premise that the bulk of our supplies of beef are derived from the Argentine, as "chilled" meat, which is never actually frozen, and has to be distributed and retailed immediately on arrival in this country; it cannot be put into cold storage without serious deterioration. Carcasses imported from Australia, however, have to be frozen in order to enable them to withstand the long voyage; in this condition they remain sound and wholesome indefinitely, and can be kept in cold storage at the home ports for any length of time without undergoing change, so that they need not be distributed until the market is ready for their reception—a great advantage as compared with the conditions controlling the chilled-meat trade. Moreover, they can be stored on the premises of wholesale and retail dealers who are provided with cold rooms.



But hitherto frozen carcasses have been subject to the drawback that they could only be thawed by exposure to air at the atmospheric temperature, a process occupying three or four days in summer and a longer time in winter, during this time, as the whole of the heat must necessarily penetrate the carcass from the outside, through the external layer of fat, the outer portions thaw first and suffer deterioration through the prolonged hanging, and loss is incurred from this cause. Further damage results from the fact that the meat juices drain away from the outer portions whilst the inner parts are being defrosted, rendering the meat pale, dry, and unpalatable. Consequently, beef which has been frozen commands a lower price than chilled beef, though the smaller frozen carcasses of lamb and mutton, which obviously thaw much more quickly, have a high reputation and are imported from Australia and New Zealand in enormous quantities.

Mr. Alcock conceived the idea that the process of "defrosting" could be greatly accelerated by the use of electric heating applied to the interior of the carcass, and after long investigation—for the matter proved less simple than it might appear—he has devised a system which, it is claimed, restores frozen meat to its natural condition quickly and without the disadvantages of the atmospheric method of thawing. His process consists of passing an alternating current through the substance of the meat, thus heating it from the interior. By the use of a.c., electrolytic action is avoided; and as the interior of the carcass is thawed first, it is protected from deterioration by the colder surrounding layers. Dripping of the juices is practically negligible, owing both to the sealing action of the frozen surface and to the shortness of the time during which the meat is being defrosted.

The apparatus required for the purpose is very simple. It comprises a small transformer and a set of electrodes, with the necessary connecting leads. The transformer case is provided with large hooks, one of which attaches it to the ceiling, while the other supports the carcass—a matter not merely of convenience, but also ensuring that the connections will naturally fall in the right positions. As the power consumed never exceeds 150 watts, the transformer primary leads can be connected to an ordinary lampholder with an adapter. The secondary leads, of cab-tire-sheathed cable, are suspended from the transformer, and are provided with plug connections well covered with insulating material. Three electrodes are employed: one for the hind leg (the uppermost portion), consisting of three six-pronged forks, which are held in a fibre frame; one for the middle, comprising two similar forks; and one for the thin end of the carcass, consisting of a single fork. These electrodes are driven into the frozen meat with a mallet, at intervals measured with a templet, and are made alive by the plug connections, which are suitably spaced apart on the cable. The triple-fork electrode is attached to one pole of the transformer, and the other two to corresponding connections of the special winding. The prongs are of stainless steel, which neither tarnishes in use nor imparts any taste to the meat.

The current flowing from the middle double-fork electrode to the triple-fork, traverses a solid mass of flesh of about the same length as, but more than double the cross-section of, the remainder of the carcass; whilst the current flowing from the single-fork electrode, traversing the whole length of the carcass, meets with a much higher resistance. Consequently, with the same applied potential difference, a much larger current flows through the solid flesh than through the thinner rib portion of the carcass—thus ensuring that all parts will be defrosted in about the same time.

As the thawing proceeds, the resistance of the circuit diminishes, so that the current tends to increase; for this reason the transformer is specially designed so as to be self-regulating; the process is therefore entirely

Defrosting a Hind-quarter of Beef.

automatic. All that the butcher has to do is to insert and couple up the electrodes, and to remove them when the operation is completed. The electrodes are carefully proportioned so that, on the one hand, there is no local heating, and on the other, the meat is not marked or disfigured in any way that would affect its selling value. The maximum voltage employed is 200 V, and the maximum current is 1.5 A; the total consumption of energy for defrosting a hind-quarter of beef is less than 3 kWh, costing 6d. at 2d. a kWh. The value of the meat defrosted would be from 80s. to 90s., so that the cost of the energy is trifling in comparison with the value

of the meat—much less than the loss that results from the scrapping of rancid fat when carcasses are thawed by exposure to the air. An incidental advantage of the process is that, whereas defrosting by air involves the hanging of carcasses three or four days before they can be cut up and sold, the electrical method involves only one day's hanging; consequently a dealer need only provide about one-third the space and invest one-third the capital hitherto required for frozen meat. But a much more important consideration is the fact that beef defrosted electrically has a far higher market value than frozen meat thawed by air. Thus, the great obstacle to the importation of Australian beef on a large scale is removed, and a further stimulus is given to trade within the Empire.

According to *Whitaker's Almanac* for 1925, Argentina sent us 9,105,651 cwt. of beef in 1923, whilst from Australia we received only 712,127 cwt., a ratio of 13 to 1, whilst the values were in a higher ratio—15 to 1. In the case of mutton, however, New Zealand and Australia furnished 1,464,704 cwt. against Argentina's 1,076,296 cwt. Evidently there is immense scope for increase in the trade in frozen (Australian) beef. The electrical defrosting of the present comparatively small imports of frozen beef alone would represent a revenue of nearly a quarter of a million sterling per annum to the electricity supply industry.

The process and appliances have been patented, and arrangements are being made to hire out the apparatus to users.

Hydro-Electric Possibilities in South America.

Opportunities in Brazil and Bolivia.

(By our Special Correspondent.)

Probably no other State in the world has greater undeveloped hydro-electric potential water power awaiting exploitation than Brazil, nor is there any that has made less progress in this direction. Experts who have examined the many waterfalls and rivers of South America that can be adapted to the generation of energy are agreed that the possible development in Brazil approaches something like 50,000,000 h.p., yet of this total little more than 9,000,000 h.p. is at present harnessed. Successive governments have naturally been desirous of seeing power and light more generally used—especially for industrial purposes—throughout the Union; but, unfortunately, funds with which to foster the enterprise have always been lacking. Brazilians have been as reluctant to subscribe to the hydro-electric undertakings as they have been to finance transport, such as railways and steamships. With some exceptions, these have been left in the hands of foreigners, mainly British (that is to say, Canadian), and the fine services of electric light, power and traction now offered in Brazil are the results of foreign enterprise owing little or nothing to native support.

Where electrical energy has been introduced as a substitute for steam power, it has been found that the saving has amounted to as much as 50 per cent., and in some casee even to more. It is clear that there exists an enormous development for industrial activity in direct relation to the natural resources of the country, facilitated by the provision of cheap hydro-electric power. Among many different enterprises in Brazil, supported, as hitherto, by the contributions of foreign capital, may be mentioned a project known as Mar Energo, the promoters of which will endeavour to utilise tidal energy. A moderate preliminary capital, consisting of 1,150 milreis, has been subscribed, and a patent has been taken out for a "hydro-motor." It is considered doubtful, however, whether the undertaking will make very much progress.

Lack of funds has again interfered with the carrying-on of the long-delayed Brazil Central Railway electrification scheme. As far back as 1922, a loan of $25,000,000 was raised in the United States clearly labelled "Central Railway Electrification Loan." But instead of expending the money obtained upon the prosecution of this enterprise the Government of the day, with the consent of the President, Dr. Epatacio Pessoa (who afterwards attempted to excuse the action), expended the greater part of the proceeds upon improving the Federal Railways. No further capital from abroad was then obtainable, and by the end of 1923 little or nothing had been done towards carrying out the electrification of the Central Railway. During the past year or so some appreciable progress has been made, not sufficient, however, to enable the management to institute a scale of working economies such as were expected and promised. Now, another halt in construction has ensued, and before further work can proceed a credit of at least 1,500 contos of reis will be needed. A large sum on account has been asked for to carry out urgent repairs, but the Brazilian Congress has not as yet voted the payment.

A commencement has been made upon the electrification of a part of the Oëste-Minas Railway, the contract being in the hands of the Metropolitan-Vickers Electrical Co., Ltd. The portion of the line referred to is between Barra Mansa and Augusta Pestana, a length of about 71 km.

When the existing contract with the Sao Paulo Railway Co., a British-owned concern, terminates two years hence, it is proposed to build a competitive and parallel line, wholly worked by electricity, to provide facilities at the port of Santos. For this purpose an enormous capital would be required, and although it is expected that the Brazilian Government will promise a large contribution, the entire sum cannot be derived from that source. The Minister of Public Works, Dr. Francisco Sá, is doing his best to raise capital, but at the time of writing his progress seems to have been very slow. The best way out of the difficulties with which transport in this—the most important—commercial centre is confronted, will be for the Brazilian Government to renew its contract with the British company, which, on its part, has expressed its willingness to build a parallel line to its own and then work the two in conjunction. But for the local hostility and jealousy displayed, this scheme would undoubtedly have recommended itself to the Government, Federal as well as State. Political, rather than economic, reasons have hitherto prevailed, and the Administration has not seen its way to accept the offer.

But for the new political upheaval in Bolivia that has recently taken place, and promised to be one of a series of similar presidential election disturbances, foreign capital would have been forthcoming for one or other of the various schemes put forward for the utilisation of the hitherto untouched available water power for the production of electricity on the eastern slopes of the Andes. Congress has had this matter under discussion upon various occasions over a number of years, and it was hoped that certain developments would have been decided upon this year. The Senate has likewise manifested its interest in the proposal by instituting—and eventually accepting—Governmental surveys.

Another Bolivian project suggested, but one which is considered wholly impracticable, is in connection with the utilisation of the waters of Lake Titicáca. It is reported that German engineers have asked for a concession to utilise this lake, the area of which is estimated at 5,000 square miles, standing at an altitude of 12,800 ft. The catchment area apparently is enormous, but the rainy season lasts only for three months of the year, and the extent of evaporation is very large. Between the wet and dry seasons the maximum difference of water level is about three feet. The natural discharge is through the Desaguavero, a sluggish river which remains nearly dry during six months of the year, and eventually loses itself in the Bolivian plateau located about 500 km. south. The only method by which the waters of Lake Titicáca could be utilised for the provision of electric power would be to construct a tunnel 100 km. in length, but when the cost of such an enterprise is considered, the proposition appears wholly impracticable.

Legal.

St. Helens Corporation Summoned.

THE St. Helens Corporation was summoned at the local court on September 14th, by two residents, Messrs. V. Hanratty and W. Leather, for a breach of its Electric Lighting Order. It was stated that Mr. Leather applied to the Corporation on July 13th for a supply of electricity, having had his house wired. The Corporation, however, although written to twice, had not connected up with the main or supplied a meter, on which a deposit of £2 had been paid.

Mr. DAVIES, for this plaintiff, said that the trouble appeared to be that the house had been wired by plumbers who were not members of the E.T.U., and the E.T.U. jointers employed by the Corporation therefore refused to connect the house to the mains. He directed attention to the decision given on November 14th last, when a fine was imposed on the Hackney Borough Council, which pleaded *force majeure* in a case in which that Council's electricians threatened to cease work if a house wired by non-union labour was connected up.

Plaintiff said that the difficulty between the Corporation and its workmen had nothing to do with him.

Mr. GOLDIE, for the Corporation, said that the permission which had been given for plumbers to wire up houses had been withdrawn because of the unemployment amongst the electrical workers. He read a letter from the district secretary of the E.T.U. stating that if the Corporation connected up plaintiff's house, the 40 E.T.U. members employed by the Corporation would strike and would receive the support of 150 other E.T.U. men. The whole of the public supplies of electricity would then be stopped.

The Corporation pleaded that the decision in the Hackney case did not apply to the one in dispute. The Electricity Committee had tried to overcome the difficulty which had resulted in those proceedings, by getting a workman from Liverpool to do the work, but objections were raised.

The magistrates, in giving a decision against the Corporation, imposed a penalty of 1s. per day.

Notice of appeal was given.

Reviews.

Ether and Reality. By SIR OLIVER LODGE, F.R.S. Pp. 179. London: Hodder & Stoughton, Ltd. Price 3s. 6d. net.

Sir Oliver Lodge is now an old man full of years and honours. His distinguished career in science extends over the whole period within the memory of most men now living and, as may be gathered from the title-page of the book before us, almost every scientific society of note has been proud to receive him. A doctrine therefore in which he firmly believes, and to which he has been constantly faithful, is a doctrine which must be treated with respect.

The doctrine which Sir Oliver Lodge proclaims is the reality of the ether of space. He thinks it is the fundamental substance of the material world, and the connecting link which unites it with the spiritual world. Now the difficulty about believing in the reality of the ether is that we have to ascribe to it properties of fluids and properties of solids which are mutually exclusive. It must be lighter and vastly more fluid than any gas, in order not to retard our motion round the sun or deprive the earth of its atmosphere by friction; on the other hand, it must behave like a solid vastly more rigid and dense than any metal, in order to transmit the radiation of light. These are examples of the contradictory properties with which it is necessary to endow the ether, in order that it may fulfil the functions ascribed to it by the interpretation of phenomena. These contradictions strain belief—even the belief of scientific men, which of late has been assuming the elasticity at one time peculiar to that of theologians. As Prof. Lodge says:—"We used to try to explain the properties of the ether in terms of matter. Lord Kelvin made a life-long effort in that direction, and at the end of his life he had to announce failure. The failure was due to no defect of his; such an explanation is impossible. Ether is not to be explained in terms of matter."

At this point it would occur to most people to conclude that the time has, therefore, now come to abandon the ether; but this is not the conclusion reached by Prof. Lodge. He goes on: "We have learnt that the problem lies in the opposite direction; and modern physics, since Lord Kelvin's time, may be said to be devoting itself to the explanation of matter in terms of ether."

One is, somewhat inconsequentially, reminded of Mahomet, who, when the mountain would not come to him, decided that it would be the same thing if he went to the mountain. And the mountain is, in this case, a mountain shrouded in mists, for this ether by which the whole universe is to be made comprehensible, is itself past understanding.

However, those who would like to see the case for the ether well put, ably put, better put, some would say, than the case deserves, cannot do better than peruse this book, as they may do with no great pains to themselves; because it is well written in the easy style of one who is a past master in the use of the expository pen. They will be interested to learn that he makes the density of ether, compared with water, to be "one followed by twelve o's—or of that order of magnitude." From which it may be inferred that if we compared its density with that of steel, eleven o's after the 1 might suffice to represent it. Truly we need faith that will move mountains.

The China Year Book, 1925-6. Edited by H. G. W. WOODHEAD, C.B.E. Pp. 1,349. Tientsin: The Tientsin Press, Ltd. London agents: Simpkin, Marshall, Hamilton, Kent and Co., Ltd. Price 42s. net.

The many phases of China and Chinese life with which this large volume deals make it of interest to almost anybody into whose hands it may come. Geography, geology, natural history, mineralogy, trade, and history are only a few of the subjects which are dealt with in a masterly way either by the Editor himself (who is also the editor of the *Peking and Tientsin Times*) or able collaborators. Interesting as the matter is, we must reluctantly confine our attention to the electrical and trade sections in this short review. Among many other matters in the part dealing with engineering is a list of electricity undertakings arranged by provinces alphabetically. This shows that there are few Chinese towns of any size which are unprovided for in this respect. There are about 230 undertakings in the list, most of them of very small capacities; in fact, only about 20 (including the Shanghai undertakings) have plant of more than 1,000 kW. The particulars given in each case are the name of the operating company or other authority, the capital employed, and the capacity of the station. Brief mention is made of the fact that tramways are operated in a number of the principal cities, including Dairen, Hong-Kong, Shanghai, Tientsin, and Peking.

A brief history of the Chinese telegraph system appears in another part of the work and details are given of the conventions which exist between the Chinese Government and the cable companies and other countries. This is followed by some statistics relating to the service, *e.g.*, it is stated that the length of land lines is 55,331 miles, the length of wires 78,852 miles, and that 5,197,596 "domestic" telegrams were transmitted in 1919. It will be judged from the last statement that the figures are not very recent ones, but there are good reasons for this, as all who have read the newspapers during the last two or three years are aware. The information upon radio-telegraphy is more up-to-date, and a list of stations is given showing the type of equipment, the power employed, the controlling authority, &c. Forty-five stations are listed.

The section dealing with Chinese commerce is particularly interesting, as it traces China's trade with the outside world from the earliest records (B.C. 1122) to the present day. A separate note is devoted to England's trade with China, dating from the sixteenth century since when this country has held the principal position in China's foreign dealings. The existing commercial treaties are reviewed, and the section closes with a chapter on trade during 1923-24. This shows that the value of imports during that year was very little below the record level reached in 1922, while the exports were practically on the 1913 plane in actual values.

The year book contains a great deal of matter relative to the political and military situation which should prove of service to the general reader to whom the average newspaper report is very obscure.

Electrical Machinery Erection. By TERRELL CROFT. Pp. ix+314; 334 illustrations and drawings. London: The McGraw-Hill Publishing Co., Ltd. Price 15s. net.

There are many problems which are met with when transporting and erecting any kind of heavy machinery, but electrical machinery presents many peculiar problems of its own. For example, a lathe is always erected on the floor of the workshop, but the electric motor driving the line shaft may be bolted to the girders of the floor above, to the columns supporting the roof, or, indeed, in any convenient position which may be available. Thus, while in the book under review the author discusses many problems which might arise in any

engineering works, a number of them are peculiar to the electrical industry. It is to be noted, however, that the title which he has chosen does not do justice to the ground which he has covered, as in addition to the problems of erection he discusses the question of transporting machinery from the manufacturer to the user, while he also includes a useful section on the maintenance and upkeep of electrical machinery.

The work is divided into five sections and although the questions discussed in certain of these are somewhat similar to those met with in other sections of the book, the division seems to be an eminently wise one. The first, which is called "Unloading and Moving Electrical Machinery," deals with the problems of transferring a machine from the test bed to railway truck or wagon, and thence transferring it to a wharf for shipment or depositing it in the works of the user. The question of slinging is discussed, including the problem of strutting, &c., to prevent the bedplates bending under their own weight, and the protection of windings during slinging. Useful tables are included, giving the strength of slings and approximate figures for the cost of handling machinery are also given. The book, it should be noted, is of American origin, so that the costs which are given in dollars can only be considered in a comparative sense. The next section is entitled "Supporting Electrical Machinery," and in it will be found details of a number of useful forms of brackets and girder arrangements for securing motors on walls, ceilings, columns and beams, or on the framework of machine tools, &c. Tables giving the strengths of beams and girders of different sections and spans are included in this section. The third section, which is called "Erecting Electrical Machinery," deals more particularly with the construction of temporary supports and staging for transferring heavy machinery from the crates or wagons to its final foundations. There are certain parts in this section which are similar to those in Section I, but it contains much information of a useful character, while the question of shrinking on flywheels, &c., is of value because it is seldom met with in text books. It may be mentioned that the problems of erecting generators, motors, and heavy transformers are all considered in this section. In the fourth section, the machine being on its foundation the final work of alignment and securing to the foundations is considered, the problems discussed ranging from small motors with pulleys to be correctly set relative to the pulleys on a countershaft, to the alignment of a large turbo-alternator. The final section, which is, perhaps, rather out of place in a book of this kind, deals with the maintenance of electrical machinery, such problems as re-mettling bearings, care of roller and ball bearings, the removal of dust from windings and commutators being discussed. The importance of routine inspection is mentioned and useful maintenance charts are given.

The author is to be congratulated upon having put into book form a great many useful facts and some valuable data dealing with a phase of engineering practice which, despite its importance, has not received the attention it deserves. The book is very carefully illustrated, a feature being the perspective line drawings which convey at a glance the author's meaning. A very complete index is appended which greatly facilitates reference to any particular problem, while for the earnest student of the book a number of questions are given at the end of each section which cover thoroughly the subject matter of that section. Altogether it is a book which we can thoroughly recommend to every engineer who has to deal with the transport or erection of electrical machinery.

The Elements of Machine Design. By S. J. Berard and E. O. Waters. Pp. x+323; figs. 244. London: Blackie and Son, Ltd. Price 10s. net.

There are certain branches of knowledge which cannot be taught, they can only be slowly acquired in the hard school of experience. We are inclined to think that machine design must be regarded as coming in this category. Not that it is impossible to prepare a young engineer to become a draughtsman and a designer, but no matter how complete that preparation may have been, it will generally be conceded that such a person could hardly be qualified to prepare the designs for, say, a 25-h.p. motor which could be manufactured on a competitive basis with the designs prepared by a man who has had years of experience in this particular branch of engineering work. It seems to us, therefore, that the authors of this very excellent book have rather misjudged its purpose when they suggest that it should fill a gap between engineering drawing and advanced machine design, although they are on less debatable ground when they express the hope that it will serve as a guide for students in technical schools and for young draughtsmen. For this purpose it is certainly one of the best books we have seen for many years, and the young engineer who has thoroughly grasped the various principles explained in the course of its 323 pages should be able to solve in the most satisfactory manner those practical problems with which he will be faced as soon as he commences the most simple design work in a commercial drawing office. It may be questioned as to how far it is possible in a text-book to lay down the fundamental economic principles governing the production of any work on a commercial basis, but certainly in this book no attempt is made to attack this vitally important side of the problem at all, and to that extent it must be deemed to fall short of fulfilling the requirements of advanced design. With this reservation, however, we may at once assert that the authors have produced a book which is particularly well suited to guide the student or the young engineer who is desirous of becoming a designer.

It will be admitted that a knowledge of the materials used in engineering construction is of great importance to the designer, and hence the authors rightly give prominence to this part of the subject in their opening chapters, and not only do they deal with the simple ideas of stress due to direct loads, bending and torsion, but a brief outline of the method of production of the various constructional materials is also given, including such processes as tempering, case hardening, and the production of malleable-iron castings. We note here, however, that while combined bending and torsion is dealt with, the strength of material subjected to combined compression and bending, *i.e.*, the familiar strut as represented by the connecting rod of an engine, has been overlooked. After these preparatory chapters, the design of various fastenings is considered, the problems of rivets, bolts and nuts, keys and cotters being dealt with in accordance with the principles of the strength of materials enunciated in the earlier part of the book. This is followed by a number of chapters on what is sometimes known as millwrights' work, *viz.*, shafts, bearings, pulleys, belting, &c., after which four admirable chapterms on gearing are given. In these four chapters toothed gears of all kinds are dealt with, including worm gears and an excellent design of enclosed worm gear suitable for a low-speed drive from an electric motor is worked out. The book concludes with a treatment of the various reciprocating steam engine details, including pipes and valves. A brief survey of the elementary problems of structural design using rolled sections is also given.

Thus, within a comparatively small compass the authors have succeeded in covering the whole of the syllabus usually set for examinations in this important subject. They have also included a number of tables for standard dimensions of various fittings, and numerical examples illustrating the various problems in design are also given. The book, we ought to mention, is of American origin, and some of the standards included, as well as some of the symbols employed, are different from those used in British practice, but the work hardly suffers on that account, as the tables of standards are available in the majority of engineering pocket books, and these can be very easily obtained. A word of praise must be given to the producers of the book. The drawings are extremely well done, being clear and of large scale, no attempt having been made to include too much within the compass of a page of a text-book as is so frequently the case in books of this kind. Moreover, where necessary the ordinary orthographic views are assisted by carefully-drawn perspective views as well as half-tone photographs, so that little or no difficulty should be experienced in understanding the exact shape of any machine detail under consideration. The whole book has been printed on smooth-surface art paper, which adds greatly to the clearness of both text and drawings, and at the price given above the book must be regarded as an exceptionally good production. We can recommend it to the young draughtsman and to the technical student with the utmost confidence.

The Theory of Electric Cables and Networks. Third edition. By Alexander Russell, M.A., &c. Pp. xii+356; figs. 88. London: Constable & Co., Ltd. Price 24s. net.

As in the previous editions, the work commences with a *résumé* of the fundamental principles pertaining to the design of networks and the distribution of electrical energy, and deals with the highly theoretical considerations of dielectric strengths and stresses. Although the book is, in the main, a theoretical treatise, it is written throughout with a view towards the conditions met with in practice. Much practical information, for instance, is given in the chapters on distributing networks and faults in networks. The chief addition to this edition is in the appendix, where the question of how far the position of the power station site is affected by the cost of the copper for the requisite feeder mains is discussed.

The Small Cost of Power.—Power salesmen are often confronted with the statement by a prospective customer that the power rate is too high. An effective answer to this objection has been found by many salesmen in the statement that the cost of power is a very small percentage of the total manufacturing cost, whereas the many desirable and valuable features of purchased power make its use an important advantage to a manufacturer. The relation of power costs to the total manufacturing cost in specific industries is frequently helpful in convincing a prospective power user. A recent study of power cost and its relation to total manufacturing costs of twenty-one industrial power users showed that, with very few exceptions, the cost of power was less than 3 per cent. of the average manufacturer's production expenses.—*Electrical World.*

Hydro-Electric Development in the United States.—A recent report of the United States Geological Survey states that at March last the total capacity of hydro-electric plant installed in the United States was 10,038,000 h.p. This figure includes only machines of 100 h.p. or more. The greatest development is in the State of New York (1,713,550 h.p.), while the next in order are California 1,531,480 h.p., Washington 560,693 h.p., North Carolina 534,600 h.p., and Maine 476,627 h.p. It is estimated that the undeveloped power in these states will permit of the installation of the following amount of plant:—New York 4,734,000 h.p., California 7,145,000 h.p., Washington 9,672,000 h.p., North Carolina 526,000 h.p., and Maine 920,000 h.p.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Employment in the Engineering Industry.—The September *Ministry of Labour Gazette* states that employment in the engineering industry during August remained bad on the whole and showed a further slight decline. Conditions in the electrical engineering branch remained fairly good. While the proportion of unemployed in the industry as a whole was 11.8 per cent., the proportion for the electrical engineering branch was only 5.9 per cent., a decrease of 0.1 per cent. as compared with the July figure. In the electrical wiring and contracting industry there was a decrease of 0.8 per cent. in the number of unemployed, and there was a fall of 0.3 per cent. in the electrical cable, wire and electric lamp manufacturing group.

Threatened Tramway Strike at Salford.—A dispute arose last week in the Salford Corporation Tramway Department owing to the employment of four non-unionists. Strike notices, due to expire on September 20th, were served. Three of the men who were the cause of the dispute agreed to join the Transport and General Workers' Union, while the fourth man, who refused to join the union, went on holiday and the strike notices were suspended until his return.

For Sale.—Messrs. Knight, Frank & Rutley will sell by auction, on September 29th and following days, at the Alpine Club Hall, 23, Savile Row, W., a quantity of new electric lighting fittings, &c. Dundee Corporation Electricity Supply Department has for disposal two 2,000-kW Willans-Parsons steam turbines coupled to Dick Kerr 3-phase alternators, complete with condensers, air pumps, &c. Mr. H. J. Shaw will sell by auction on September 29th at 13, High Holborn, W.C., the stock of an electrical and wireless goods factor. The Burgh of Oban electricity department has for disposal steam generating plant. The Chief Engineer, H.M. Office of Works, invites offers for the whole of the plant and equipment of H.M. power station, Beachley, near Chepstow. Preston Corporation electricity department invites offers for surplus turbo-generators, boilers, &c. (See our advertisement pages to-day.)

The Radio Industry: The Question of Protection.—It is reported by several daily papers that application is being made to the Board of Trade for the safeguarding of the British radio industry. According to statements attributed to Mr. Guy Burney, whose retirement has lasted for quite as long a period as those who know him would have anticipated, the brief of the trade (he is chairman of the National Association of Radio Manufacturers and Traders' Committee) is now completed. He states that for the year ended December 31st last radio manufactures to the value of not less than £850,000 came into this country. Germany, Austria, and France (and America, in a lesser degree) were the chief invaders of the British market, and so far their competition had been most harmful in the matter of headphones. Not less than 2,000,000 pairs of these were sent into the British market last year, at prices approximately 50 per cent. below the price at which we can afford to market them in this country. Dealers declare that they can sell ten foreign headphones to one British because the low prices appeal to the small constructor.

Lead. — Reporting on September 19th, Messrs. James Forster & Co. stated:—"There are reports of lessened consumption on the Continent, due to the high price of the metal and credit difficulties, particularly in Germany. Here consumers have not been much in evidence this week, but consumption is on a very heavy scale, and consumers, as a rule, are not well bought forward. The Board of Trade returns for August are:—Imports, 23,414 tons; exports, 2,161 tons; leaving for home absorption 21,253 tons. The total of the last for the eight months to the end of August is 162,627 tons."

A Wireless Exhibition Criticism.—The Wireless Retailers' Association recently addressed a communication to the National Association of Radio Manufacturers and Traders protesting against a particular retail firm being permitted to announce in the Albert Hall Exhibition catalogue that wireless sets and components were available for immediate purchase and delivery at their stand, and to further state that the productions of any of the exhibitors on the ground floor could be supplied for immediate delivery to the public. Exhibitions of this character, said the W.R.A., were organised by the trade to enable trade buyers to inspect exhibits and to place orders, and to afford the public opportunities to inspect manufacturers' products, the names of intending purchasers of these being passed on for handling through retail channels.

The British Industries Fair.—We have received from the general manager of the Birmingham section of the British Industries Fair an advance prospectus of the 1926 display. This will be held at the Castle Bromwich Aerodrome from February 15th to 26th. At the head of the prospectus is a statement that the Government has agreed to spend a sum of money not exceeding £25,000 for the purpose of publicity for the Fair at home and abroad. It is stated that the results of the last Fair were so satisfactory that many participants have already applied for increased stand accommodation, and it is worthy of note that the price of space has been reduced by a substantial amount (20 per cent). Special arrangements for low-priced small stands for firms that are unable to take much space have been made. The Birmingham Section is divided into eleven classes, *viz.*:—Brassfoundry, hardware and ironmongery; metals; construction, building and decoration; power, lighting, heating, cooking, and ventilating; engineering; agriculture; mining; motors, cycles, &c.; guns, saddlery, &c.; brewing, &c.; and "services." The list of members of the Council includes the names of Mr. G. P. Achurch (Parker, Winder & Achurch); Mr. J. Belliss (Belliss & Morcom, Ltd.); Mr. F. Forrest, M.I.E.E., and Dr. C. C. Garrard (General Electric Co., Ltd.). The Fair Management Committee includes Mr. R. A. Chattock, the city electrical engineer, and Mr. Alfred Baker, general manager of the Corporation tramways.

The Sale of Appliances by Supply Authorities.—The feeling expressed at this year's I.M.E.A. Congress that electricity supply authorities should have power to sell electrical appliances (and exercise it) has its counterpart in the United States. The National Electric Light Association is endeavouring to impress upon its supply company members the importance of undertaking the sale of electrical appliances. In a recent issue of the *Electrical World* the president of the N.E.L.A. stated: "Every power and light company should have an efficient sales organisation, an advertising department directed by someone who has made a study of advertising, and should obtain the advice and utilise the ability of a person who knows how to decorate and trim windows properly and forcibly."

Trade Announcements.—The telephone numbers of the "FERROWATT" ELECTRIC LAMP WORKS (GREAT BRITAIN), LTD., 72, Oxford Street, W.1, are "Museum 5053-4."

MR. E. T. KING, of Messrs. Bass & Co., 120, High Street, Rickmansworth, informs us that he has taken over the business at that address and is responsible for all debts.

MR. H. STANLEY SMITH, of the Silchester Electric Stores, 2, Silchester Road, Hastings, has taken larger premises at 45, London Road, Hastings.

MR. T. BRERETON, formerly with Carrington & Button, has commenced business with his son at Evleston Road, Crewe, as electric lighting specialists.

MR. L. J. WOLF has commenced business on his own account at 116, Putney Bridge Road, London, S.W.15, where he will act as sole distributor for the Robbins & Myers Co., of Springfield, Ohio, U.S.A. Mr. Wolf was until 3½ years ago managing director of the original Wilson-Wolf Engineering Co., Ltd., and subsequently he managed the small motor department of Messrs. Pooley & Austin.

The business of the ASTRO ELECTRIC, LTD., in its entirety has been purchased by the B.I. Syndicate, Ltd. It will be continued at the same address (45-48, Carlton House, Lower Regent Street, London, S.W.1). Mr. R. Rook-Jones continues as sales manager and practically all the old staff has been retained. A folder has been issued giving reduced prices of certain types of reflectors.

On October 1st the telephone numbers of the POWER EQUIPMENT CO., LTD., of Hendon, will be altered to: "Colindale 6196 and 6197."

Sales Development.—An all-day conference of members of the Incorporated Society of British Advertisers on the problem of increasing sales in the home and oversea markets is to be held at the Hotel Cecil on Thursday, October 29th, to be followed by a banquet in the evening. It has been arranged that on the second Wednesday evening in each month, commencing in November, there shall be a dinner at the Old Colony Club, Aldwych, followed by a business meeting.

Bankruptcy Proceedings.—WM. REGINALD GRIGSBY, dealer in electrical goods, &c., 184, Gray's Inn Road, W.C.—This debtor carried on business as the Wenham Lighting Corporation. He failed in June, 1925, with liabilities £2,577 against assets valued at £909, and on September 15th he attended for public examination before Mr. Registrar Hope at the London Bankruptcy Court. Questioned by Mr. Wheeler, Assistant Official Receiver, the debtor stated that in August, 1911, he purchased his father's business of gas lamp manufacturer and subsequently opened a branch for the sale of electrical goods and took up contracts for electric lighting. In 1924 he entered into a partnership with a Mrs. Clark in relation to a contract for electric lighting at the British Empire Exhibition, which involved him in a heavy loss. The debtor also attributed his failure to lack of capital, bad debts, and depreciation of stock. The examination was concluded.

T. W. CRAWFORD, merchant, 32, Victoria Street, S.W.1.—Under a receiving order made on August 31st upon the petition of a creditor, the first meeting of creditors was held on September 16th, Mr. Walter Boyle, Senior Official Receiver, presiding. According to the debtor's statements in preliminary examination, he started business in December, 1923, under the style of The Despina Company, at 41, Cheapside, dealing mainly in electric lamps. The British Thomson-Houston Company, Ltd., obtained an injunction against him in June, 1924, restraining him from infringing its patents, and as a result of that action he closed down the business, together with a branch

which he had opened in Liverpool. In the following September the debtor took offices at 32, Victoria Street, S.W., and there carried on a similar business in the name of T. Wheatley and Company, but in consequence of bad trade and the lack of financial support, he had to close the business last April. The failure was further attributed to illness and heavy overhead charges. No accounts were lodged but the chairman reported that the liabilities were roughly estimated at £700 and the assets were very small. The estate was left in the hands of the Official Receiver.

THOMAS BARTON, Electric Works, Ainsworth Street, Blackburn, electrical engineer.—The public examination of this debtor was held on September 16th at the County Court, Blackburn. The statement of affairs showed gross liabilities of £8,833, of which £3,813 was expected to rank, against assets of £5,793, leaving a surplus of £1,980. The Official Receiver said that debtor commenced business at Ainsworth Street in 1886 with £600 capital lent him by his wife. In June last he executed a deed of assignment for the benefit of his creditors, at which time the liabilities were shown at £3,686, while the assets were estimated at over £4,000. Questioned by the Official Receiver, debtor said that at first he did not consider he was solvent, but on reconsideration he was now quite satisfied that he was perfectly solvent. The examination was closed.

F. J. TIZZARD and N. TIZZARD, trading as Tizzard Bros., 27, Dalkeith Street, Barrow-in-Furness, and 121, Market Street, Dalton-in-Furness, electrical engineers and contractors.—The receiving order in this matter was made on the debtors' own petition. The first meeting of creditors was held on September 12th, at the Official Receiver's office, Barrow-in-Furness, when the case being a summary one was left with the Official Receiver as trustee. The following are creditors:—

	£		£
Chloride Electrical Storage Co., Ltd.	21	N.W.E., Ltd.	31
Marsoleus	71	Thornton, W. R., & Son, Ltd.	124

ARTHUR KITSON, 1, Central Hall Buildings, Westminster, electrical and mechanical engineer.—The adjourned first meeting of creditors was held on September 21st at the London Bankruptcy Court, before Mr. Wheeler, Official Receiver, when a resolution was passed appointing Mr. Thomas Langley Judd, 40, King William Street, E.C., trustee to administer the estate in bankruptcy. The debtor stated that he was not prepared to submit any offer to the creditors at present. He was now working on a scheme for the reorganisation of the Kitson Engineering Co. (London), Ltd., and if his efforts were successful he would be able to pay all his debts in full.

W. H. MURAD (W. H. Murad & Co.), wireless manufacturer, 126, Princess Street, Manchester.—Application for discharge to be heard October 26th, at the Court House, Manchester.

A. WOOD, electrical agent, 67, Bradford Avenue, Cleethorpes, and 161, Cleethorpes Road, Great Grimsby.—First and final dividend of 9d. in the £, payable at the Official Receiver's office, St. Mary's Chambers, Great Grimsby.

C. E. F. PARKER, electrical engineer, Greendale, Privett Road, Gosport.—Receiving order made September 11th, on debtor's own petition.

C. F. LINDOP (C. F. Lindop & Co.), electrician, late of 62, Dale Street, Liverpool.—Application for discharge to be heard on October 16th at the Court House, Liverpool.

J. COWAN (Cowan & Fox), merchant of electrical appliances, 35, Dickinson Street, Manchester.—First and final dividend of 8½d. in the £, payable September 29th at 30, Belgrave Place, Stalybridge.

B. E. DIXON (Creswick Dixon Electric Co.), electrical engineer, Bodega Buildings, High Street, 101a, Albert Road, 451, London Road, and 63, Chesterfield Road, Sheffield; and Electric House, Knifesmith Gate, Chesterfield.—First and final dividend of 5¾d. in the £, payable at the offices of Messrs. Popplewton, Appleby & Turner, 155, Norfolk Street, Sheffield.

Company Liquidations.—M.E.L., LTD., mechanical and electrical engineers, 45-7, King's Road, Camden Town.—The statement of affairs in this case shows liabilities of £12,331 against assets valued at £2,575. The following are creditors:—

	£		£
Abingdon Works, Ltd.	524	Reliance Electrical Wire Co.	40
Booth, J., & Co., Ltd.	192	Smith & Sons	220
Burton, H., & Co.	51	Swift, Levick & Sons, Ltd.	681
Castle, T. L.	61	Sankey, J., & Sons, Ltd.	141
Connollys, Ltd.	97	St. Pancras Elec. Dept.	32
Cundell, Eve & Co.	97	Sun Electrical Co., Ltd.	29
Curtis, P., Ltd.	40	Stokes, C. H.	377
Dacier, Ltd.	28	Sheffield Magnet Co.	260
Dyson & Co. (Enfield), Ltd.	119	Warner, W. G., Ltd.	276
Davis & Timmins, Ltd.	31	King, Sir A. F., W. Rogers, E. D. Pearcy	195
Ebonestos Insulators, Ltd.	728	Pearcy, E. D.	152
Evans, Jarvis & Sherry	126	Rogers, W.	4,381
Gas Light & Coke Co.	56	King, Sir A. F.	158
London Electric Wire Co. and Smiths, Ltd.	47	Earle, W., Exors of	573
L.P.S. Electrical Co.	95	Goulding, T. W.	631
Bankers	350	Brown, S. H.	52
Phillips (Patent Agents)	22		

WILL SMITH, LTD., electrical engineers, 281, West Derby Road, Liverpool.—A meeting of creditors was held recently at the offices of Messrs. R. Duncan French & Co., Liverpool, when a statement of affairs was submitted which disclosed liabilities of £2,028, and net assets of £43, leaving a deficiency as regarded the creditors of £1,985. The company was registered in March, 1920, with a nominal capital of £2,000, of which £1,901 had been issued, to take over an existing business, the purchase price being £600, of which £50 was payable in cash and the balance in shares. During the year ended March, 1921, there was a profit on the trading of £75, but in the following twelve months there was a loss of £295, and in the succeeding twelve months a loss of £1,100. For the twelve months to March, 1924, the loss exceeded £1,000, whilst for the year to March, 1925, there was a loss of £487. Since March last there had been further losses. Last May £200 was lent to the company on the security of a debenture. A receiver had since been appointed on behalf of the debenture holder. It was suggested that the debenture holder's claim should be withdrawn and the assets divided amongst the other creditors. The Receiver stated that he would see his clients on the matter, and the meeting was accordingly adjourned. The following are creditors:—

	£		£
General Electric Co., Ltd.	597	Rowe Bros. & Co.	88
Preston, C., & Co.	25	Loze, A., & Co.	73
Copeland, Green & Co.	35	Blakeborough Outdoor Publicity Co., Ltd.	119
Corfax Co., Ltd.	43		

HOLBORN RADIO CO., LTD.—Liquidator, Mr. G. D. Pepys, Official Receiver, Carey Street, W.C., released September 15th.

FORD ELECTRICAL CO., LTD.—A meeting of creditors is called for October 20th at 10, Norfolk Street, Manchester, to hear an account of the winding up from the liquidator, Mr. J. F. Stott.

Private Arrangements.—B. H. WISHAW and N. S. ETHELL, trading as Wishaw & Ethell, electrical and radio engineers, Bakewell Road, Matlock.—A meeting of creditors was held recently at the offices of Messrs. Heny & Heny, Matlock, when an approximate statement of affairs was submitted which disclosed liabilities of £832, all due to unsecured creditors. In addition, there were fully secured creditors for £84, who held securities valued at £100, leaving a surplus of £16. The net assets were valued at £708, leaving a deficiency of £124. Complete books of account had not been kept, so that trading figures could not be prepared. The deficiency was stated to be due to loss on trading. It was decided that a deed of assignment should be executed in favour of Mr. Charles Turner, C.A., of Sheffield, as trustee, provided the execution creditors withdrew from possession. A committee of inspection was also appointed, consisting of the representatives of the General Electric Co., Ltd., and Metro-Vick Supplies, Ltd., and Mr. J. F. Warburton, accountant, representing creditors.

Catalogues and Lists.—ACCUMULATORS OF WOKING, LTD., Maybury Hill, Woking.—Illustrated pamphlets giving particulars of accumulator batteries for house lighting, train lighting, radio work, &c.

"M.K." ELECTRIC, LTD., Wakefield Street, Edmonton, N.18.—An illustrated and priced catalogue of "M.K." switches, connectors, wall-plugs and sockets, &c.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria Street, S.W.1.—A descriptive list of three-phase induction motors. Illustrated.

MESSRS. A. J. STEVENS & CO. (1914), LTD., Wolverhampton.—A series of illustrated and priced pamphlets dealing with amplifiers and loud speakers. Also two pamphlets dealing respectively with hire-purchase and insurance schemes for radio receiving sets.

MESSRS. DAVID BROWN & SONS (HUDDERSFIELD), LTD., Park Works, Lockwood, Huddersfield.—An illustrated brochure describing the company's works and products.

MESSRS. RICHSON & CO. (1925), LTD., 113, Oxford Street, W.1.—A well-printed catalogue containing numerous illustrations, many in colour, of electric lighting fittings mainly of glass and art metal ware. Priced.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—Folders H.3764, 3765, and 3766, dealing respectively with "Magnet" electric cookers, electric fires, and domestic appliances. Illustrated and priced. Leaflet O.S. 3731, containing particulars and prices of "Osram" gasfilled lamps.

METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester.—Leaflets Nos. 35/5-1 and 35/6-1, illustrating and describing "Type C K B" high-torque, high-efficiency, squirrel-cage motors; and a price list of "Cosmos" vacuum and gasfilled lamps.

MESSRS. FALK, STADELMANN & CO., LTD., 83, 85 and 87, Farringdon Road, E.C.1.—An illustrated catalogue (No. 549) of "Lucifer" portable electric lamps and "Efesca" batteries; and Catalogue No. 547, dealing with electric bells and telephones. Both publications are fully priced.

THE CABLE ACCESSORIES CO., LTD., Tividale, Tipton, Staffs.—A priced pamphlet of tumbler switches, wall plugs, bells, &c.

MESSRS. NALDER BROS. & THOMPSON, LTD., 97A, Dalston Lane, E.8.—An illustrated brochure dealing with "N.C.S." relays for use in connection with the distribution of electricity.

DICTOGRAPH TELEPHONES, LTD., Aurelia Road, Croydon.—An illustrated booklet, advertising the firm's intercommunication system.

MESSRS. JOHN BELL & CROYDEN, LTD., 50-52, Wigmore Street, W.1.—List No. 6, containing an illustrated description of the "Arnold" osteoscope, an X-ray device for use in the fitting of boots and shoes. Priced.

MESSRS. C. A. VANDERVELL & CO., LTD., Warple Way, Acton, W.3.—Publication No. 7, containing prices and details of radio transformers, loud speakers, accumulators, &c.; and Publication No. 3, dealing with automobile lighting equipment.

Mr. L. J. Wolf, 116, Putney Bridge Road, S.W.15.—A series of illustrated pamphlets dealing with various patterns of fractional h.p. motors and fans made by the Robbins & Myers Co. (United States).

The Sun Electrical Co., Ltd., 118, Charing Cross Road, W.C.2.—A priced leaflet advertising "Radiobat" h.p. dry batteries.

Mr. A. Morgan, 138, Gower Street, London, W.C.1.—Priced leaflets relating to jack-up trucks and Osram lamps.

Book Notices.—We have received a copy of the first number of *The Wireless Dealer and Manufacturer*, a shilling monthly journal edited by Mr. J. Scott-Taggart and published by the Radio Press, Ltd. The outstanding articles are: "Tendencies in Radio Design," by Major James Robinson; "Selling Radio in America," by Mr. Percy W. Harris; "Organising the British Trade," by Mr. W. Witt Burnham; "A Talk on Demonstrating," by Capt. H. J. Round; and "Price-cutting and the Remedy," by Mr. A. H. Clifford. A good deal of space is devoted to the Wireless Exhibition and to matters of general interest to wireless dealers.

"The Decimal Educator," Vol. VIII. No. 29. September, 1925. Price 6d.—Included in an unusual number of interesting articles is one on foreign currencies and others on the accuracy of weighing in early days and Egyptian mathematics. This number also contains a *résumé* of the recently issued B.O.T. report on its work under the Weight and Measures Act.

"*Journal* of the Institution of Electrical Engineers." Vol. LXIII. September, 1925. No. 345. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

"More Things that Matter," by Lord Riddell. Pp. viii + 319. London: Hodder & Stoughton, Ltd. Price 7s. 6d. net.

"Rewinding Small Motors," by D. H. Braymer and A. C. Roe. Pp. xiv + 247; figs. 210. London: McGraw-Hill Publishing Co., Ltd. Price 12s. 6d.

"Fournier's Theorem and Harmonic Analysis," by A. Eagle. Pp. xiv + 178; figs. 25. London: Longmans, Green & Co. Price 9s. net.

British Trade-mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from September 16th:—

Dri-ac (lettering and design). No. 458,263. Class 8. Electrical secondary cells or accumulators (not for surgical purposes) in which a non-liquid electrolyte is used.—Charles George Smith, "Woodville," Oakland Road, Cheltenham.

Ammonome. No. 460,719. All goods in Class 8.—The Paterson Engineering Co., Ltd., Windsor House, 83, Kingsway, London, W.C.2.

Electrola. No. 451,070. Class 8. Instruments and devices for the recording, reproducing, transmission, or reception of sound.—The Gramophone Co., Ltd., Hayes, Middlesex.

Spartan. No. 450,073. Class 13. Electric lamps (ordinary).—Palmer, Ferris and Co., Ltd., 63, High Holborn, London, W.C.1.

Spartanite. No. 458,715. Class 40. Goods manufactured from india-rubber and gutta-percha for use in wireless telephony. No. 458,824. Class 50. Electrical insulating substances, battery jars, vents, covers, &c.—Fuller's United Electric Works, Ltd., Woodland Works, Grove Road, Chadwell Heath, Essex.

South Wales Exhibition.—The South Wales Institute of Engineers is organising an engineering exhibition to be held at the Drill Hall, Cardiff, from November 26th to December 5th. The preliminary list of exhibitors includes the following:—Daniel Adamson & Co., Ltd., Anderson Boyes & Co., Ltd., Edward Bennis & Co., Ltd., Blackstone Engine Co., Ltd., British Arca Regulators, Ltd., British Brown, Boveri, Ltd., British Engine, Boiler and Electrical Insurance Co., Ltd., "Ceag" Miners' Supply Co., Ltd., Cowlishaw, Walker & Co., H. & T. Danks (Netherton), Ltd., Davey, Paxman & Co., Ltd., De Laval Chadburn Co., Diamond Coal Cutter Co., Ltd., Electro-Mechanical Brake Co., Ltd., Evershed & Vignoles, Ltd., Film Cooling Towers (1925), Ltd., Gent & Co., Ltd., Haslam & Stretton, Ltd., Mavor & Coulson, Ltd., Oldham and Sons, Ltd., A. Reyrolle & Co., Ltd., Switchgear & Cowans, Ltd., and Turbine Furnace Co., Ltd.

Australian Preference for British Goods.—The House of Representatives has passed the Customs Act Amendment Bill, legalising the imposition of a condition that goods, in order to enjoy full preference, must be 75 per cent. of British manufacture, and granting a preference on goods, 25 per cent. of which are of British manufacture, if the preference does not clash with established Australian industries.—*Reuter* (Melbourne).

New Italian Companies.—Among the undertakings recently organised in connection with the electrical engineering industry in Italy are the Società Italiana Porcellane Elettrotechniche Pohl, formed in Milan, with a capital of 125,000 lire; the Società di Costruzzioni Elettricita Friuli Orientale, Trieste, 1,000,000 lire; and the Società Utenti Energia Elettrica, Milan, 30,000 lire.

German Electrical Combine.—It is reported from Stuttgart that a new concern has lately been formed in that town with the title F.M.O., to effect an amalgamation of the interests of three manufacturers of electrical apparatus—C. and E. Fein, of Stuttgart; Paul Meyer, of Neu-Isenburg; and the Albert Obermoser Gesellschaft, of Bruchsal. The object is to establish a joint material purchasing and sales office and the prevention of overlapping in the classes of goods produced.

New Municipal Showrooms.—Southport.—The offices of the Electricity Department have been transferred from Eastbank Street to the Glaciarium, Lord Street, which has been improved for the purpose. The premises include new showrooms.

Swansea.—On September 17th the Mayor formally opened the Electricity Department's new showrooms and offices in Oxford Street. The showrooms are arranged as a series of rooms each with its appropriate electrical equipment.

Czecho-Slovakian Company.—The West Bohemia Electricity Co. has been formed in Pilsen with a capital of approximately £74,000.

Electricity Supply Association of Ireland.—The annual meeting of this Association was held in Dublin on September 17th, when Mr. W. Hewat was elected president for the ensuing year. Among the matters discussed was the Shannon hydro-electric scheme. Mr. P. A. Spalding (Dundalk) said that while the contractors were endeavouring to pay labourers 8d. per hour, the men claimed 1s. 3d. per hour. It was estimated that 3,000 men would be employed on the scheme, and therefore the extra cost involved would be £125,000 per annum. As the carrying out of the scheme was expected to occupy three years, the total additional cost would be £375,000 for labour costs alone. Mr. Spalding asked whether the contractors or the Government would be responsible for that.

Brazilian Electrical Imports.—According to *Commerce Reports*, imports of electrical goods into the port of Rio de Janeiro during June last were considerably below normal, totalling 101 metric tons, or 819 cases. The United States and Germany, normally large suppliers of electrical goods, showed decreases as compared with the previous month's figures. The United States supplied 28 metric tons; Great Britain, 13 tons; Germany, 26 tons; the Netherlands, 14 tons; Italy, 16 tons; and other countries, 4 tons.

The Wood Market.—A timber trade correspondent writing on the present position of the wood market, says:—"In the electrical trade timber is a necessity as it is in all trades. Our own forests are so sparse that approximately nine-tenths of our wood requirements are brought from overseas. Our principal and most generally used imports are sawn softwoods, *i.e.*, pine and spruce deals, battens, scantlings and boards. Finland, Russia and Sweden, in the order named, send us the largest quantities of these, followed by Latvia, Canada, Poland, the United States, &c. Sawn softwoods are used in house construction, joinery, box and packing case work—indeed, they may be termed the 'general utility' woods, called into requisition for all kinds of work from a rabbit hutch to the carcassing of a mansion. And they are shipped to this country in almost every conceivable size for the work they have to perform. The timber market here is at present so depressed that consumers should be getting their raw material, and their clients their made-up wooden articles, more cheaply than, say, in January last. The fall in prices is due to over supplies on the market, the dull state of the staple industries of this country and their lack of call for timber, and the poor demand from Continental consuming countries. If it were not for the small boom in house-building (this *is* a record year for housebuilding), the north of Europe shippers would have made still heavier losses than those already entailed by them this season. Some authorities in the trade, however, believe that the market has now reached bottom; others, on the other hand, think timber may go a little lower in price yet. It is certain, however, that the foreign wood manufacturers are suffering heavy financial losses, which will mean restricting output and a general rise when opportunity permits. That is the general position to-day of our imported 'general utility' woods. These must not be confounded with hard woods—mahogany, oak, ash, walnut, &c., for the furniture and cabinet trades and for interior decorative work, nor with shipbuilding woods such as East India teak, pitch pine, &c. All these are firm in value and likely to get stronger."

A Valve-Selling "Campaign."—Following upon its scheme for stimulating the sale of "Osram" lamps, the General Electric Co., Ltd., has drawn up plans for a similar "campaign" in connection with its radio valves. A brochure has been prepared for the use of sellers of these valves in which particulars are given of the publicity matter which is available, as well as details of a widespread advertising scheme.

Unemployment.—After a series of increases there was a reduction in the number of unemployed during the week ended September 7th. The total at that date was 1,345,500, 8,800 less than a week earlier, but 181,850 more than at September 8th, 1924.

Sales Engineers' Luncheon.—On Friday, September 11th, the sales engineers of the London office of Metro-Vick Supplies, Ltd., were entertained to luncheon at "Simpsons" Restaurant by their district manager, Mr. E. Myhre. The principal guests were Mr. P. F. Crinks, managing director, and Mr. A. E. Iliffe, sales manager. The luncheon was arranged to take place on the same day as the visit of M-V.S., Ltd., sales staff to the E.L.M.A. Lighting Bureau to hear a lecture on "The Shop-window Lighting Campaign." The guests were afterwards entertained at the "Victoria Palace."

Army Technical Training.—The authorities announce that there will be vacancies for between 200 and 250 boys at various military technical establishments in November next. The selection of boys for the vacancies will be made by means of a competitive examination. Among the trades which are taught are electricians' work, fitting, and radio operation

Chinese Notes.—The official *Chinese Economic Bulletin* says that there has been an enormous decrease in the consumption of kerosene oil in Canton, the principal cause being the wider use of electricity for lighting in the city and neighbouring towns.

The Electrical Enterprise Co., Ltd., Harbin, is planning to start the construction of a tramway in the city at an estimated cost of $2,730,000. The Siemens (China) Co. is reported to have received the contract for the engineering work.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report September 22nd:—Copper (electrolytic) bars, £68, 15s. decrease; do. do. sheets, no change; do. do. wire rods, £78, 15s. decrease; do. do. h.c. wire, 9¾d., ¼d. decrease.

Messrs. James & Shakespeare report September 22nd:—No change in the prices of copper bars (best selected), sheet and rod; English pig lead, £41 5s., 30s. increase.

Messrs. Edward Till & Co. report September 22nd:—India-rubber, Para, fine, 3s. to 3s. 1d.

Limerick Dock Scheme.—The *Financial Times* reports that it is stated in Limerick that a sum of £150,000 has been guaranteed under the Trades Loan Act for carrying out the extension of Limerick docks and the construction of a western entrance. The work, which will probably be undertaken by Siemens-Schuckert, of Berlin, will provide further facilities for the docking of vessels of large tonnage.

New Belgian Companies.—Among the recently-formed Belgian companies are the following: l'Electricité Industrielle Belge, capital one million fr., for all industrial, commercial, or financial operations relative to electricity supply undertakings, &c.; the Société Co-operative pour l'Exploitation du Halage Electrique, to establish and work electric haulage on the Liége—Antwerp canal and elsewhere, and to produce and distribute electricity; and the Société d'Electricité de la Région de Malmedy (Serma), Brussels, capital 40 million fr., to develop the hydro-electric resources of the Warche.

Electrical Association for Women.—ST. HELEN'S WORKS VISIT.—On September 19th, in spite of the very bad weather, a large party of members visited the St. Helen's Cable and Rubber Co., Slough, and was very interested in seeing the rubber as it was received in its raw state from Central America, and the large number of operations that were necessary before it was finally ready to be used as cable covering. Tea was taken at the canteen, when a vote of thanks was proposed by Mrs. Llewelyn Atkinson to Mr. Brooking and his staff for their kindness in giving up a Saturday afternoon to show the members of the E.A.W. round their works. Before leaving each member of the party was presented with a St. Helen's hot-water bottle. This was the first visit of the E.A.W. to a cable factory.

Lighting and Power Notes.

Ayrshire.—ELECTRICITY SUPPLY.—Under the Ayrshire Electricity Board scheme an electricity supply is now being given to Dalmellington by the Dalmellington Iron Co., Ltd., from its power station. The company is now carrying out an installation at Burnfoothill and Lethanhill.

Blackhall (Co. Durham).—STREET LIGHTING.—After lighting the streets of the district free of cost since the opening of the colliery 12 years ago, Horden Collieries, Ltd., has informed the residents that it will be necessary in future to make a charge of £3 per lamp per annum for 139 lamps. This includes the cost of extra installations and maintenance.

Brazil.—SAO PAULO POWER SHORTAGE.—According to *Commerce Reports*, conditions in Sao Paulo, Brazil, have become more serious, due to continued power shortage, which has reduced the output of factories to approximately one-half their normal production. It is stated that work on the new hydro-electric plant at Rasgao is progressing satisfactorily, and construction work on the Cubatao plant, near Santos, is also going forward, and it is expected that within one year Sao Paulo will receive power from this source.

Canada.—ELECTRICAL DEVELOPMENT.—The fifth unit of the Stave Falls plant of the British Columbia Electric Railway Company, Ltd., Vancouver, B.C., has been completed. The addition of this 25,000-h.p. unit completes the enlargement of the Stave Falls plant, which now has a total capacity of 75,000 h.p. The plant, originally built by the Western Power Company, consisted of three units with a capacity of 39,000 h.p. when it was taken over by the British Columbia Electric Railway Company at the end of 1920. The latter installed a fourth unit bringing the plant's capacity up to 52,000 h.p.

The town of Antigonish, N.S., is considering installing a municipal electrical plant. The cost will be about $60,000.—*Electrical News.*

Chester.—YEAR'S WORKING.—The report on the working of the city electricity undertaking (engineer, Mr. S. E. Britton) for the year ended March 31st last, shows a total revenue of £57,048, as compared with £54,218 in the preceding year. Working expenses totalled £30,077, as against £23,840, leaving a gross surplus of £26,972 (£30,378), to which was added a grant from the Unemployment Grants Committee of £215, making a total of £27,187. Capital charges absorbed £17,547, and there was a net profit of £9,639. The result of the previous year's working was a profit of £14,704. The capital expenditure amounted to £37,482, and included £10,007 for property in Northgate Street, £9,137 for mains, and £8,962 for plant and machinery. The electrical energy sold increased from 4,238,246 to 4,883,378 kWh, and the maximum supply demanded from 2,710 to 3,191 kW.

Continental.—JUGO-SLAVIA.—A new 15,000-h.p. turbo-generator is being added to the Faal hydro-electric power station near Marburg. Work is also in hand on the erection of a permanent 10,000-V transmission line, in place of the temporary one at present connecting the plant with the nitrogen factory at Maria-Rast.

SPAIN.—La Sociedad Riegos y Fuerza del Ebro, of Barcelona, has decided to extend the plant at its Camarasa hydro-electric power station by the addition of a 14,060-kW alternator, three 4,700-kW transformers, four 8,333-kW transformers, and two synchronous condensers of 5,000- and 2,000-kW capacity respectively. The contract for the material has been placed with the General Electric Co. through its Spanish representative, the Sociedad Iberica de Construcciones Electricas, of Bilbao.

AUSTRIA.—The Teigitsch hydro-electric power station which has been erected by the Steirischen Wasserkraft und Elektricitats Gesellschaft and at present is equipped with two 13,000-h.p. sets, was recently put in operation. Electricity is being supplied at 60,000 V to the town of Gratz and Central Styria, and when a third 13,000-h.p. set is installed and the necessary transmission lines completed, part of the power will be reserved for industrial establishments in the Murz Valley and other districts of lower Austria.

GERMANY.—The Inn hydro-electric works was completed on September 6th. It is situated in the vicinity of Muhldorf and has been established by the Government of the Reich, by Bavaria, and by three large firms in the electrical and chemical industries. The works is intended to supply electrical energy for the production of aluminium and nitrogen. The constructional works have extended over five years. At present the power house has in operation seven sets, each of 5,750 kW, for supplying the aluminium smelting furnaces, and eight units each of 8,200 kW for the production of nitrogen, the total machinery installed, including a small generator, being 128,000 h.p. The average production per annum is estimated at 500,000,000 kWh. It is stated that the output of the works will amount to 10,000 tons of aluminium and 20,000 tons of nitrogen per annum.

DENMARK.—According to a recently-issued Government report there were 95 municipal central electricity stations, 40 other large stations, and 374 small country stations in operation in Denmark at the end of 1923. The total power available was 190,595 h.p., of which 101,910 h.p. was supplied by steam engines, 62,684 h.p. by Diesel plant, and the balance by miscellaneous types of machinery. The production of electricity during the year in question amounted to 194 million kW, of which nearly 80 millions was required for Copenhagen alone, where the generating stations have a capacity of 53,000 h.p. The number of electric lamps and motors in use in Denmark represented 277,000 kW and 441,000 kW respectively.

Dalkeith.—PURCHASE OF UNDERTAKING.—It was announced at a meeting of the Town Council on September 14th, that the Electric Supply Corporation, Ltd., had decided to accept the Council's offer of £18,000 for the purchase of the local electricity undertaking.

Darlington.—OPPOSITION TO ORDER.—The Rural District Council is to lodge a protest against the Darlington Corporation Electricity Extension Order unless the Corporation is prepared to include in the area of compulsory service the parishes of Haughton-le-Skerne, Blackwell, and Croft, and to exclude nine parishes which the Rural Council considers can be more favourably served by the Cleveland and Durham Electric Power Company. The Corporation has, so far, declined to accede to the Rural Council's request, and does not agree that the minimum price per kWh should be reduced from 1s. to 10d.

Dover.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £3,000 for mains.

Easingwold (Yorks.).—STREET LIGHTING.—After considering terms for street lighting offered by the Easingwold Gas, Light & Coke Company, Ltd., and by Messrs. John Charles Bannister & Co., Ltd., from Easingwold electric power station, the Urban District Council has decided in favour of the electric lighting offer. Both undertakings offered the lighting at £2 per lamp during the period of the lighting season, but the electrical offer included all maintenance costs.

Grimsby.—NEW PLANT.—Owing to the increased demand for electrical energy required for the tramway undertaking, it is proposed to move the existing converter used for this purpose to West Marsh sub-station, and to install a new converter with a capacity of from 400 to 500 kW. The cost of the scheme is estimated at £2,700, and application is to be made for sanction to a loan to cover the cost.

Hamilton.—PURCHASE OF UNDERTAKING.—At a recent meeting of the Town Council the Electric Lighting Committee reported on negotiations with Messrs. Edmundson's Electricity Corporation, Ltd., regarding the proposals for the taking over of the electricity undertaking by the Council. As to the sum to be paid by the Council for loss of profits between January 1st and May 15th next, the proportion based on last year's profits was about £1,500, but it was arranged with Mr. Rye, general manager of the company, that £1,400 should be paid by the Council on January 1st next, and that the undertaking should be taken over as from that date. The report was adopted.

Haslingden.—ELECTRICITY IN BULK.—The Corporation has decided to ask the Accrington Corporation to reconsider its terms for supplying electricity in bulk.

Hawaii.—WATER-POWER RESOURCES.—According to the *Electrical World* the Department of the Interior has prepared an estimate of the potential water-power of Hawaii based on

a study of the flow and the fall of the streams. This potential power is estimated at 174,000 h.p. for 50 per cent. of the time and 72,000 h.p. for 90 per cent. of the time. The latter is divided among the islands as follows: Kauai, 34,900 h.p.; Oahu, 5,300 h.p.; Molokai, 1,700 h.p.; Maui, 15,800 h.p.; Hawaii, 14,700 h.p. The rated capacity of the waterwheels and turbines now in use is about 25,000 h.p.

Hayward's Heath.—Special Order.—Application is being made by Mr. A. A. Hunt, engineer of the Burgess Hill and District Electric Supply Co., Ltd., and the Haywards Heath and District Electric Supply Co., Ltd., for a Special Order to supply electricity in Hurstpierpoint, Hassocks, Keymer, and Ditchling. It is proposed to erect transmission lines and obtain a bulk supply from Brighton Corporation.

India.—Trichinopoly Electricity Scheme.—The Government of Madras has authorised the Trichinopoly Electric Power Co. to commence operations and the company has been actively proceeding with the survey, demarcation and acquisition of the lands necessary, for the water-power works on the Kollimlais in order that an initial supply of 500 h.p. may be made available at Trichinopoly in the course of next year. The company will complete this work shortly and afterwards carry out the demarcation and survey of the conduit channel and emergency reservoir.—*Indian Engineering.*

Irish Free State.—Clonmel (Co. Tipperary).—The electricity scheme which has been provided at a cost of £12,500, was formally inaugurated on September 10th. Lamps of from 100 to 400 candle-power have been installed for street lighting and the scheme is working satisfactorily. Messrs. Tierney and Co., Dublin, were the engineers. The power house was built by Messrs. Roche, Morrissey & Kennedy, Clonmel; the Siemens-Schuckertwerke, Berlin, supplied the alternators, the Western Electric Company the switchgear; Messrs. Ruston and Hornsby, Lincoln, the three engines; and the Irish Electricity Supply Company, Dublin, the distribution plant. The system is so arranged as to fit in with the Shannon scheme. Some 120 business and private houses are at present receiving a supply, and it is anticipated this number will be greatly increased before the end of the year.

Keighley.—Electricity Extensions.—On September 19th, Mr. Philip Snowden, M.P., formally inaugurated extensions at the Corporation electricity station, the chief feature of which is a new 5,000-kW generating set, bringing the capacity of the plant to 15,000 kW. Mr. Harry Webber, the borough electrical engineer, in the course of the 24th annual report on the undertaking, states that this is by far the largest extension made at any time by the department. In June, 1902, after the first fifteen months' running, there were 92 consumers, in 1920 there were 967, and at the end of last March there were 2,031 consumers, who took 10,340,784 kWh. Last year's revenue was £74,069, as compared with £1,409 in the first fifteen months' period. The Corporation is still developing the electricity supply in out-districts.

Kirkintilloch.—Electricity Scheme.—The Strathclyde Electrical Supply Co., Ltd., has given statutory notice to the Town Council of its intention to exercise the powers under the Kirkintilloch and District Electricity Supply Order and to carry out the necessary work. A cable has been brought into the town and a sub-station is to be erected.

Leeds.—"All-Electric" Houses.—The Electricity Committee proposes to contribute £10 per house towards the cost of wiring the new houses which it is surging the Improvements Committee to equip, experimentally, with electrical fittings. This offer, it is stated, extends to a block of fifty of the new dwellings which the Corporation has in contemplation. It is intended that electrical appliances should be provided for cooking, lighting, and washing. The scheme is now being considered by the Improvements Committee.

London.—Islington.—The Electricity Committee has approved an estimate of £15,000 for replacing with paper-insulated lead-covered cables the rubber-insulated cables at present in use. Some of these cables were laid down when the electricity supply was first commenced.

St. Pancras.—The Electricity Committee has received the approval of the Unemployment Grants Committee to a grant of 50 per cent. of the interest on loans raised to meet the expenditure on schemes not exceeding £18,400 for linking-up the St. Pancras and Islington power stations, the re-arrangement of mains in the southern area of the borough, and the installation of h.p. mains from King's Road generating station to the Highgate sub-stations.

The Committee has requested the chief electrical engineer to report on the possibility of converting the whole of the street lamps from gas to electricity for the purpose of a grant under the Unemployment Relief Scheme.

Lowestoft.—Electricity in Bulk.—The Electricity Committee is negotiating with the Great Yarmouth Corporation respecting a bulk supply of electricity from Yarmouth.

Extension of Supply.—The Electricity Committee is arranging to give a supply of electricity to Pakefield, subject to its securing the necessary fringe Order for the purpose.

Maldon (Essex).—Special Order.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising Messrs. J. Sadd & Sons, Ltd., to supply electricity in the urban district and certain parishes in the rural district of Maldon.

Mexico.—Hydro-Electric Development.—*Commerce Reports* states that a contract has been entered into between an electric power company and the Mexican Government fixing the terms of a concession granted to that company for the use of the Conchos River for generating hydro-electric power. The present contract, which supersedes three other contracts, authorises the company to construct a dam, 70 metres high, on the Conchos River, and the necessary hydraulic works to provide power; and a dam and the necessary hydraulic works to utilise the waters of the Rio Conchos. The duration of this concession will be 85 years, beginning December 10th, 1909.

Northern Ireland.—Ballyshannon (Co. Donegal).—The Town Commissioners have accepted the offer of Messrs. Myles and Co. for the electric lighting of the main streets.

Oxenhope.—Electricity Supply.—The Urban District Council, on September 11th, decided to ask Keighley Corporation to provide a supply of electricity to the district.

Peebles.—Electricity Supply.—The Town Council is to confer with the Galashiels and District Electric Supply Company regarding a supply of electricity for the town.

Preston.—Street Lighting.—The Town Council has decided to illuminate all tramway routes and streets where electric mains are laid by electricity, and application is to be made for sanction to borrow £15,800 for the work.

Loans.—The Electricity Committee has recommended that application be made to the Electricity Commissioners for sanction to borrow £3,814 for the purchase of a rotary converter and switchgear, and £5,000 for meters.

Electricity in Bulk.—The Committee reports the receipt of a letter from the Electricity Commissioners announcing their approval of an agreement between the Corporation and the Lancashire Electric Power Co. for a bulk supply of electricity to Leyland, &c.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

St. Albans.—*North Metropolitan Electric Power Supply Co.*—Lighting: Flat rate from 7d. to 6d. per kWh; maximum demand rate, from 10d. and 2d. to 10d. and 1½d. per kWh. Heating and cooking: Flat rate from 2½d. to 2d. per kWh. Lighting, heating and cooking, annual service rate: The meter rental of 2s. 6d. per quarter to be discontinued.

Edmonton.—*North Metropolitan Electric Power Supply Co.*—Lighting: Flat rate from 6d. to 5½d. per kWh; maximum demand rate, from 9d. and 2d. to 10d. and 1d. per kWh. Heating and cooking: From 2d. to 1½d. per kWh. The surcharge of 10 per cent. on motor and industrial power rates is to be discontinued.

Tunbridge Wells.—Lighting: Flat rate, 4½d. per kWh. Heating, cooking and power: Flat rate, 1d. per kWh, or at the option of the consumer, a fixed charge of 18s. per annum for each living room and hall, and 6s. per annum for other rooms, plus ¾d. per kWh for electricity consumed, or a fixed annual charge of £1 for houses of the rateable value of £10 or under, or a fixed charge of 10 per cent. of the rateable value for houses rated at over £10, plus in each ¾d. per kWh for electricity consumed.

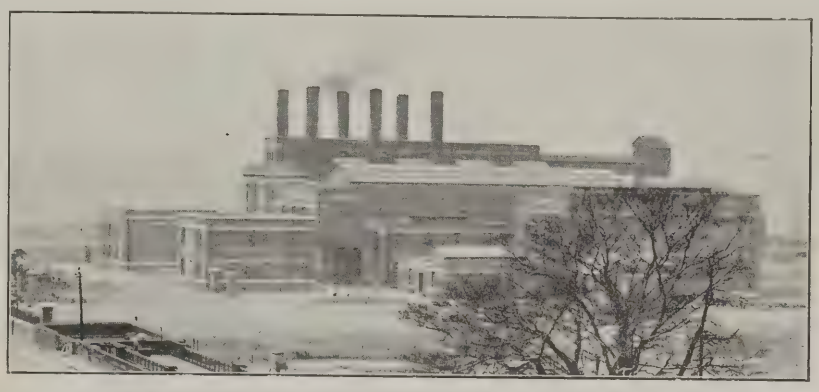
Mansfield.—Lighting: From 7d. to 6½d. per kWh. Power: From 3½d. to 3d. per kWh.

Scarborough.—Purchase of Undertaking.—The proposal of the Town Council to purchase the electricity supply undertaking of the Scarborough Electric Supply Co., Ltd., as from December 31st next has been agreed to by the company.

Stirling.—Year's Working.—The accounts of the burgh electricity undertaking (engineer, Mr. W. R. Murray) for the year ended May 15th last, record a total revenue of £16,310, as compared with £14,284 in the preceding year. Working expenses amounted to £11,324, as against £9,033, leaving a gross profit of £4,986 (£5,251), to which was added a profit on hire-purchase motors, making a total of £4,988. This was distributed as follows: Interest on and instalment of principal of money borrowed, £2,913; sinking fund, £1,394; taxes and bad debts, £681. The sales of electrical energy increased from 843,043 to 986,180 kWh, and the maximum supply demanded from 600 to 640 kW.

Straits Settlements.—Penang.—According to *Commerce Reports*, the submarine cables which are to supply Penang, Straits Settlements, with current from the new power station at Prai are said to be the longest submarine power cables that have been manufactured in one length. Each cable is 4½ miles long, and consists of six conductors, each of 0.075 sq. in. sectional area, forming a three-phase feeder of 0.15 sq. in. sectional area of conductor per phase. They are four inches in diameter, paper insulated, lead sheathed and armoured. The total weight of the submarine section is 270 tons. The normal pressure of these feeders will be 12,400 V, 50 cycles, and the test pressure will be 28,000 V.

Tanfield.—Inauguration of Sub-Station.—The new sub-station which has been erected by the Urban District Council was formally inaugurated on September 23rd.

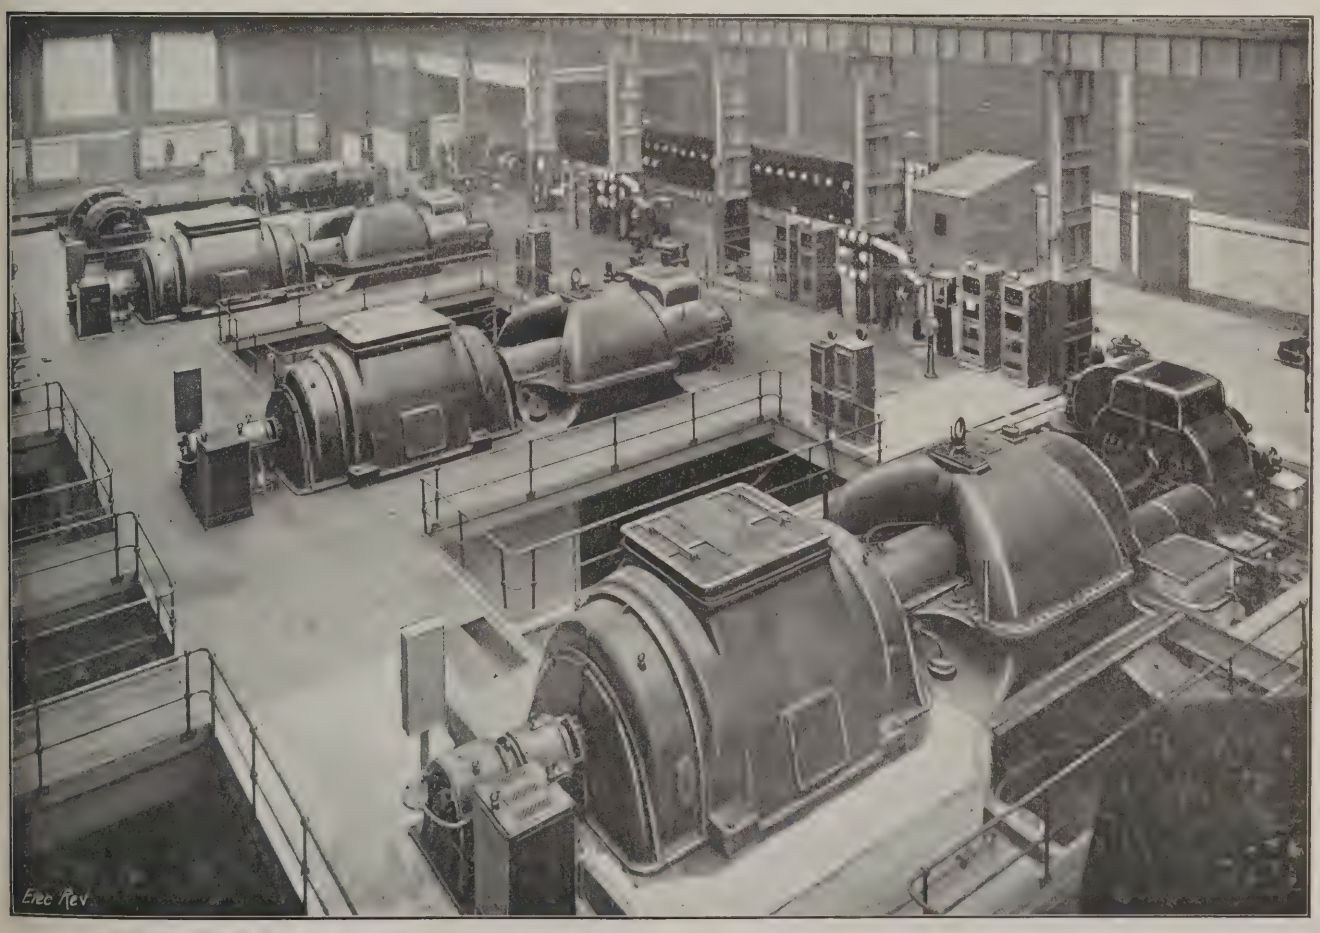


Winchcombe.—Electricity Scheme.—Mr. John Atkins, electrical engineer, of Tewkesbury, proposes to carry out an electric lighting scheme for the town. The cost of the scheme is about £4,380, towards which £2,000 has been promised, and he proposes to supply electricity at a charge of 1s. per kWh. If the necessary approval and support are forthcoming a supply of electricity will be available early next year.

Yarmouth.—Loan Sanctioned.—The Town Council has received sanction to a loan of £120,000 for extensions to the generating station, sub-stations, mains, and plant. The extensions include the installation of a 3,000-kW turbo-generator.

Electricity Supply in Salford.

The Agecroft Power Station.



The Royal Borough of Salford, though it takes just pride in its ancient Charter (dating from about 1230 A.D.), has advanced with the times, and will not brook dependence on others for the supply of that essentially modern commodity—electrical energy. Thirty years ago it commenced operations in a small way, with a 360-kW single-phase a.c. plant, of which a description appeared in our pages at the time. The distribution pressure was 3,300 volts, reduced by house transformers to 100 volts. In 1897 the central district was changed to direct-current supply at 220 and 440 volts, and the Frederick Road station, described in our issue of June 27th, 1902, was built for a capacity of 6,400 kW. Later on, turbo-generators of 3,000 kW were installed; in 1912 a bulk supply of 2,000 kW was obtained from the Lancashire Electric Power Co.; and in 1914 a turbo-alternator of 5,000 kW was added, followed by two others of the same capacity in 1915 and 1917, the three-phase system of transmission at 6,600 volts being adopted. The output capacity of the plant on the Frederick Road site was thus brought up to 18,000 kW. In 1918 the contract with the Power Co. was terminated, and a bulk supply of 5,000 kW was obtained from the Manchester Corporation, at 33,000 volts—the highest pressure used up to that date for underground transmission; the cables were put to work in October, 1919, and have proved entirely satisfactory. In 1920 a fourth generating set was installed, but it was decided to build a new power station on the River Irwell at Agecroft, and a scheme was prepared for a station of 50,000 kW initial capacity by Mr. J. A. Robertson, then borough electrical engineer, which was approved by the Council and the Electricity Commissioners in 1922. The main contracts were placed in September of that year; the first three generating sets were to have a total capacity of 37,500 kW, and the design provided for extensions up to 100,000 kW.

Cross-Courtenay, Ltd.

Fig. 1.—Exterior of Agecroft Power Station.

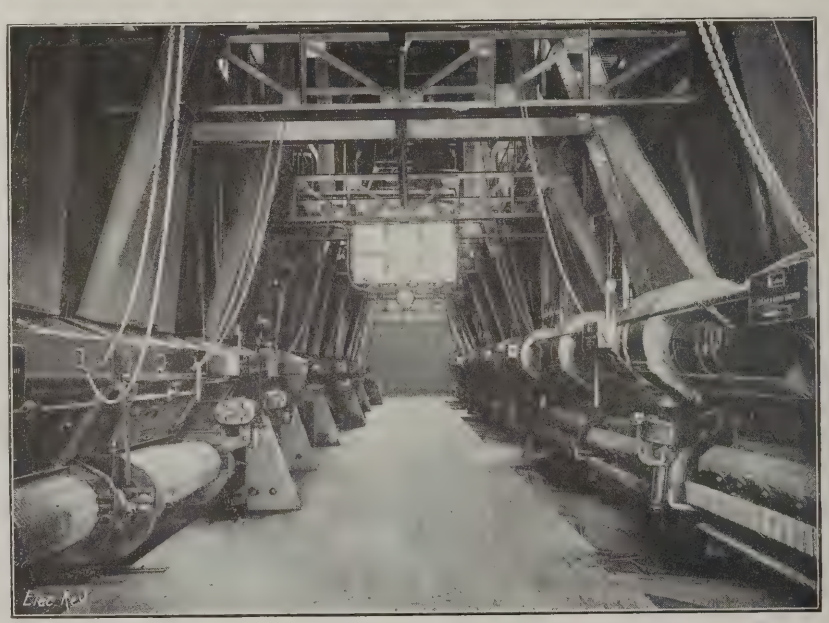
While the station is intended primarily to serve the borough of Salford, it is also one of the capital stations scheduled in the South-East Lancashire Electricity Scheme, and will be linked with other capital stations to supply districts outside the borough.

Cross-Courtenay, Ltd.

Fig. 2.—Interior of Engine Room.

The site, which covers 65 acres, is bounded on the east by the River Irwell, from which ample supplies of condensing water can be obtained; on the west it adjoins the Manchester, Bolton and Bury Canal, and the main

railway line between Bolton and Manchester. There are several large collieries in the vicinity from which supplies of coal can be obtained by road. The low-lying north portion of the site provides ample ground for the disposal of ashes. A thick bed of sandstone



Cross-Courtenay, Ltd.

Fig. 3.—Coal Elevator.

extends over the site at a depth of 12 to 15 feet, affording good foundations. The geographical position is suitable for linking-up with other large stations, the distance from the Manchester Barton station being about five miles, from Manchester Stuart Street station about six miles, and from the Radcliffe power station of the Lancashire Electric Power Co. about 4½ miles.

Condensing water is taken from the River Irwell at a point about 150 yards from the power house, whence it is conveyed through a tunnel 8 ft. 6 in. in diameter, bored through the rock, to the basement of the turbine house. After passing through the condensers, the water is returned by way of a junction chamber, through a similar tunnel to a spillway lower down the river. A screening chamber at the inlet is equipped with four circular motor-driven screens each

Cross-Courtenay, Ltd.

Fig. 5.—Boiler House.

To guard against periods of abnormal drought, four cooling towers have been erected by the Premier Cooling Co. to the north of the power station; they are capable of cooling 1,200,000 gallons of water per hour from 100 deg. to 80 deg. F., and are erected on concrete

Cross-Courtenay, Ltd.

Fig. 6.—Cooling Towers.

piers in the water-storage reservoir, which is capable of storing 2,500,000 gallons of water. When it is desired to bring the cooling towers into operation, the penstocks on the discharge side of the junction chamber can be partially or wholly closed and water pumped back through duplicate pipe lines over the cooling towers. The flow of water from the reservoir is regulated by two electrically-operated penstocks controlled from the power station. A water tunnel has been bored between the reservoir and a junction chamber on the main tunnel between the screening chamber and the power house. The water tunnels throughout are double brick lined, and the branches to the main condensers are of cast iron.

The canal is situated between the railway and the power-station site, and in view of the expenditure neces-

Cross Courtenay, Ltd.

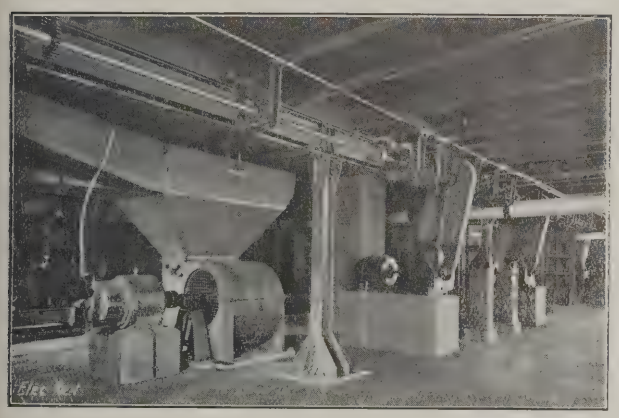
Fig. 4.—Belt Conveyor.

Cross-Courtenay, Ltd.

Fig. 7.—Part of the Screening Plant.

27 ft. in diameter, supplied by Messrs. F. W. Brackett and Co. Separate compartments are provided, controlled by penstocks, so that any screen may be closed down for examination or repair.

sary to construct bridges for sidings over the canal, it was decided to unload coal from both railway and canal at the Clifton Junction siding about half a mile away, and convey the coal by light railway to the power house.



Rail-borne coal is unloaded from a railway siding by an electrically-operated wagon tippler, which is combined with a coal-weighing machine, and delivers to a belt conveyor, whence it is discharged to a common receiving hopper on the canal bank. Canal-borne coal is unloaded by a jib crane travelling on rails on the canal bank, and is delivered to the receiving hopper. From this point a second belt conveyor transports the coal over the canal and delivers it into the dispatching hoppers, which discharge into steel trucks of about $2\frac{1}{2}$ tons capacity. The trucks are then hauled in trainloads to the power house by an electric locomotive, supplied with direct current from overhead trolley wires at 220 volts. The capacity of the system is 80 tons per hour.

At the power house the coal is emptied to the main receiving hopper and elevated by duplicate bucket conveyors to horizontal belt conveyors, which extend over the full length of the overhead bunkers, and also provide for the additional bunkers which will be required when an extension is made to the boiler house.

Cross-Courtenay, Ltd.

Fig. 10.—Basement of Engine Room.

Cross-Courtenay, Ltd.

Fig. 8.—Basement of Boiler House.

To the north of the power station branches from the light railway have been constructed to permit delivery of coal direct to the storage ground. To stack and reclaim coal a jib crane, of 30 ft. radius, and travelling on a standard-gauge railway, is employed. The crane lifts the wagons, which are provided with flap doors, from the light railway and empties them on to the stack. When reclaiming, a 2-ton grab is used which delivers coal from the stack to the light wagons. The system of weighing the coal permits of a complete check throughout, including coal taken from the storage ground.

The removal of ashes from the boiler-house basement is effected by wet conveyors comprising chain-driven links immersed in water-filled troughs, which receive the ashes from the boiler furnaces and deliver to enclosed bunkers at the end of the boiler house.

Cross-Courtenay, Ltd.

Fig. 11.—Bus-bar Room.

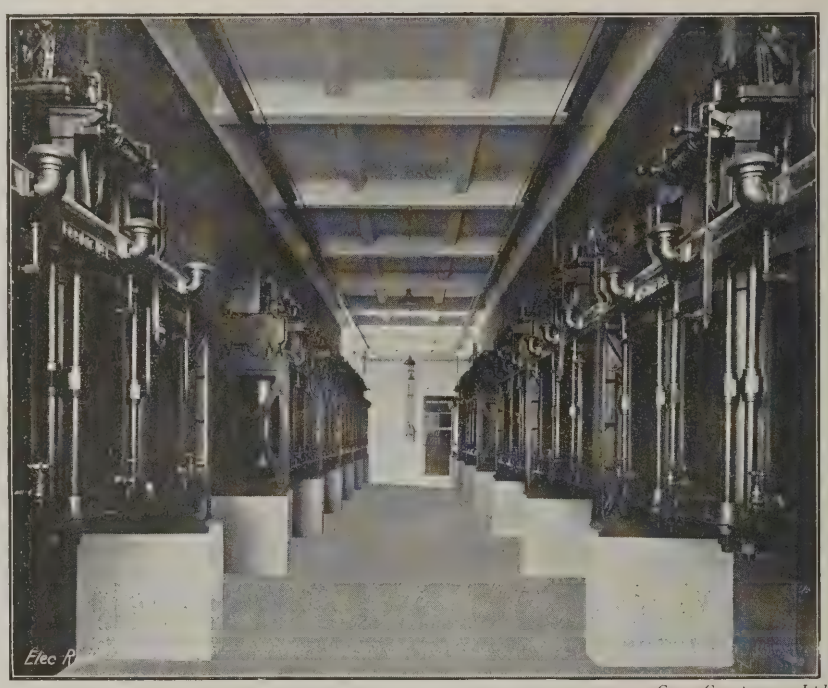
Cross-Courtenay, Ltd.

Fig. 9.—Control Room.

At present motor wagons are employed for the removal of ashes to the adjoining tip, but it is intended to utilise the light railway system for this purpose, and gradually to fill up the whole of the low-lying ground to the north of the site.

The main portion of the buildings consists of two bays—the turbine house and boiler house. The switch house is a separate building about 20 ft. from the turbine house, the space between being occupied by the 6,600/33,000-volt step-up transformers. The main buildings are of steel framework with brick filling, the external face of the walls having a dressing of Accrington brick and artificial stone. Two detached blocks provide office accommodation and workshops and stores.

The boiler house is 162 ft. long, 82 ft. wide, and 87 ft. in total height. At present six boilers have been installed, out of eight for which accommodation has been provided. The boilers are of the Babcock & Wilcox



marine cross-drum type, each rated at 65,000 lb. evaporation per hour when fired with coal having a calorific value of 10,500 B.th.u. The overload capacity is 78,000 lb. per hour for two hours. Each boiler unit is complete in itself with economiser, superheater, forced and induced draught plant, and steel chimney.

Cross-Courtenay, Ltd.

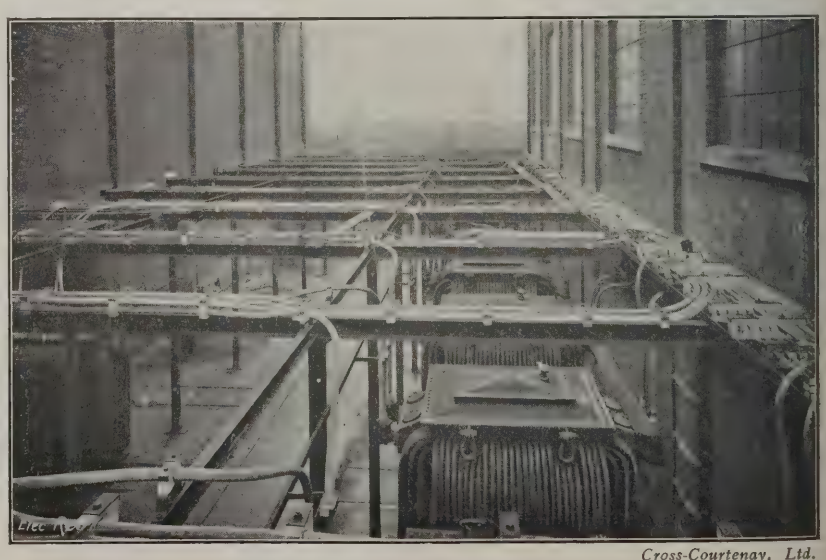
Fig. 12.—Battery Room.

The plant is constructed for a normal working steam pressure of 325 lb. per sq. in., and the superheaters raise the temperature of the steam to 720 deg. F. at the stop valve. The heating surface per unit is 9,234 sq. ft., and the economiser heating surface 7,460 sq. ft. Diamond soot blowers are fitted to each boiler. A complete set of measuring instruments, including CO_2 recorders, draught gauges, &c., is provided for each unit, and Lea coal meters are fitted to each stoker.

Cross-Courtenay, Ltd.

Fig. 13.—Oil Switchgear : 33,000-Volt Circuit Breakers, without Cubicles.

Three of the boilers are fitted with Babcock & Wilcox compartment-type chain-grate stokers, driven from a shaft in the basement. The remaining three boilers are equipped with travelling grates of the Underfeed stoker type. In both cases the grate area per unit is 340 sq. ft.



The boiler feed pumps are situated in the turbine house basement, and comprise two steam turbine-driven pumps of the Weir type, and two electrically - driven variable - speed pumps by Messrs. Mather & Platt. Each pump is capable of delivering 24,000 gallons of water per hour against the maximum boiler pressure. The steam and feed piping is laid out on the unit system, with interconnecting valves between the various sections. The whole of the boiler-house plant, feed pumps, and steam and water piping has been supplied by Messrs. Babcock and Wilcox, Ltd. The turbine house is 194 ft. in length by 90 ft. wide and 75 ft. in height, and includes a loading bay at the permanent end of the building. Three turbo-alternators have been installed, and space is provided for a fourth set. Each set is of 12,500 kW capacity at 0.9 power factor when delivering three-phase energy at 6,600 volts, 50 periods, and running at 3,000 r.p.m.

Turbines Nos. 1 and 2 are of single-cylinder design, embodying the Baumann multi-exhaust stages. During the manufacture of the first two sets, it was decided to construct No. 3 turbine as a two-cylinder machine, and to incorporate certain improvements. All three turbines are designed so that no cast-iron parts are exposed to high-temperature steam. They are fitted with the usual over-speed safety devices and oil relays for operating the valve gear.

A special arrangement of oil filtering and oil storage has been provided for the turbo sets. Each set is equipped with a Fox patent oil filter capable of dealing with 100 gallons per hour, and a general storage tank is fitted in the basement, a pump being arranged on the tank with selector valves by which make-up oil can be pumped to any turbo set.

The alternators represent the best modern practice. The stator frame is an iron casting in one piece with an air discharge outlet at the top and bottom. The windings are of the concentric type, ample bracing being provided. Ventilation is effected by air forced through the machine by fans on the rotor and also by a separately - driven blower. Air cooling is on the closed-circuit system, the coolers being situated directly under the alternators.

Each main condenser has a cooling surface of 13,000 sq. ft., and is capable of giving a vacuum of 29.05 in. with a barometric pressure of 30 in., when supplied with 11,000 gallons per minute of circulating water at 53 deg. F. The auxiliaries are driven by d.c., 220-volt motors, and comprise two circulating water pumps for each set, each capable of delivering 8,800 gallons per minute against a total head of

Cross-Courtenay, Ltd.

Fig. 14.—Outdoor Transformers.

30 ft. One motor-driven air pump of the Le Blanc type coupled in tandem with an extraction pump is provided for each set, and a two-stage steam air ejector is employed as a stand-by with a separately-driven extraction pump. It will be seen that the auxiliary plant is completely duplicated throughout.

The boiler feed water is dealt with by a completely closed system. The condensate is pumped through an integral feed-water heater and a Venturi meter into a bus main supplying the boiler feed pumps, or alternatively it can be by-passed into a special bus main connected to measuring tanks for test purposes. Above the bus main there are special surge tanks which maintain a constant pressure head on the feed pump suction. The make-up water is controlled by a ball valve which supplies direct to the condenser. Special arrangements are provided to furnish a full supply to the feed pumps in the event of an interruption of the flow of the condensate.

(To be concluded.)

Tramway and Railway Notes.

Blackpool.—TRAMWAY EXTENSIONS.—The improvements authorised by the Corporation's new Parliamentary Act include the extension of the new South Shore Promenade tramway to join the St. Annes line in Squires Gate Lane, linking up the Promenade and Fleetwood routes by a line along Queen's Square and Queen Street, a new line from Queen Street to Abingdon Street, and new lines linking up the Blundell Street depôt with Lytham Road.

Continental.—POLAND.—The construction of the first inter-urban electric tramway line between Warsaw and Zyrardow, a distance of 15 miles, which is being financed by British capital, is progressing rapidly. It is hoped to open it for traffic in December. The rolling stock, which has been manufactured in Great Britain, will arrive next month.—*Reuter* (Warsaw).

GERMANY.—The scheme which was first brought forward 20 years ago for the construction of an electric railway in Rhenish Westphalia has been revived by the formation by eleven towns in the district of a " study company " to which a concession has been granted for the carrying out of the project. In its present form the scheme contemplates the construction of a main line from Cologne-Dortmund, *via* Dusseldorf, Duisburg, and Essen to Bochum. It is estimated that the building of the lines would occupy a period of four years and involve an expenditure of £17,600,000. The Reich railway authorities have withdrawn from the scheme.

ITALY.—The Italian Government has sanctioned the expenditure of 60,000,000 lire on the electrification of the Bolzano-Brennero line (Trentino), and work will commence shortly.—*Reuter's Trade Service* (Milan).

THE TYROL.—An arrangement has recently been completed, according to *Die Wasserwirthschaft*, between the Austrian State Railway authorities and the Tiroler Wasserkraftwerke Gesellschaft, whereby the latter will, from the winter of 1927-28, supply from the Achen Lake hydro-electric power station, at present in course of construction, the electrical energy necessary for the operation of the Innsbruck-Brenner, Innsbruck-Kufstein, and Worgl-Saalfelden railways. It is stated that the contract calls for the supply of 20 million kWh per year, which represents between 25 and 40 per cent. of the output of the Achen Lake plant.

Heywood.—NEW ROUTES.—Having received from the Manchester Corporation tramway manager plans of the suggested tramway route from Hebers to Heywood, the Electricity and Tramways Committee has decided to make representations for a double line to be laid in Middleton Road and Coronation Avenue.

Newcastle-under-Lyme.—ABANDONMENT OF ROUTE.—The Potteries Electric Traction Co., Ltd., has given notice to the Rural District Council of its intention to apply to the Ministry of Transport for an Order to abandon certain tramways, including the Chesterton and Silverdale lines, which are mainly in the Council's area.

Oldham.—YEAR'S WORKING.—We have received from Mr. W. Chamberlain, general manager of the Corporation tramway undertaking, a copy of his report, together with the statement of accounts for the year ended March 25th last. The total revenue amounted to £215,615, as compared with £219,892 in 1923-24. Working expenditure was £178,852, as against £176,985, leaving a gross profit of £36,763 (£42,907). To this was added interest on investments, &c., making a total of £42,054. After providing for capital charges and rent of leased lines, a net surplus of £3,835 remained, as compared with £9,388 in the preceding year. The capital expenditure amounted to £22,750, the chief item being £16,490 on tramcars. The number of passengers carried increased from 33,410,901 to 36,364,299, and the number of car-miles run from 2,620,805 to 2,654,196. The total revenue per car-mile fell from 20.137d. to 19.496d. During the year powers were obtained to operate a system of railless cars between Oldham and Ashton-under-Lyne.

Scarborough.—PURCHASE OPTION NOT EXERCISED.—The town clerk recently drew the attention of the Corporation to the fact that the option of purchase by the Corporation of the Scarborough tramway undertaking might be exercised in 1926. The Council has decided not to exercise the option of purchase.

Telegraph and Telephone Notes.

China.—RADIO RIGHTS DEADLOCK.—The Washington correspondent of *The Times* reports that the question of the future development of radio communication in China and of the conflicting claims which arise out of the contracts between the Chinese Government and American and Japanese interests is still unsolved, and it appears as if no agreement can be reached before the holding of the conference on tariff questions next month. The Chinese proposal was to create a radio system with the aid of American and Japanese interests, but as this involved the cancellation of existing agreements with these groups, there was considerable opposition to it. A solution may be found in the formation of a consortium in which Great Britain and France would also be concerned.

Esthonia.—THE REVAL TELEPHONE SYSTEM.—It is reported that the telephone system of the capital, Reval, is to be modernised by the installation of a 10,000-line exchange. The estimated cost is given as 170 million Estmarks, and it is proposed to commence the work next year, 54 million marks being allocated to it in the Budget for that year.

France.—STRIKE.—All telegraph and telephone communication between London and Paris ceased owing to a strike of Paris operators, which took place just before noon on September 21st, when the operators left their instruments. The staffs in Paris and the provinces came out on strike for two hours by order of their trade union, to protest against the decision of the Salaries Commission in giving the maximum salary of 12,000 francs to schoolmistresses while women telegraphists and telephonists were given 9,200 francs. The strike commenced at eleven o'clock and lasted until one o'clock.

The Telephone Service.—The latest Post Office statistics for the whole country show that the increase in the number of telephones for the last quarter was 29,678, or 2.3 per cent. This figure is rather lower than that for the two previous quarters. While the volume of traffic continues to increase, as a result of connecting up new subscribers, the calling rate per line shows a tendency to fall. The number of trunk calls made during one month was 6,699,876, an increase of 580,9[illegible] calls, or 9.5 per cent. more than the figure for the corresponding month last year. The average number of calls made per working day was 273,464—the highest on record.

STREET KIOSKS.—Public street telephone kiosks, the first in the town, are about to be erected in several places in Barrow-in-Furness.

Radio Notes.

Australia.—REDUCTION OF LICENCE FEES.—The *Melbourne Age* announces the reduction of the fees for broadcasting licences as from August 1st. The new rates, if paid for twelve months in advance, are stated to be 27s. 6d. for Zone 1, 25s. for Zone 2, and 22s. 6d. for Zone 3. It is also said that, if desired, the fees may be paid in two six-monthly instalments; in this case, states our contemporary, instalments will be 15s., 12s. 6d., and 10s. respectively. We think that we can guess which system will be favoured by listeners in Zone 3!

NEW STATION.—Most of the additional apparatus required for increasing the power of 3LO to its licensed power of 5 kilowatts has been completed at the factory of Amalgamated Wireless (Australasia), Ltd., in Sydney. The *Industrial Australian and Mining Standard* expects that the new high-powered apparatus will be installed at Braybrook and transmission resumed on full power about the middle of next month. When the wavelength of 3LO was reduced from 1,720 metres to 371 metres about two months ago, the modulation system was considerably altered to improve the signal strength and the quality of the modulation. The new station being erected by the Associated Radio Co. at Essendon is nearly completed, and it was hoped that the services from 3AR would be carried out from it this month. Apparatus for the transmitter is completed, and the aerial system at the station is erected. The power will be 1,600 watts, the present licensed power of the Melbourne station, but it is expected that signals from Essendon will be much louder than they were from the station in the city. In addition to the alterations at the station, extended alterations to the studio of 3AR are being carried out, and it is the intention of the Associated Radio Co. to apply to the Postmaster-General for a licence to use five kilowatts at the new station.

Austria.—NEW STATION.—It is reported from Berlin that the Telefunken Gesellschaft has secured the order for the construction of the new broadcasting station in Vienna, in competition against American and British tenders. According to the *Daily Mail*, before placing the order, the Austrian Government consulted an international college of 24 experts as to which system was the best in practice. The Vienna station is to be two and a-half times as powerful as the station just erected in Berlin.

Licences.—Warning to "Pirates."—The Postmaster-General has issued a further warning to those who possess unlicensed receiving sets. He states that the short Act passed a few weeks ago places beyond doubt a legal obligation upon listeners to take out a licence. He intends to institute proceedings in any case of unlicensed reception which may come to his notice in the future.

Philippines.—Radio Development.—*The Telegraph* and *Telephone Age* states that radio has made tremendous strides in the Philippines during the past year, and has proved an ideal means of communication in this immense group of islands stretching 1,000 miles north and south and over 600 miles east and west. The Philippines legislature has granted a fifty-year concession to the Radio Corporation of America and the Far Eastern Radio, an affiliated company, and installations to cover the whole country are proceeding rapidly. The terms of the concession provide that within a year the radio company must have in operation a broadcasting station that will reach every part of the archipelago. The company is authorised to handle all ship-to-shore and shore-to-ship business as well as commercial wireless business to and from other countries.

United States.—Radio on the Farm.—The American Department of Agriculture, basing its conclusions on a national survey, has just declared that to-day 550,000 American farms are equipped with radio receiving sets, compared with 365,000 a year ago, and 145,000 in 1923. The State of Illinois leads with 46,000 farm sets, and New York and Iowa each possesses 39,000. Delaware is at the bottom of the list with 200.—*Manchester Guardian.*

Contracts Open and Closed.

METROPOLITAN POLICE

Electrification of lift, New Scotland Yard.—Express Lift Co., Ltd.

Grimsby.—Electricity Committee. Accepted:—

Battery, booster, and switchgear (£7,037).—Tudor Accumulator Co., Ltd.
Spare transformer (£275).—Hackbridge Electric Construction Co., Ltd.

Irish Free State.—DUBLIN.—Commissioner of Public Works.

Electric lighting, McKee Barracks.—Haden's Engineering Co., Ltd.

The following contracts were placed by the Controller of Stores, Department of Posts and Telegraphs, during August, 1925:—

Dry batteries.—Ever-Ready Co. (Gt. Britain), Ltd.
Dry cells for batteries.—Tyer & Co.
Cable.—British Insulated & Helsby Cables, Ltd.
Ducts.—Standard Brick Co.; Oates & Green, Ltd.
Fuses.—Phœnix Telephone & Electric Works, Ltd.
Insulators.—W. J. Kellie.
Insulator rings.—MacIntosh & Co.
Switchboards.—Western Electric Co., Ltd.
Wire.—British Insulated & Helsby Cables, Ltd.
Creosoted wood troughing.—Eustace & Co.

—*Irish Builder and Engineer.*

Kettering.—Electricity Committee. Accepted:—

Cooling tower and tank (£2,800).—Davenport Engineering Co., Ltd.
Circulating-water pipes (£1,250).—Brightside Foundry & Engineering Co., Ltd.

Lamp Contracts.—The Stores Department, General Post Office, has placed contracts for 12 months' supplies of electric lamps with Edison Swan Electric Co., Ltd., Metro-Vick Supplies, Ltd., and Siemens & English Electric Lamp Co., Ltd.

London. — ISLINGTON. — Electricity Committee. Recommended:—

50-ton electric crane (£8,155).—Babcock & Wilcox, Ltd.

ST. PANCRAS.—Electricity and Public Lighting Committee.

One 10,000-kW turbine, with alternator, condensing plant, steam and water circulating pipes, &c.

Fifteen complete tenders and six tenders quoting for the condensing plant only were received. Five tenders were from foreign firms, and the Committee, being of opinion that the Council would desire the set to be of British manufacture, has given consideration to the offers made by British firms, and recommends the acceptance of the tender of the Brush Electrical Engineering Co., Ltd., at £40,660.

Oswaldtwistle.—

Electrical installation at Holy Trinity Church.—Mr. W. Kirkham.

Southend-on-Sea.—Town Council. Accepted:—

Spares for Diesel engines:—
12 exhaust valve boxes (£420), three inlet valve boxes (£96), and one set of intercoolers (£135).—Belliss & Morcom, Ltd.
One cylinder head cover (£140).—Thompson, Watts & Co., Ltd.

Stoke.—Stoke and Wolstanton Board of Guardians. Accepted:—

Electrically-driven pumping plant (£775).—Couzens & Akers, Ltd.

Swansea.—Electricity Committee. Accepted:—

Grit catcher at sub-station (£430).—Tipton Tub and Tube Co.

Yarmouth.—Electricity Committee. Accepted:—

Cable (£8,936).—British Insulated & Helsby Cables, Ltd.
3,000-kW turbo-generator (£21,220).—Brush Electrical Engineering Co., Ltd.

Forthcoming Events.

Birmingham Electric Club.—Friday, September 25th. At the Grand Hotel, Colmore Row. At 7 p.m. Lecture on "The Theory and Application of the Thermionic Valve," by Mr. G. C. Marris.

Faraday Society.—Thursday and Friday, October 1st and 2nd. At Jesus College, Oxford. Discussion on "Photochemical Reactions in Liquids and Gases."

Junior Institution of Engineers.—Friday, October 2nd. At 39, Victoria Street, S.W. Lecturette, "Problems of Broadcasting," by Mr. H. Bishop.

Electrical Power Engineers' Association.—October 2nd. Lecture by Mr. J. T. Ruddock, "Notes on Boiler and Chain-grate Operation." At the Institution of Electrical Engineers, Victoria Embankment, W.C.2.

Smoke Abatement Conference.—Friday, October 2nd, to Monday, October 5th. At Buxton.

Notes.

Electric Iron Test.—We learn that at one of the hotels at Ullapool, Ross, a laundry-maid by mistake left a "Magnet" electric iron switched on at about 8 o'clock at night and it was still on at 9 a.m. next morning. The iron had burned through a two-inch deal table and dropped right through and was hanging by the flexible cord in the morning. On examination the elements of the iron were found to be in good condition.

Fatality.—In the London City Coroner's Court, on Monday last, Dr. F. J. Waldo, the City Coroner, held an inquest with reference to the death of Valentine George Sinden, aged 36 years, fireman sub-officer at East Greenwich station, who was killed when a fire broke out on Friday last at 2, Byron House, Finsbury Street, E.C., premises occupied by Mr. Max Kracke, a toy and fancy goods dealer. It was stated that the deceased man was playing water on the fire when his helmet came in contact with an electric wire, and he fell back groaning, and was taken unconscious to St. Bartholomew's Hospital, where he died shortly afterwards.

Station-Officer Stonestreet, attached to the Redcross Street station, was asked by the Coroner: "Do you take special precautions when you are aware that there are live wires about?"

Witness: No, sir, we accept the risk, especially if the wires are only for lighting purposes.

Giving further evidence, he said that the metal part of Sinden's helmet came into contact with a tube containing a live wire.

Mr. Martin, house physician at St. Bartholomew's Hospital, said that artificial respiration was tried for an hour and a half, and injections were made, but without result.

Sir Bernard Spilsbury gave evidence that he could find no natural cause of death, and he had come to the conclusion that death was due to electric shock. The witness was asked by Mr. Pawlyn, who appeared to represent the L.C.C., if he had ever known a voltage of 210 volts to kill a man, even if his clothes were wet. In reply, Sir Bernard said that such cases were, of course, very rare, but there had been fatal cases from even a lower voltage. He was of opinion that if the current were transmitted through a man's head the risk would be materially increased.

Mr. Pawlyn: I am told that nearly every man in the Fire Brigade from time to time receives shocks from electric wires, and this is the first time we have heard of one having fatal results.

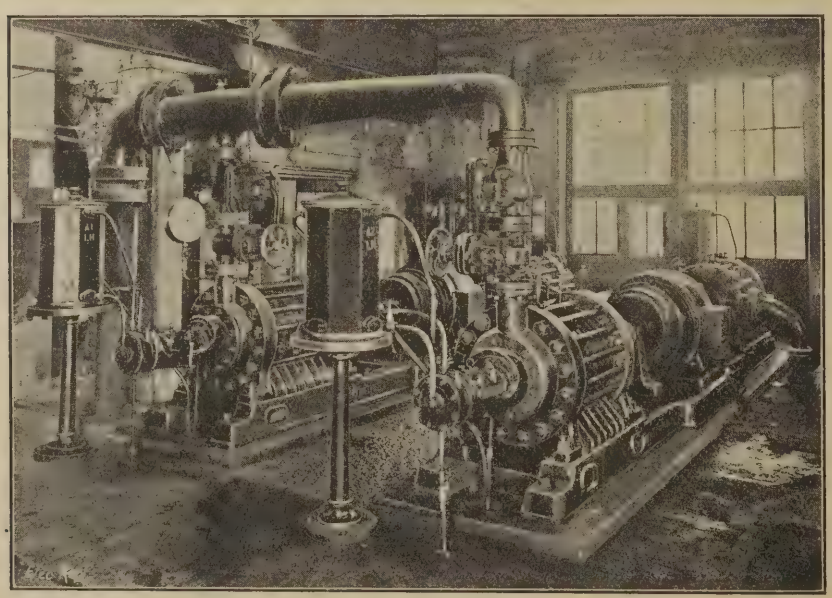
At the request of the Coroner, the jury then viewed the premises, and on their return Mr. Roberts, electrical engineer to the City Corporation, said that, so far as he had seen, and from what he had heard from the witnesses, he did not think the fire was caused by electricity. In this building slip tubing was used, but the Institution of Electrical Engineers had now agreed that only screwed tubing should be used. The man must have been standing in some water, which would have intensified the shock.

In summing up, the Coroner said that the L.C.C. should take precautions in future against firemen using helmets that could conduct electricity, as he knew that some firemen used leather helmets, which were safe.

The jury returned a verdict of "Accidental death caused by electric shock," and added that, in their opinion, electrical installations should be brought up to date, and steps taken to prevent further accidents.

The Second World Power Conference and Executive Committee Meetings.—A meeting of the International Executive Committee was held in London on July 27th-30th. Twenty countries were represented and the representatives welcomed Mr. O. C. Merrill, Executive Chairman of the American National Committee, who crossed the Atlantic for the express purpose of being present. Plenary meetings of the International Executive Committee and meetings of Sub-Committees were held throughout the period July 27th-30th. After the chairman, Mr. D. N. Dunlop, had made a formal report regarding the publication of the Transactions of the First World Power Conference, and other matters arising out of the first Conference, various questions relating to the future activities of the movement were discussed.

An invitation was presented on behalf of the Swiss National Committee by Dr. E. Tissot, to hold the Second World Power Conference at Basle in 1926, on the occasion of the International Exhibition for Inland Navigation and Utilisation of Hydraulic Power. It was, however, the unanimous opinion of those present that a longer period than one or two years was necessary between each plenary session of the World Power Conference, and that probably 4-6 years was the proper interval. But with a view to keeping interest alive between plenary conferences and to securing general progress in the fulfilment of the objects of the World Power Conference, it was decided to hold sectional meetings under the auspices of the International Executive Committee. These sectional meetings, which should originate on the initiative of individual National Committees, may be held in different geographical areas to discuss a programme of specific subjects within the general conference programme, and general invitations to participate will be extended through the central office in London to all the National Committees and representatives. An invitation was accordingly transmitted to the Swiss National Committee to hold a sectional meeting at Basle in 1926. The International Executive Committee recommended that this meeting should deal with the following subjects:—The development of hydro-electric power combined with inland navigation; the inter-exchange of electric power between countries, to be studied particularly from the financial and legal points of view;



the economic relation between hydro and thermal power; electricity in agriculture; and railway electrification.

It was further recommended that the programme of the sectional meetings at Basle should lay stress upon the financial and economic aspects of these subjects. The question of a properly constituted international form of organisation was considered by a sub-committee appointed for that purpose. It drafted a constitution which was approved by the International Executive Committee and will be submitted to the National Committees for consideration, and if possible will be finally approved with whatever amendments are suggested at the next meeting of the Committee which it is proposed should be held at the time of the Basle sectional meeting in 1926.

To facilitate the carrying out of the objects of the World Power Conference and to maintain contact between the various National Committees and representatives of the participating countries, the International Executive Committee recommended that a "Journal of the World Power Conference" should be published at fairly regular intervals under its auspices. It envisaged that this journal would contain articles, statistical information, reports and data regarding progress in matters coming within the objects of the World Power Conference, and the committee placed it on record that the journal, as the official organ of the World Power Conference and the medium for the exchange of information between the constituent National Committees, should not conflict with nor overlap the functions of existing technical publications or journals published by scientific and technical institutions.

It was decided, subject to reconsideration, that the Second World Power Conference should be held in 1930, and on the invitation of the Italian Government that it should be held in Rome if conditions at that time were comparable to those at present existing.

Electrical Plant at the Southampton Docks.—In our last issue we published an abstract of a paper upon the above subject, which was read by the Dock Electrical Engineer (Mr H. Wauchope) before the Engineering Section of the British Association. In this abstract mention was made of the pumping plant supplied by Messrs. Mather & Platt, Ltd.; we have now received a photograph of some of this plant, and it is reproduced herewith. The equipment illustrated comprises two 17-stage turbine pumps which are installed in the No. 3 pumping station to provide the necessary hydraulic power for the pumps used for de-watering Nos. 1, 2 and 3 dry docks. Each pump is designed to deliver 200 gal. of sea water per minute against a pressure of 750 lb. per sq. in. The pumps are driven by 3-phase slip-ring induction motors rated at 165 b.h.p., and running at 1,450 r.p.m., with supply at 415 V. The starting and stopping of the pumps is automatically controlled by tappets on the hydraulic accumulator.

Mather & Platt Pumping Plant at Southampton.

Lecture.—Mr. Harry Moss is to deliver a lecture on "Modern Developments in Electric Lighting for Industrial Purposes" before the Bradford Engineering Society at the Technical College, Bradford, on October 12th.

Association of Special Libraries and Information Bureaux.—A conference is to be held at Balliol College, Oxford, during the week-end September 25th-28th, under the auspices of the above Association. The subjects to be considered include the present position of the Special Library movement; informational work in the spheres of politics, business, science, engineering, transport, medicine, and patents; public and university libraries, and so forth. Amongst those intending to be present are representatives of Government departments, learned societies, research associations, the technical and general Press, public libraries, the leading electrical manufacturing companies, &c. Papers are to be read on "Decimal Classification" (Prof. A. F. C. Pollard), the "Co-ordination of Technical Intelligence" (Major W. E. Simnett), "Efficient Filing" (Mr. R. Borlase Matthews), "Research as the Basis of Advertising" (Mr. S. Wood), "Patents and Special Libraries" (Mr. H. E. Potts), and many other subjects. The address of the organising secretary is 38, Bloomsbury Square, London, W.C.1.

Collisions on the Southern Railway.—Reporting on three buffer-stop collisions which occurred at Guildford station on the Southern Railway in July last, Major G. L. Hall states that they were not due to any defect in the brake equipment, but to lack of experience in the working of the Westinghouse brake. The collisions were of a minor character, and of the type which would be eliminated by further experience.

Appointments Vacant.—Shift engineer, for the Borough of Southport electricity department; clerk (50s.), for the Basingstoke Corporation electricity department; showroom attendant (£250), for the Borough of Mansfield electricity department.

Nottingham Electricity Supply.—Last week one or two minor disturbances took place in the supply of electricity to Nottingham, and on Saturday evening the supply was cut off for some time. The mishap had no relation to the operation of the plant in the new power station at North Wilford, which has run quite satisfactorily from the commencement; we understand that it was due primarily to a faulty connection on the switchgear at the Talbot Street station, which is being converted into a sub-station receiving a 3-phase supply at 11,000 volts from North Wilford. The low-pressure three-wire system was also temporarily disorganised on Saturday in the central area.

North Swedish Copper Deposits.—In connection with the recent Swedish discoveries of copper and pyrites ore, prospecting has been going on since 1920. Loose lumps of copper pyrites have been found for 20 years or more in the district, which has led to the registration of claims on different occasions. The mother lode was discovered in 1920, and proved to be the centre of a new ore field extending some 40 miles east and west, being about 6 miles broad. Investigations carried on by the Geological Survey and the Centralemissions concern led to the discovery of important lodes, but the work is by no means concluded. In parts, *e.g.*, at Bjurfors (owned by the Government) there is pure copper ore, but for the rest the copper and sulphur pyrites ores alternate, or are mixed together, containing in places gold, silver, and arsenic in economically workable quantities. The Government and Centralemission Banking Syndicate own the ground and claims in practically the whole district, although there appear to be some outsiders owning stray claims. The prospecting has cost the bank about a million kroner and it has been made possible by the Lundberg electrical ore detection method. The practical value of the method is said to have been proved. Nearly the entire district is covered by a layer of earth, in general about 60 ft. thick, the rock being but rarely seen and the cost of removing such great masses of earth would have been almost prohibitive, but when the probable extent of the ore bodies had been determined by the electrical method, it was comparatively easy to carry out the necessary deep drilling. The ore is present at the very surface of the rock, underneath the layer of earth, and all that will be required before starting operations is to remove the earth. The deposit to be worked immediately was not discovered until about six months ago; it lies within reach of a sea port, the distance to Skelleftea being about 18 miles. The pyrites here contains some 5 or 7 per cent. of copper. The larger deposits, however, depend for their operation on the construction of a railway branch line. Negotiations are now being conducted for leasing both the bank's and the Government's deposits to a mining company, which is to commence operations after a railway has been built. The deposits already located should be sufficient to cover the present Swedish importation of copper and pyrites. This is one of the most important ore finds in Europe in recent years.—*Swedish Export.*

Birmingham Electric Club.—The first event of the half-session is the delivery to-night, Friday, of a lecture on "The Theory and Application of the Thermionic Valve," by Mr. G. Chris Marris. Subsequent events in the programme are:—October 16th, "Power Factor Improvement as Affecting the Economical Running of Works Plant," by Mr. F. C. Hall; November 13th, "Submarine Cable Manufacture and Laying," by Mr. H. Gurney Wood. All of the foregoing will be illustrated by lantern slides and the meetings will be held at the Grand Hotel, Colmore Row, Birmingham, at 7 p.m.

Midland Electrical Engineers' Ball.—It has been decided to hold the Midland Electrical Engineers' Ball this season at the Grosvenor Suite, Grand Hotel, Birmingham, on Friday, November 20th. Mr. R. A. Chattock is the president, and Mr. W. H. Heaton the chairman, and Messrs. N. A. Collard, Daimler House, Paradise Street, Birmingham, and W. Y. Anderson, 14, Dale End, Birmingham, are acting as joint honorary secretaries. Tickets are one guinea each, and may be obtained from any of the above-mentioned gentlemen.

Alleged Practical Joke Fatality.—On September 18th, an inquest was held into the death of Charles Angus, Glasgow, who received a fatal electric shock as the result of an alleged practical joke. Deceased was employed in the Tollcross works of Brown & Macfarlane, iron and steel merchants, and on August 25th he met his death by touching the handle of a door to which a "live" wire had been attached. The manager of the works said the current passing had a pressure of 250 V. A formal verdict was returned by the jury. A 17-years' old boy named Gray is in custody in connection with the tragedy.

Liverpool Electro-Harmonic Society.—This Society enters upon the second year of its existence on October 23rd. The increase in membership has enabled the Society to transfer its meetings to the Bear's Paw in the Rotary Room, but in order to secure further success a very much larger membership is necessary and gentlemen connected with the electrical trade in the district are urged to get into touch with the secretary, Mr. E. Y. Wilkinson, c/o The British Thomson-Houston Co., Ltd., 14, South Castle Street, Liverpool, with a view to joining. The Society holds monthly meetings—on the fourth Friday in the month, excepting in December, when the third Friday is the appointed day. The first concert takes place on October 23rd. Old friends have been engaged, including the Zingara Quartet, Mr. Ben Woods, comedian, and Mr. Wm. Cross, pianist. The subscription is 10s. 6d. per annum.

Works Visits.—On September 10th a party of members of the Iron and Steel Institute paid a visit to the Witton Works of the General Electric Co., Ltd. The company entertained the party at luncheon; Dr. Railing occupied the chair, supported by the president of the Institute, Sir Frederick Mills, and Sir Robert Hadfield.

On September 16th members of the Manchester Association of Engineers visited the works of the British Insulated and Helsby Cables, Ltd., Prescot. During the tea which followed the tour of the works, the president, Mr. R. Onions, expressed the thanks of the visitors, and Col. Bates, the works manager, briefly responded.

Wood Separators for Accumulators.—Some experiments with regard to the electrical resistance and mechanical strength of storage-battery separators have recently been carried out by the United States Bureau of Standards. The life and internal resistance of accumulators depend largely upon certain properties of the separators, which are usually made of wood. In the tests the electrical resistance of the separators was measured by placing a specimen in an electric circuit consisting of two branches supplied by a transformer having two secondary windings. The current from one of the secondary windings was passed through a known area of the separator to be measured. The current from the other winding was passed through a slide wire and resistance box which served as a potentiometer. The accuracy of the method was within 1 per cent., which was sufficient for the purpose, since the resistance of the different samples of the same kind varied by as much as 15 per cent. The results of the measurements of the resistance and mechanical strength show the effects produced by the different conditions to which the samples were subjected. The results, in general, were as follows:—Electrical Resistance.—(*a*) The resistance was found to change for some time after immersion, but became practically constant after two or three weeks. (*b*) The resistance was proportional to the resistivity of the acid in which the sample was immersed. (*c*) The resistance of the separators treated by the caustic-soda method was lower than for like samples treated by the steam method. (*d*) The temperature coefficient of resistance was approximately the same as the coefficient of resistivity for sulphuric acid solutions of the same density. (*e*) The resistance of samples of different thicknesses, but identical in other respects, was approximately proportional to their thickness. (*f*) The resistance of the sawn separators was smaller in most cases than that of the rotary cut samples. Mechanical Strength.—(*a*) Immersion in acid solutions was found to weaken the wood fibres. The strength decreased with time of immersion and concentration of the solution. When the specific gravity exceeded 1.300 the action was severe. (*b*) The strength decreased with increase of temperature of the acid solution. (*c*) The strength was approximately proportional to the thickness of the samples.

Street Lighting.—Mr. R. F. Brown, a surveyor of Clacton-on-Sea, has invented and patented a method of illuminating electrically the white lines used at dangerous street corners. The Ministry of Transport has expressed appreciation of the idea, and is having an experiment made at Whitehall, while the practicability of the invention is also to be tested at Brighton and Clacton. Mr. Brown's novel idea consists of the use of channelling carrying a line of white marble with a strip of thick plate glass down the centre, electric lamps being placed at intervals below the glass.

Electricity Supply Association of Ireland.—THE SHANNON SCHEME.—At the annual meeting in Dublin of the Electricity Supply Association of Ireland, the report, which was adopted, stated that the Association was not in agreement with the Shannon scheme as formulated and directed by the Government, regarding it as objectionable and not in the best interests of the country, to allocate a contract to any firm without the usual open competition. The Council had come to the conclusion that the scheme would entail an expenditure that would not be warranted by the condition of the country, or by the possible demand for power, and it was of opinion that the better course would have been to retain independent expert consultants of repute in the first instance to survey the main sources of power and to investigate the probable demand. On the report of these consultants would be based the programme for the future. If the State then decided to embark on national power supply, the contracts for the works decided upon would be allocated by public tender, on the basis of specification prepared by the independent consultants.

The country was now definitely committed to State electricity supply from the Shannon, and the Association was prepared to co-operate fully in the work of getting the best possible results out of the scheme adopted, whilst at the same time assisting to safeguard the interests of its members.

Boiler Litigation in the United States.—In the United States District Court of New York recently the Babcock and Wilcox Co. alleged the infringement of its patents by the Springfield Boiler Co. and the Superheater Co. The judge held that while the boiler in question (which was installed in the Hell Gate station of the United Electric Light and Power Co., New York) was of a construction which might bring it within the reading of the claims of the Pratt patent and, if a liberal interpretation was given, of the Bell patent, the question whether such readings should be made necessitated reference to the development of the boiler art of the present day. According to the *Electrical World*, in delivering his decision, the judge said:—"The net result of my examination of the facts in this case is that defendants have constructed a type of superheater water-tube boiler that differs materially from that shown and claimed by the patents in suit, and that it is accomplishing results which, if they were contemplated by Pratt and Bell, are brought about by a construction that avoids any valid claim of infringement of the patents granted upon their inventions. It follows that the claim must be dismissed." An appeal may be entered by the plaintiffs.

The Passing of the Ampere.

I am the cunning Ampere, swift as light
I speed along my copper bands and fling,
Burning, my vital force to move great deeds.
Great is my master Volta, it is he who moves
On our swift path my brethren and myself,
Braving the hostile Ohms who stay our flight
In vain; mocking and burning them awhile
To the full square of our numbers; anon,
The children of our sojourn, born methinks
In fields of force, now linking hand with us,
Cast wide their potency and urge to life
Amperes new-born along some other line.
Seductive Millihenries hail—we stay,
Lagging behind our master; and to haste
Errant these footsteps, summon to our aid
Fierce Microfarads from their house of power,
Quickening our laggard feet. Now race ahead,
Speed on my brethren—death to yonder fuse!
Burst we these copper bands, vanquish in fire
Delicate instruments sapping our strength!
Now glow these copper fiends, they cannot hold
Aught of our mightiness; on, brethren, on!
Smoke rises round us . . . they fail! we triumph!
(*Crash! The breakers come out.*)

. . . . . .

Brethren, I'm failing; fast wanes my power.
Volta is dead, and life's cord is broken.
I'm waning and dying—dying—dying—
The circuit's at an end. . . .

—A. G. H. DENT.

An Electric Refractory Furnace.—There has been erected at Gustafsberg, near Stockholm, an electric tunnel kiln for use in the firing of teacups. It is 6 ft. long by 2 ft. wide and into it is placed a truck about 2 ft. wide and 2 ft. long with a capacity of 3,000 cups. It is stated that the cost of energy is two or three times less than would be the case if a directly-fired coal kiln were used for the purpose. Moreover, the control of the heat, and the temperature obtained are such that the ware is in the heat zone only a quarter to half the time necessary with a coal-fired kiln, whilst the temperature is only limited by the risk of cracking the pottery as it goes through the hot zone. Some interesting features are claimed in the design of the electrical control arrangements.

An Abortive Electricity Commission.—Some time ago the Government of New South Wales appointed a State Commission to inquire into the question of the supply of electricity in Sydney and its surrounding districts, as well as the whole of the State. Last month, however, the Premier (Mr. Lang) announced that the Commission had not functioned and the appointments had not been gazetted. The Commission had therefore been allowed to lapse.

Institution Notes.

Institute of Metals.—The programme for the session 1925-26, which begins in October, shows that six lectures on metallurgical subjects are to be given during the winter months before each of the Institute's six local sections. The programme also includes particulars of the meetings of the parent Institute in London; one of these is the 1926 May lecture, to be given by Professor H. C. H. Carpenter, F.R.S., on "Single Metallic Crystals and their Properties." A copy of the programme can be obtained from the Secretary of the Institute, 36-38, Victoria Street, S.W.1.

Institute of Transport.—The programme of meetings includes the following:—

Friday, September 25th.—North-Western Local Section, at Midland Hotel, Manchester. Discussion, "Underground Railways for Manchester."

Monday, October 5th.—Ordinary meeting at Institution of Electrical Engineers, London. Presidential address by Col. Sir Joseph Nall, D.S.O., T.D., M.P. Yorkshire Local Section at Town Hall, Leeds. Chairman's address, "Canals," by Sir John Eaglesome, K.C.M.G.

Saturday, October 10th.—North-Eastern Local Section, at Town Hall, Newcastle-on-Tyne. Paper, "Electric and Petrol Transport of Passengers in America," by Walter Jackson.

Friday, October 16th.—North-Western Local Section, at Midland Hotel, Manchester. Paper, "Electrically-propelled Vehicles for Road Transport," by F. Ayton.

Tuesday, October 20th.—Lecture for Graduates and Students at Institution of Electrical Engineers, London. "Electric and Petrol Transport of Passengers in America," by Walter Jackson.

At the meeting on October 5th, Sir Lynden Macassey will present the premium awards in respect of the 1924-25 Session.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

At the meeting of the Hackney Borough Council on Wednesday of last week, Mr. Alfred Charles Bostel, sales engineer to the Croydon Electricity Supply Department, was appointed to the position of sales manager in the Borough Electricity Department. Of the twenty-eight applicants, three were asked to appear before the Council for the purpose of final selection. Before the applicants were introduced in the Council Chamber, Alderman Morrison asked that the Council be informed as to the number of marks gained by each candidate at the examination. Councillor Langton said that the disclosure was not desirable, also that an examination was not the only criterion of the right man, there were other qualifications to be considered. Alderman Morrison said he was not going to vote for a man on his appearance, he had a public duty to perform, there must have been an order of merit and he moved that the Council go into committee to consider the matter; he was of the opinion that there was something "going on." The motion was lost and the choice made as stated above. Alderman Morrison did not vote.

At a recent meeting of the Walsall Town Council, a recommendation of the Electric Supply Committee to increase the salary of the manager of the undertaking (Mr. H. A. Howie) from £810 to £900 per annum was carried.

M. Alexis E. Duvaux, general director of the Compagnie Générale d'Electricité, of Paris, has been recently appointed a Chevalier of the Légion d'Honneur.

Lieut.-Col. F. V. Willey, the president of the Federation of British Industries, sailed in the *Aquitania* last week for New York. He is to stay in the United States for a month, thereafter visiting Canada.

Mr. L. Marshall Jockel has been appointed station superintendent, not boiler-house superintendent, at North Wilford power station, as stated in the Electrical Reriew for September 18th, p. 468. Mr. D. H. Brown, A.M.I.E.E., is the boiler-house superintendent.

Mr. W. A. Sycamore, who recently resigned his position as London manager of the Keighley Gas and Oil Engine Co., has joined Vickers-Petters, Ltd., and will be attached to their London office, 75b, Queen Victoria Street, E.C.4.

Mr. T. T. D. Geesin, who was appointed general manager of Messrs. Walter Gee & Son, Ltd., engineers, Paisley, in February last, has now been appointed to a seat on the board of directors.

Mr. S. E. Povey, formerly resident engineer at the Formby power station of the L.M.S. Railway Co., is shortly leaving this country to take up a position at Bombay.

Mr. Percy H. Naftel, A.M.I.E.E., who has just retired from the position of installation engineer of the Liverpool Corporation Electric Supply Department, entertained his staff to a complimentary dinner at which he was presented with a silver cigar casket. His successor is Mr. Samuel Lowey, who commenced his employment with the department in November, 1900.

Mr. S. Hann, borough electrical engineer, Stoke Newington, has been in poor health for some time past. The Electricity Committee reports that it has granted him four months' leave of absence, dating from July 13th, as recommended by his medical adviser.

Mr. A. H. Pott, consulting engineer, is removing on September 28th from Bishopsgate to 150, Dashwood House, Old Broad Street, E.C.2. 'Phone No.: "London Wall 4310."

According to Sydney newspapers just to hand it is likely that Mr. Forbes Mackay, the general manager of the Sydney City Council's electricity department, will leave for London shortly in connection with arrangements for the purchase of the equipment for the new power station. The Sydney *Sun* hints at the possibility of his being retained in London as the Council's representative, heavy consulting and inspecting fees being saved in consequence. Whether Mr. Mackay will stay here for one or for two years is not clear, but it is remarked that while he is away from Sydney the power house will be built by the Council's engineers in consultation with Mr. H. E. White, a well-known city architect and engineer.

Mr. J. H. Rider, whose portrait is reproduced herewith, was born at Bristol in 1864, and served his engineering apprenticeship with the firm of Paterson & Cooper, of Dalston; in 1887 he became electrical engineer to another well-known pioneering firm—Blakey, Emmott & Co., Ltd., of Halifax—but six years later he turned his attention to the supply side of the industry, being appointed borough electrical engineer by the Bolton Corporation. From 1896 to 1901 Mr. Rider occupied a similar position at Plymouth, where he designed and built a new power station. His next appointment was that of electrical engineer to the London County Council Tramways, which position he retained until 1910, when he went to South Africa as consulting electrical and mechanical engineer to the Central Mining & Investment Corporation, Ltd., of Johannesburg. In 1915 he returned to this country and became a partner in the firm of Preece, Cardew & Rider, consulting engineers, London. Mr. Rider is a member of the Institutions of Civil Engineers and Mechanical Engineers, and a past vice-president of the Institution of Electrical Engineers; he is also a past-president of the South African Institute of Electrical Engineers, and of the Incorporated Municipal Electrical Association. In 1909 he read a paper on "The Electrical System of the L.C.C. Tramways," for which he was awarded the Willans premium and the Institution premium of the I.E.E.; and in 1915 for his I.E.E. paper on "The Power Supply of the Central Mining—Rand Mines Group," he was awarded the Ayrton premium. In the course of his long professional career he has advised 36 municipal corporations and companies on questions relating to electricity supply, and he is well known as an expert engineering witness before Parliamentary Committees, at local inquiries, &c. One of his most recent achievements was the design and construction of the super-power station of the Nottingham Corporation at North Wilford, a description of which is concluded in this issue.

Mr. J. H. Rider, M.Inst.C.E., M.I.E.E.,
Consulting Electrical Engineer.

Obituary.—Herr C. Schwennicke.—The death is reported from Berlin of Herr Carl Schwennicke, who was with the Siemens & Halske Co. for 50 years. The deceased, who was 86 years of age and was well-known in connection with telegraphy, electrical signalling, and electrical measurement, was a co-worker with the late Werner Siemens.

Mr. A. W. Gattie.—We regret to record the death at the age of 69 years of Mr. Alfred Warwick Gattie, the inventor of the railway clearing house traffic scheme for London which was publicly discussed several years ago and was reported adversely upon by a Departmental Committee.

Mr. G. McCluskey.—The death occurred on September 16th of Mr. George McCluskey, for many years outside electrical engineering manager to Messrs. J. H. Holmes & Co., Newcastle.

New Companies Registered.

Koda (London), Ltd. (208,414).—Private company. Registered September 15th. Capital, £25,500 in 25,000 3 per cent. cumulative preference shares of £1 and 10,000 ordinary shares of 1s. Objects: To adopt an agreement with G. Weissman to acquire and sell under patents Nos. 14,797, of 1922, 4,813, of 1923, and 463, of 1924, electric cell and battery and other electrical appliances and accessories in Great Britain and Ireland. The provisional directors are:—P. Shepherd, 22, Wellesley Road, Croydon, secretary; C. N. Blackburn, 43, Guildford Avenue, Surbiton Hill, chartered accountant. Qualification, £1. Solicitors: Windsor & Brown, 228, Bishopsgate, E.C.2.

Vaprost, Ltd. (208,428).—Private company. Registered September 16th. Capital, £5,500 in 3,000 10 per cent. cumulative preference and 2,000 ordinary shares of £1 and 10,000 founders' shares of 1s. each. Objects: To carry on the business of manufacturers and letters out on hire of and dealers in generators or any apparatus for the manufacture, generation or supply of gas, electricity, cooking apparatus and accessories, &c. The subscribers (each with one preference share) are:—E. G. Scott, 33/4, Broad Street Avenue, E.C.2, solicitor; L. C. Crick, 33/4, Broad Street Avenue, E.C.2, articled clerk. The first directors are to be appointed by the subscribers. Qualification, £100 shares. Remuneration, £100 each per annum (chairman, £50 extra). Solicitor: E. G. Scott, 33/4, Broad Street Avenue, E.C.2.

Blackadda Radio Co., Ltd. (208,465).—Private company. Registered September 18th. Capital, £3,000 in £1 shares. Objects:—To acquire the invention and letters patent No. 185,180 of 1921 for improvements in standardised and interchangeable component parts for construction of wireless apparatus, &c. The subscribers (each with one share) are:—C. A. Newton, Park Lane House, Littleover, Derby, electrical engineer; F. Newton, Weston Bank, Rodbourne Street, Derby, engineer. C. A. Newton is the first managing director and chairman. Qualification, 100 shares. Remuneration as fixed by the company. Secretary: F. Bond. Solicitors: Robotham and Co., 3, St. Mary's Gate, Derby.

Beaver Accumulator Co., Ltd. (208,463).—Private company. Registered September 18th. Capital, £100 in £1 shares. Objects:—To carry on the business of manufacturers of, agents for, and dealers in accumulators, electric batteries and parts and accessories therefor, wireless instruments, &c. The directors are:—C. Manning, 80, Wigmore Street, W.1; J. K. Nethercoate, "Umgeni," Wimborne Road, Bournemouth; G. Laird, 190, Lauderdale Mansions, Maida Vale, W.1. Qualification, 1 share. Solicitors: Horner & Horner, Fitzalan House, Arundel Street, W.C.2.

Official Returns of Electrical Companies.

Yeovil Electric Light and Power Co., Ltd. (186,456).—Return dated May 25th, 1925. Capital, £10,000 in £1 shares. All shares taken up. £10,000 paid. Mortgages and charges, nil.

Sennybridge Electric Supply Co., Ltd. (174,920).—Return dated June 30th, 1924 (filed April 18th, 1925). Capital, £1,500 in £25 shares. 48 shares taken up. £1,200 paid. Mortgages and charges, nil.

Lamp Caps, Ltd. (185,691).—Return dated July 24th, 1925. Capital, £50,000 in £1 shares. 12,000 shares taken up. £12,000 paid. Mortgages and charges, nil.

Witton-James, Ltd. (110,693).—Return dated July 27th, 1925. Capital, £6,100 in 2,000 preference and 4,000 ordinary shares of £1 each and 2,000 deferred shares of 1s. each. All shares taken up. £2,000 paid on 2,000 preference shares. £4,100 considered as paid on 4,000 ordinary and 2,000 deferred shares. Mortgages and charges at date of return, nil. Particulars filed of £25,000 debentures authorised September 1st, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

London Electric Stores, Ltd. (185,651).—Return dated February 22nd, 1924 (filed February 14th, 1925). Capital, £1,000 in £1 shares. 750 shares taken up. £750 considered as paid. Mortgages and charges, nil.

Marshall Electrical Co., Ltd. (185,795).—Return dated March 6th, 1925. Capital, £3,000 in 2,300 preference and 700 ordinary shares of £1 each. 2,300 preference and 682 ordinary shares taken up. £2,300 paid. £682 considered as paid. Mortgages and charges, nil.

R. F. Winder, Ltd.—Particulars filed of £5,000 debentures authorised June 26th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Elco Electric Manufacturing Co., Ltd.—J. P. Emett, of 18, St. Nicholas Street, Bristol, ceased to act as receiver or manager on August 14th, 1925.

Santon, Ltd.—Mortgage on 34, Bridge Street, Newport, Mon., dated August 27th, 1925, to secure all moneys due or to become due from the company to Lloyd's Bank, Ltd., not exceeding £1,400.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

International Telephone and Telegraph Corporation.—100,000 new shares of $100 each issued at par, partly paid and fully paid. Fractional warrants to bearer.

Application has been made to the Committee to allow the following to be quoted officially:—

Ever-Ready Co. (Great Britain).—249,000 ordinary shares of £1 each, fully paid, Nos. 200,001 to 449,000, and 165,892 7 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 165,892.

The undermentioned have been ordered to be officially quoted:—

Shropshire, Worcestershire and Staffordshire Electric Power Co.—117,375 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 350,001 to 450,000, and 1,100,001 to 1,127,375.

Havana Electric Railway, Light and Power Co.—A plan for the readjustment of the share capitalisation of the company through the exchange of existing stock for the stock of the Havana Electric & Utilities Company has been formulated by Speyer & Co., of New York. Stockholders of the Havana Electric Railway, Light and Power Co., are offered the right of exchanging their stock for stock of the Havana Electric and Utilities Co. and cash.

Quebec Power Co.—Dividends of $1½ per share on the common shares and $1¾ per share on the preferred shares have been declared in respect of the quarter ending September 30th.

J. G. White & Co., Ltd.—The directors announce, states the *Financial Times*, that in view of certain important negotiations which are proceeding and may materially affect the position of the company, they consider that it will be in the best interests of the shareholders to postpone the presentation of the accounts and balance-sheet for the year ended February 28th last. A formal meeting will be held to-day (September 25th) to comply with the requirements of the Companies Acts.

Shawinigan Water and Power Co.—The company has declared a dividend of $2 per share on the common shares for the quarter ending September 30th.

The directors have authorised the issue of $1,279,800 of common stock; it is offered to existing stockholders in the proportion of one new share to every 20 held.

Kaministiquia Power Co.—The company has received an offer for the sale of its undertaking to the Fort William Paper Co. The consideration is the payment of $145 per share—$95 in cash and $50 in 7½ per cent. cumulative preferred stock in a new power company to be formed. The offer is subject to the redemption of the Kaministiquia Co.'s first mortgage bonds.

International Telephone and Telegraph Corporation.—The stockholders of the Corporation have approved of the proposals to increase the company's capital to 100 million dollars and to purchase the Western Electric Company.—*Financial Times.*

Italian Company.—*The Terni Steel, Iron and Electrical Co.*—It has been decided to raise the capital of this company from 350 to 600 million lire.

Northern General Transport Co., Ltd.—An interim dividend of 2½ per cent. has been declared on the ordinary shares, as in 1924.

P. & W. Maclellan, Ltd.—An interim dividend at the rate of 6 per cent. has been declared on the 6 per cent. cumulative preference shares for the six months ended June 30th last.

Folkestone Electricity Supply Co., Ltd.—The ordinary shares are to receive a dividend at the rate of 8 per cent. per annum, free of tax, for the past half year.

Electric Supply Corporation, Ltd.—A dividend at the rate of 8 per cent. per annum, less tax, has been declared in respect of the past half year.

German Company.—*Lloyd Dynamo Works Co.*, Bremen.—The board proposes to increase the company's capital by the issue of preference shares to the value of 1,200,000 marks.

Bruce Peebles & Co., Ltd.—The directors have declared the dividend on the 7½ per cent. cumulative participating preference shares in respect of the first half of the current year.

County of London Electric Supply Co., Ltd.—The directors announce that the outstanding 5½ per cent. one-year notes are to be repaid at par on and after September 30th.

Hoffman Manufacturing Co., Ltd.—An interim dividend of 4 per cent., free of tax, has been declared on the ordinary shares for the six months ended June 30th last.

Parker, Winder & Achurch, Ltd.—A dividend at the rate of 5 per cent. per annum has been declared on the ordinary shares for the first half of the current year.

Howard & Bullough, Ltd.—A quarterly dividend of 6d. per share, less tax, has been declared on the ordinary shares.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange expectation looks forward hopefully to a fall in the Bank Rate to 4 per cent. this week. If the reduction should not be made on Thursday, there will be mild disappointment, though, doubtless, the anticipation will simply be carried over for another week. Money stocks, however, are influenced by the ease that prevails in banking circles. There is substantial buying in progress of all first-class investment securities, and the effect of this is seen in a strengthening of sound investment issues of various kinds. The labour and industrial position continues to be unsatisfactory. Further falls in Home Railway stocks witness to the uneasiness of proprietors of these investments. Money realised by the sale of Home Rails is being diverted into Industrials, and in the market for the latter, noticeable activity prevails. The feature for the moment is the strength of rubber shares, in consequence of the firmness displayed by the price of the product. This latter factor lays a hand of restraint upon the buoyancy of shares in the cable construction and similar concerns, the prices of which, after their recent material advances, have shown a tendency to react.

The electricity supply market is steady, changes being few and far between. St. James's are again the outstanding feature of strength, with another rise of 5s., this taking the price

to 14¾. The shares are amongst the very few of the £5 denomination that remain in the London list, Kensingtons being the other best-known example. Lancashire Light & Power shares are easier at 26s.; otherwise, the provincial group is unchanged. The Folkestone Electricity Supply Company has declared an interim dividend of 8 per cent. per annum tax free payable on October 1st. The price of the shares is £2 middle, at which a few bargains have recently been transacted. Last year the dividend was the same, 10 per cent. tax-free being paid for the full period of twelve months. Folkestone 5 per cent. preference stand about 17s. 6d., but have not changed hands for six months. An important extension of electrical supply came into operation last week, when the Nottingham Corporation opened a new super-power generating station. This proposes to supply the city and district, and also to form a link in the general scheme of the East Midlands supply, connecting Leicester, Derby and other centres. The Midland Electric Corporation for Power Distribution is going to pay an interim dividend of 5 per cent. actual. The ordinary shares stand at 2⅝ and the 7 per cent. preference at 25s.

The County of London Electric Supply Company announces that its outstanding 5½ per cent. one-year notes to bearer will be repaid at 100 on Wednesday, September 30th. It may be recalled that the issue of 1½ million pounds was readily subscribed by the shareholders at 99¾ last August. There has always been a market in the notes, although, owing to their short-dated character, they were suitable, of course, only for investors who required something that was in the nature of a gilt-edged bill.

The Home Railway flatness extended into the Underground section, causing falls in Metropolitans, Districts and the three classes of the Underground Electric Railways. A campaign is on foot for the attempted restoration of confidence in Home Railway stocks, attention being called to the overdone nature of the fall in prices. This has had some slender effect in rallying quotations from the worst, but there is no escaping from the obvious fact that investment is afraid of Home Rails owing to trading and labour conditions, coupled with which is the animation shown by many Industrials, which come into sharp competition with the stocks in the senior market.

Brazilian Tractions are again amongst the liveliest stocks in the house. Momentarily the price touched 76½, but this brought in sellers, and the Tractions subsided to 75. It is hinted that more than an expectation of an increased dividend lies at the back of the recent heavy buying, and some people in close touch with Montreal surmise that there may be buying that has for its object the obtaining of control of the company. Amongst other foreign issues, Tokio Electric Sixes are dull at 89, in consequence of the latest fire that has occurred in the Japanese city. Indian electrical issues are also inclined to be heavy, Tata Power 7½ per cent. "B" debenture changing hands the other day at 92. River Plate Electricity ordinary came to market at 202. Most of the dollar stocks are strong, Pennsylvania Water and Power capital stock, for instance, showing a rise of 10 points at 165. The Shawinigan Water and Power Company is about to make an offer of common stock at par on the basis of one share for each 20 shares now held. The whole of the money will be called up at once. As the price of the existing shares stands at 167½, the value of the rights is substantial.

The Electric Supply Corporation has declared an interim dividend at the rate of 8 per cent. per annum, less tax, the same as that of a year ago, and the price of the shares remains at 31s. 3d. Electric Constructions are better at 32s., showing a gain of 1s. 6d., and British Aluminium recovered to 1¾.

Cable manufacturing shares, as already noticed, are slightly easier, for which the rise in the price of raw rubber is again assigned as the reason. Siemens at 29s. 6d., India Rubber at 21s. 3d., Johnson & Phillips at 48s. 9d., and Callenders at 3¼ are all a trifle lower. General Electrics and Henleys have not moved. British Electric Transformer Preference strengthened to their par price of 20s. Babcocks are steady at 2½, though the iron and steel group is disposed to yield ground in consequence of the depression prevailing in trade circles.

Amongst cable stocks and shares, the Eastern group remains placid, Eastern ordinary, with a point decline, being the only member to exhibit any change. Indo-Europeans are £1 higher. Great Northerns strengthened to 32¾, part of the demand being attributed to Copenhagen. Direct Spanish remain at 9; the interim dividend is again to be 4 per cent., free of tax. The company's 10 per cent. preference are quoted at 7½; both classes are of £5 each. United River Plate Telephones have gone back a trifle.

Marconis hold their rise to 28s. 9d. Main interest in wireless shares is transferred, for the time being, to Canadian Marconis. The price of these has gone up to 6s. 3d., and is being industriously "talked" still better. Marconi debenture rose to 104. The wireless market has come to life again; it is showing more vitality than it has done for months past. But the liveliest section amongst industrials is that devoted to rubber shares. There, the business at present afoot is, to quote one broker's statement, absurdly enormous.

Exports and Imports of Electrical Goods and Machinery in August, 1925.

Why the Exports Fell.

In making a study of last month's foreign trade statistics, two or three points have to be borne in mind if a true impression is to be gained. In the first place, the August Bank Holiday period naturally affected the whole of industry; then, in addition, numerous firms, particularly in the North and Midlands, were shut down for a week or more. Another thing which made an appreciable difference was the incidence of five week-ends (Saturdays and Sundays). With these facts in view, the reduction of about 5.8 per cent. which occurred in the general export total as compared with July is seen to be less than one might reasonably have expected. The exports of electrical goods in particular were in actual fact very little lower than in July if the foregoing considerations are taken into account, and when compared with the general export trade the position is seen to be favourable; the decline only amountd to about 2.5 per cent.

Probably the real criterion is August, 1924; when last month's total is put against the figure for that month, an increase of £77,872 is to be observed. While as regards the individual items in the export list, the reductions predominated, there were also one or two large increases. The principal decline, both in actual value and proportionately, occurred in the case of insulated wires and cables, which showed a fall of over 30 per cent. The only other notable decreases were shown by unenumerated electrical goods and apparatus, and telegraph and telephone instruments and apparatus. The increases included a rise of £54,895, or over 27 per cent., in the value of unenumerated electrical machinery; one of £14,491 (71 per cent.) in meters and instruments; and one of £12,313 (32 per cent.) in glow lamps. The chief increases as compared with August, 1924, occurred in the cases of glow lamps, batteries and accumulators, unenumerated electrical machinery, railway and tramway motors, and submarine telegraph and telephone cable. The only important decreases occurred in the items insulated wires and cables and non-submarine telegraph and telephone wires and cable.

The import list is a tale of increases as compared with the previous month's figures and also in comparison with those of August, 1924. Thus, the increase in the total is well distributed, only two items reaching above the £10,000 mark, *viz.*, batteries and accumulators and unenumerated electrical machinery. The only two decreases occurred in the items meters and instruments, and switchboards (not telegraph or telephone).

In the re-export section, which is not of very large dimensions, there was a drastic reduction, the July total being almost halved, although the figure was not far below the August, 1924, total. The reduction was general, although three increases occurred, the most important one being connected with glow lamps.

It will be observed that the increases in all three sections for the first eight months of the year are in the neighbourhood of twice the August totals, the export increase being rather less than this amount. The actual increase in the value of exports as compared with the first eight months of 1924 is 20 per cent.

Electricity Supply in Germany.—Herr W. Majerczik, of Charlottenburg, is advocating the introduction of a uniform system of production and distribution of energy by the Reich Government, as he says that only under such a system will it be possible to get a cheap supply of energy. Not only Prussia, but also the States of Bavaria, Wurtemberg, Baden, Saxony and Thuringia, in recent years have begun to develop the production and distribution of energy, while various provinces, such as Brandenburg, Pomerania, and East Prussia, have also embarked on the same path, and to these have to be added the numerous communal works both of a private nature and those under joint proprietorship. An electrical map of the present time is said to resemble the political map of the Middle Ages, when there were hundreds of large and small States, for there are now thousands of supply undertakings with areas overlapping one another. It is argued that out of this state of chaos it is necessary to bring order, and apart from about a dozen of the largest towns all the other works should be consolidated under a uniform Reich undertaking.

Canadian Electrical Notes.

(By Our Special Correspondent.)

THE Provincial Government of Ontario has recently publishe a pamphlet bearing the title "List of Water Powers in th Province of Ontario." The greater part of this pamphlet co sists of a tabulation giving the names of the various rivers c which power is available; the district in which the draina area lies; the actual power sites; the available head in feet; th estimated capacity in horse-power at 80 per cent. efficienc both at ordinary minimum flow and at ordinary six month flow, and the present installed horse-power, if any. For th last three items the totals are given for each individual river

In the foreword it is pointed out that "High accuracy the estimate of water power requires continuous stream flo records over a long period of time, and as such long-ter records are available for only comparatively few of the rive of the Province, many of the estimates are subject to revisi as more is learned of the run-off characteristics. Nevertheles the estimates will give a fairly close approximation of th power possibilities of the Province and serve as a starting poi for the more detailed study of individual sites."

In the introductory text preceding the tabulation referred above, the following table is given:—

TABLE I.—AVAILABLE AND INSTALLED WATER POWER IN ONTARI

Drainage Basin.	Estimated Capacity in H.P. at 80% efficiency. At ordinary minimum flow.	At ordinary six-months' flow.	Installed H.P.
Hudson Bay ...	26,759	53,513	—
James Bay	525,862	950,982	117,085
Lake Winnipeg ...	199,944	328,696	36,645
Lake Superior ...	180,787	303,822	90,600
Lake Huron	221,502	413,000	168,993
Lake Erie	3,292	8,923	11,367
Lake Ontario ...	1,054,935	1,101,060	1,030,705
St. Lawrence River	791,308	956,561	17,671
Ottawa River ...	423,763	708,986	112,267
Totals	3,429,152	4,825,143	1,585,333

It is stated that the totals of available power shown abo "include only the amount of power in the Niagara Riv which is equivalent to the diversion of water permitted treaty." There is little doubt that before long application w be made to Ottawa and Washington respectively for permissi to divert considerably more water for power purposes from t Niagara River than is allowed by the present treaty. If t total power possibilities of the Niagara River were made ava able for development, the provincial totals would rise to so 5,330,000 h.p. at ordinary minimum flow and 6,940,000 h.p. ordinary six-months' flow. That there is plenty of scope the installation of hydro-electric plant in Ontario yet may seen from the statement that studies have indicated th throughout Canada generally installed power is about 30 cent. greater than the corresponding six-months' power. this basis, therefore, the water-power resources of Onta would permit of an installation of 6,270,000 h.p. or, if the to potential power of the Niagara River is included, an installati of 9,000,000 h.p. The water-power resources of the Provi may thus be said to be from 18 to 25 per cent. developed. T estimated water powers are in all cases on the basis of c tinuous twenty-four-hour power.

There is no doubt that owing to some of the water powers Ontario being situated in uninhabited, and in some cases cidedly inhospitable, regions, it will be long before all of th are utilised, but fortunately a very considerable proportion the available power is located in the St. Lawrence and Otta River basins and on Lake Ontario, where use can be m of it as the need arises.

There has recently been developed in Canada a new elect furnace process for the manufacture of sodium sulphide, paper on which subject was read at the Dominion Conventi of Chemists which was held at the beginning of June. T paper is reported in full in *Canadian Chemistry and Met lurgy*, but, unfortunately, no electrical data whatever given. The account is very interesting, however, as anot instance of the industrial application of electricity. Canada Carbide Company is now advertising sodium sulph of a purity of 85 per cent., which is much higher than attainable by former processes, and in the development of t process some extraordinary difficulties had to be overcome the substance is liquid at a relatively low temperature but s and extremely refractory at higher temperatures (*i.e.*, ab 1,000 deg. C.). At the lower temperature it was not possi to obtain the substance above about 60 per cent. purity. research leading up to the development of the process o commercial basis was carried out under the auspices of (Canadian) Honorary Council for Scientific and Indust Research. The manufacturing development was undertal by the Canada Carbide Company at Shawinigan Falls. Sodi sulphide is largely used as a solvent for sulphur dyes; i employed as a depilatory for hides and as a sheep dip; an has other minor uses such as in the precipitation of silver the regeneration of cyanide in mining operations.

The Wireless Exhibition, 1925.

An All-British Display of Radio-Telephone Apparatus and Accessories.

(*Continued from page* 450.)

British L. M. Ericsson Manufacturing Co., Ltd.

In addition to numerous examples of its well-known telephones and loud-speakers, this company displayed a number of receiving sets. One of these, a miniature crystal set, is illustrated in fig. 11. As will be seen, this is of an extremely compact nature, and it is only about two inches in diameter. The rectangular knob on the left is for the adjustment of the crystal, while the centre knob bears the cat's-whisker. The tuning knob on the right-hand side of the set operates a slider upon a tapped inductance. The aerial and earth terminals are diametrically opposite on the side of the case. A four-valve set (fig. 12) was shown in various combinations

Fig. 11.—The Ericsson Miniature Crystal Set.

enclosed panel and cabinet forms). This has a tuned anode circuit and two power valves. Each valve is provided with a dual filament resistance to enable either bright or dull emitters to be employed. A wave-trap is incorporated, but this is easily disconnected when not required. A switching arrangement to permit of the use of two, three, or four valves is provided.

Fig. 12.—An Ericsson 4-Valve Set.

A notable feature of these four-valve sets is that the panel is of wood—oak, mahogany, or walnut. This is quite as suitable as ebonite if, as in these sets, the spindle holes are bushed with good insulating material. One of the cabinets shown was an excellent piece of workmanship and incorporated every convenience for radio work. The exhibit also included numerous components.

Edison Swan Electric Co., Ltd.

Being a valve manufacturer, the company has added to its series since the last exhibition, and amongst the bright types one "A.R." is specially made for h.f. and l.f. work, the distinguishing marking being a red or green lines respectively along the bulb from the cap to the tip. Another interesting point about the company's valves is the new method of sealing which ensures that the purchaser receives an absolutely new valve; the device consists of a glass tube fitted over the anode pin, to which it is attached by means of a sealed thread. Amongst the array of Ediswan sets and components we were interested in a new two-valve receiver (fig. 13) which the company is just placing on the market. Its circuit consists of a detector and one l.f. stage with reaction and it is claimed that excellent loud speaker results are obtained up to 25 miles and with headphones stations over 100 miles away are received well. The set is of a circular pattern in moulded insulating material, the valves being mounted close together on a central raised pillar, the l.f. transformer and connections being inside the pillar. All controls are arranged radially from the central pillar, a flat type condenser being contained in the base; the filament is arranged for dual control so that either bright or dull emitter valves may be used, and the coils are of the plug-in type. Another interesting item is the intermediate stage coupler for super-heterodyne circuits. It contains the coupling

Fig. 13.—Circular Ediswan 2-valve Receiver.

transformers and a filter circuit, suitably spaced and mounted on a common spindle, all connections being made to terminals on the two longest edges of the base. The long-range radiophone is a four-valve set of the reflex type, and sets finished in a variety of styles in Chinese lacquer are shown with support-

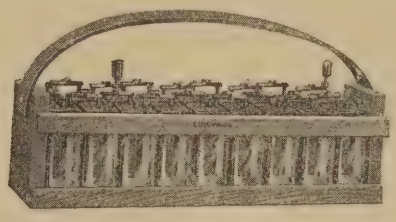

Fig. 14.—New Ediswan H.P. Accumulator.

ing tables and loud speakers to match. The company has introduced a high-pressure accumulator (fig. 14), the units of which have been specially designed for the purpose. Other exhibits were dry h.p. batteries, dry batteries for use with dull-emitter valves, and headphones.

C. A. Vandervell & Co., Ltd.

This display stand consisted chiefly of components. The whole of the movement of the "C.A.V." crystal detector was shown mounted in a moulded circular base 1⅞ in. in diameter and enclosed in a glass case 2¼ in. high. A hornless type of loud

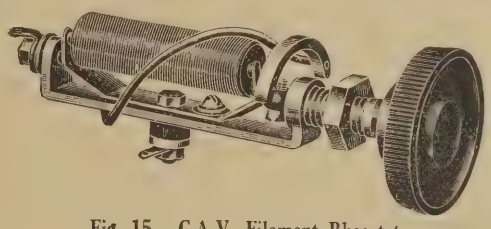

Fig. 15.—C.A.V. Filament Rheostat.

speaker has been designed for those requiring an instrument to harmonise with the furnishings of a room. It is encased in a polished mahogany cabinet measuring only 15½ in. long, 9¼ in. wide and 9 in. high. The filament resistance, fig. 15, is of an unconventional type; it is mounted on spring sup-

Fig. 16.—C.A.V. Multiple Fixed Condenser.

ports, its length behind the panel being 3 in., and the resistance is made to revolve with the rotating helical contactor. An interesting multiple fixed condenser is shown in fig. 16; by combining several condensers in one case, with convenient

tapping points, it is possible to obtain any required capacity value within the stated limits by simply connecting the tappings in parallel. The component is totally enclosed in an ebonite casing, and screened from stray capacity effects; its overall height is 2¼ in. and length 2¾ in. Attention has been paid to the production of a tuning inductance which combines mechanical strength, small losses, and a pleasing appearance. C.A.V. tuning coils, fig. 17, for the broadcast range, are wound with bare copper wire, 22 s.w.g., air spaced on special formers, and are protected by a strong casing. As a further refinement, the block carrying the plug and socket is cut away to reduce the capacity between the metal portions, and all the coils are 4 in. in diameter by 1 in. wide. The company's valve holder sockets are constructed of helical springs kept at the correct tension by means of an absorbent cushion ring which method ensures contact and prevents the transmis-

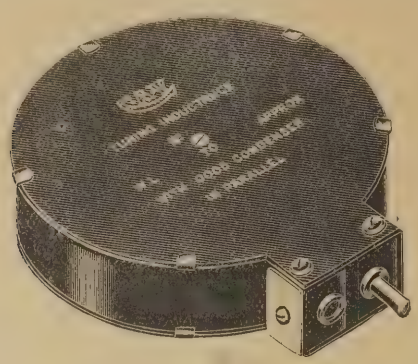

Fig. 17. C.A.V. Tuning Coil.

sion of vibration or shock to the valve. The moulded casing is slotted between the metal portion in order to reduce inter-socket capacity. A gramophone attachment, various patterns of transformers, and h.p. and l.p accumulators, were also on view, including a combined set, the assembly of which comprises two separately crated H.T.2 sets, giving a total of 120 volts, and a 6-E.L.5, 6-volt, 50-amp.-hr. (actual) l.p. ebonite accumulator, all encased in a polished rosewood container. The specially shaped hinged lid exposes the plates of front cells to view and permits easy inspection of all connections. Valve protection is afforded by a fused connecting link between the two h.p. groups, which also serves for testing each two-volt cell. Feed wires enter the back of the container, the dimensions of which are 25 in. by 13 in. by 8½ in. in height, handles and clips projecting.

Sun Electrical Co., Ltd.

Upon this stand were displayed examples of the products of numerous radio apparatus manufacturers. Receiving sets of the leading makes were shown in great variety, one of the principal being an "Acme" 7-valve super-heterodyne receiver with a single-knob control. All kinds of components were exhibited, and the accessories included a wide range of loud speakers, telephones, valves, and batteries.

Alfred Graham & Co.

The well-known "Amplion" products were shown in the centre of the main hall, and as last year demonstrations were given "under home conditions" at a special depôt in Kensington Palace Mansions near by, representative ranges of loud-speaker models being on view at both places, including the "Dragon" and "Junior" types. Recent constructional improvements were described in our pages last month.

A notable innovation, first shown at the Exhibition, was the new series of "Radiolux Amplions." The "Radiolux" is

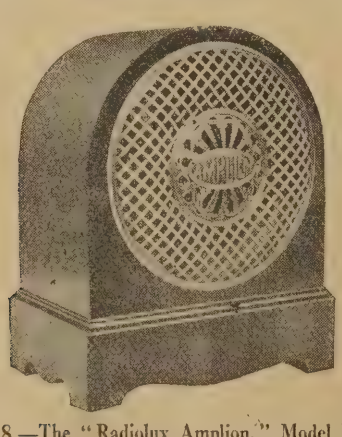

Fig. 18.—The "Radiolux Amplion," Model RS20.

an apparently hornless cabinet loud-speaker, of which one pattern is illustrated in fig. 18 herewith; it somewhat resembles a bracket clock in shape and size, and is made in two patterns, with five cabinet styles, all of very handsome appearance. In place of the usual horn, there is an acoustic duct, bent as shown in figs. 19 and 20, so as to occupy the minimum space, and passing through the wall of a reflecting bowl; the mouth of the duct faces the specially shaped bottom of the bowl, which has a flaring mouth (fig. 20). The electromagnetic system has a threaded nozzle, which screws into a rubber brush in the small end of the duct below a perforated supporting plate; the plate and the whole of the acoustic system are insulated from the cabinet by rubber washers, and every care is

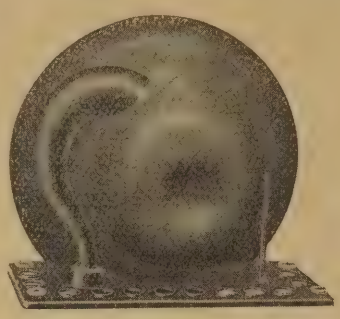

Fig. 19.—Acoustic System from the Rear.

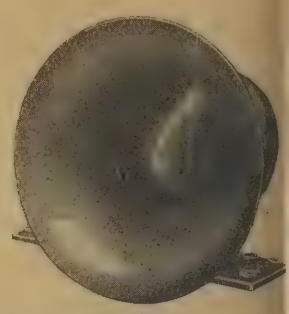

Fig. 20.—Front View of Bowl.

taken to avoid the presence of unwanted resonance. The electromagnetic system is of new design, the rear plate carrying the whole of the mechanism, the adjusting device, and the terminals, which are of a patented spring type. The grille seen in fig. 18 is bulged, for acoustic reasons, and the effect is very pleasing. It is claimed that the new type gives great volume of sound with purity of tone and absence of objectionable resonance.

The new "Swan-Neck" type of Amplion was also exhibited.

Metro-Vick Supplies, Ltd.

Among a number of receiving sets shown by this company was a new 3-valve set of very novel construction. This departs entirely from the usual lines, and in this way becomes a set of small dimensions. Resistance-capacity coupling is employed; this, it is claimed, ensures distortionless amplification of speech and music. The operation of the set is simplified by its only having two controls—a main tuning condenser with vernier adjustment and a variable reactance coil. A dual rheostat, a battery switch, and spring valve holders are incorporated. The coil units cover wavelength ranges of from 230 to 550 metres and from 1,300 to 3,000 metres with an average aerial. The two control knobs are so arranged that by half a turn contact is broken—thus the set can be left ready for operation at any time on any particular station without fear that the set will be switched on accidentally. A dust-proof cover of dark red moulded composition can be supplied with this set. The cover has a flat top upon which a loud-speaker can be placed. The compact "Cosmos" crystal set, described in our issue of August 28th (p. 356), was also exhibited. This, it will be remembered, has condenser tuning and arrangements for receiving the high-power station. It can be hung up on a wall if required. Other exhibits were a new low-loss, slow-motion condenser, valves, rheostats, potentiometers, and the "Cosmos" strip inductance coil. The last is put up in a highly-polished moulded casing rendering it impervious to moisture.

Radio Communication Co., Ltd.

A competition was arranged by the Radio Communication Company in connection with a display of window-dressing designs. Two lady artists engaged on the staff of the company arranged 12 alternative displays in a special window, which were changed sufficiently frequently to cover each of the twelve selected displays daily. Those wishing to enter the competition were to place on a form provided for the purpose the twelve displays in what they considered to be their relative order of merit, and those who most nearly selected the order decided by the voting in the competition were to receive prizes of £25, £15, and £10 respectively. The competition was open to all visitors to the Exhibition, whether engaged in the trade or not.

(To be continued.)

Trade with Turkey.—The September *Journal* of the British Chamber of Commerce of Turkey contains an article upon British trade in Turkey. It deals mainly with methods of business, stating that there are four salient points to be borne in mind in dealing with this market, *viz.*, that cheapness, not quality, is required; that the requirements of the market are to be considered instead of the market being offered unsuitable goods; that competition is very great; and that competitors grant credit. A brief summary is given of the methods employed by competitors to secure Turkish business; among these are mentioned personal visits by manufacturers, the appointment of reliable agents, regular visits by travellers, facilities in shipment and delivery, and equal attention to both large and small orders. It is said that although Turkey is at present a small market, the country is developing and likely to become an increasingly good customer for many years to come.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Improved Electric Soldering Iron.

The accompanying illustration, fig. 1, is of an electric soldering iron which is marketed by MESSRS. MAY & PADMORE, LTD., Wharfedale Road, Tyseley, Birmingham. The hot-forged copper point is specially shaped to reach places which are difficult of access, while the overall diameter is such that it easily permits the operator to "get at" the connections. It can be connected to an ordinary lamp socket.

Fig. 1.—The Maymore Soldering Iron.

A Field Mule Pack Radio Set.

MESSRS. STUART TURNER, LTD., 43-47, Market Place, Henley-on-Thames, have recently designed and built for the War Office a special petrol-driven generating set, fig. 2, for mule transport for wireless signalling in the field. The set comprises an air-cooled engine and a direct coupled dynamo mounted on a tubular frame for carriage by a pack mule. The engine is of the twin-cylinder opposed type, air cooled, 1,760 r.p.m. The cylinders are of cast-iron with side-by-side valves and detachable heads. The flywheel acts as a centrifugal fan and is surrounded by an aluminium case conducting the air on to the cylinders to cool them. The crankshaft runs on ball bearings and is machined from the solid. The connecting rods have roller bearing big ends with 18 rollers in each, and the gudgeon pin bushes are of bronze. The pistons are aluminium with three cast-iron rings, the gudgeon pins being of the floating type. The camshaft runs on ball bearings and is driven by a gear wheel; it operates the valves by means of tappets. The magneto is driven at half the engine speed by a gear wheel from the camshaft. The governor and oil pump are operated by a shaft, skew driven off the crankshaft. The carburettor is of the patent Stuart design whereby the correct admixture of air and petrol is obtained at all throttle openings. The petrol tank is fitted with a special valve by which the vent hole in the filler cap is closed when the petrol supply is shut off so that it may be carried in any position. At the same time the petrol is not turned on until the vent hole is open. The silencer receives the exhaust from both cylinders and is fitted with an exit pipe to which can easily be attached a flexible exhaust pipe for conveying the exhaust right away from the set. Starting is effected by a handle operating an epicyclic gear with dogs engaging the end of the crankshaft. The gear gives a 3 to 1 increase for starting. The dynamo, made by Newtons, Derby, is direct driven by a flexible fabric coupling and has two outputs generated simultaneously—1,200 V, .08 A, and 12 V, 8.0 A. The framing is of steel tubing completely covering the outside dimensions of the set to provide some protection whilst carried on the pack animal. The set weighs 84 lb. and its dimensions are, length 2 ft. 7 in., width 1 ft. 6 in., height 1 ft. 3 in.

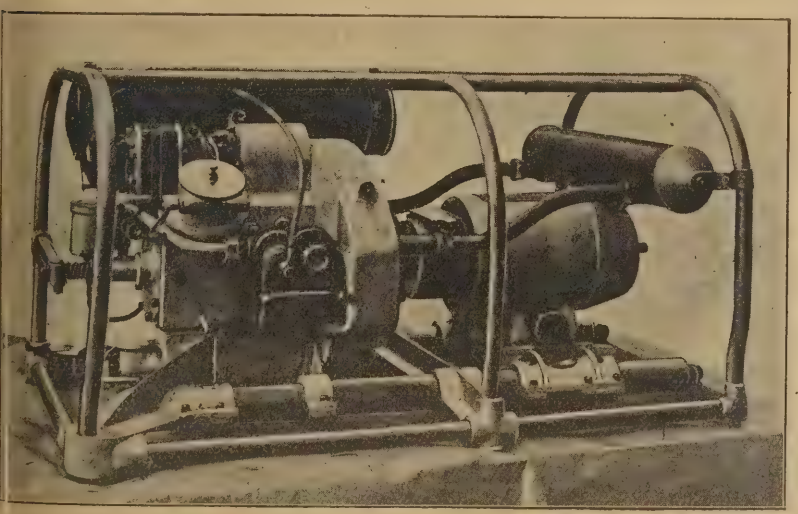

Fig. 2.—The Turner Field Radio Equipment.

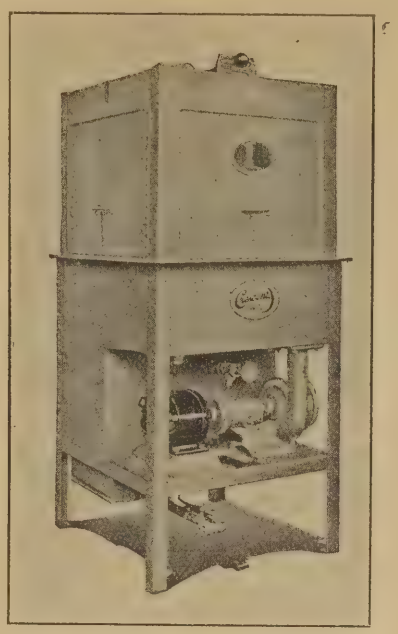
The "Crescent" Dish-washer.

In our recent report on the Bakers' Exhibition at the Agricultural Hall we mentioned that the HOBART MANUFACTURING CO., LTD., Charterhouse Street, E.C.1, included in its display a "Crescent" dish-washing machine. This appliance, which is illustrated in fig 3, contains a rack into which the plates and dishes are inserted. They are then subjected to numerous jets of hot water from a revolving sprayer. After this cleansing operation, water from stationary sprays is projected on to the ware, rinsing it clean. The model illustrated has a height of 56½ in., and it is 27 in. long and 28½ in. wide; it is capable of dealing with from two to three thousand pieces per hour.



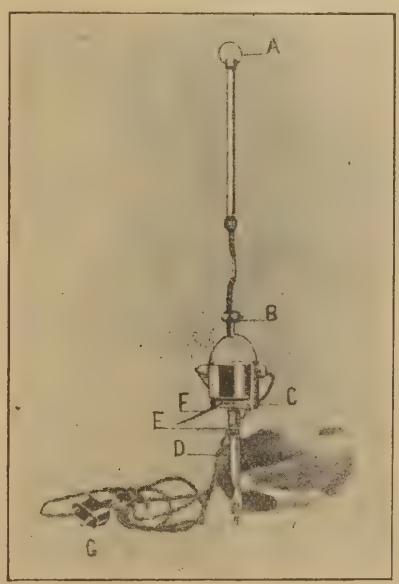


Fig. 3.—The "Crescent" Dish-washer.

An Electric Drawing Copying Machine.

An interesting electrical apparatus by which copies of drawings may be made by perforation on paper, cloth, wood, glass, &c., has recently been put on the market by M. R. LERESCHE, of Vevey, Switzerland. The device (fig. 4) which can be operated from any electric light circuit, comprises an electro-magnet adapted to give an alternating magnetic field so causing a small disk to vibrate, the vibrations being converted into a rapid to and fro motion of a needle which pierces a series of small holes in the drawing to be copied. The original is then placed over another sheet of wood or glass, on which it is desired to produce the copy of the drawing which is done by spreading a special coloured powder over the original; the powder in passing through the perforations giving an exact and sharp copy of the original.

A. Suspension hook.
B. Adjustable support for varying height.
C. Needle working in conjunction with vibrator.
D. Tube adjusting length of perforating needle.
E. Needle adjustment lock nut.
F. Speed regulator.
G. Connection plug to electric circuit.

Fig. 4.—An Electrical Copying Machine.

The Institution of Public Lighting Engineers.

Annual Conference at Leeds.

The second annual conference of the Institution of Public Lighting Engineers took place on September 14th, 15th and 16th at Leeds, and was attended by some 200 members, ladies, and friends directly or indirectly connected with the public lighting profession.

The business meetings were held in the Philosophical Hall, Park Row. On the evening of September 14th, the visitors were entertained to an "At Home" and civic reception at the City Art Gallery by the Rt. Hon. the Lord Mayor of Leeds (Councillor C. G. Gibson) and the Lady Mayoress; afterwards they were conveyed by motor coaches on an hour's tour of the main features of the Leeds lighting system, under the guidance of Mr. C. S. Shapley, Leeds city gas engineer and head of the Street Lighting Department, and various members of the staff. A special feature of the tour was the fact that a considerable number of street sections had been fitted with various manufacturers' lamps and other fittings, both electrical and gas, to show in actual and normal use (not specially-arranged display lighting) appliances which were on view at an exhibition of street-lighting appliances held at the Leeds Town Hall throughout the duration of the Conference.

On September 15th the visitors were entertained to luncheon at the Town Hall as the guests of the Leeds Gas and Lighting Committees, and were subsequently taken on an enjoyable motor drive to Templenewsam and Harrogate. On the Wednesday morning, before resumption of the last business session, a wreath was deposited at the Leeds War Memorial Cenotaph by the newly-elected President of the Institution (Mr. C. S. Shapley, of Leeds), who was accompanied by members of the Council and of the Institution generally.

At the opening of the business on the 15th, the chair was occupied by the retiring president, Mr. S. B. Langlands, Lighting Superintendent of Glasgow, and the members were given an official welcome by the Lord Mayor of Leeds (Councillor C. G. Gibson), who expressed the hope that the Conference would be fruitful of benefit to the profession and through the profession to the public. Mr. Shapley, the president-elect, said the Lord Mayor was to be congratulated on the progress that had been made with public lighting in Leeds.

Mr. C. S. Shapley was then installed in the chair by Mr. Langlands, and Councillor E. J. Clarke, chairman of the Leeds Corporation Street Lighting Committee, in an address couched largely in a humorous vein, added his welcome to that of the Lord Mayor. As a layman, he recognised that lighting engineers performed not only an important public duty, but one the value of which was seldom appreciated by the public as it should be.

Thanks to the retiring President were proposed by his successor, and seconded by Mr. J. F. Colquhoun (Sheffield), both speakers pointing out that Mr. Langlands had borne the brunt of presidential work by taking office in the first and probably the most difficult year. Mr. Langlands, in reply, said he was glad to see evidence of that recognition which was the due of the new Institution in the presence of Mr. R. B. Mitchell, President of the Incorporated Municipal Electrical Association; Mr. C. F. Botley, President of the Institution of Gas Engineers; and other representatives of kindred associations.

The meeting resolved unanimously to send a cablegram of greeting to the Illuminating Society of America which was in conference at the same time.

The President then delivered his address, of which an abstract will be given later.

Commenting on the address, Mr. Shapley said public lighting had immensely improved in recent years, but there was still plenty of room for further improvement. The address was illustrated by a number of lantern slides, showing both electric and gas lighting in Leeds; and by a very large map, erected in a wooden frame across a corner of the room, which when lighted up from behind, with the lights of the room extinguished, was seen to have been punched with holes to represent all the street lamps in the major portion of the Leeds lighting system. The map showed how congested was the population, and the need for adequate lighting, in the industrial aras, and how population became much more sparse some two miles from the centre of the city. The Leeds lighting department, Mr. Shapley pointed out, for a population of some 470,000, had to light 587 miles of streets, which was about sixty miles more than in the case of Glasgow, though the population of Glasgow was much greater. By the pasting of coloured paper behind the map, the electric lighting of Leeds streets was shown by red lights, high-pressure gas by green lights, and low-pressure gas by ordinary white lights. Mr. Shapley spoke of a certain wet roadway and a point policeman who had been nearly knocked down by motorists six times. That policeman was on duty on a well-lighted road, in a white coat. Mr. Shapley made a test and found that, owing to the sheen of the road, the policeman was much better visible, even at night, in his blue uniform than in the white coat. Turning to the question of lamps for marking danger points, Mr. Shapley strongly urged lighting engineers not to overdo the number of these, or they would reduce their value seriously. In consultation with the Chief Constable of Leeds, he had found that in 587 miles of lighted streets and roads there were only 40 points at which a danger lamp was really justifiable. Mr. Shapley asked members to bear in mind that the paper had been written two months before the Conference, and that some points might need a little modification in view of recent lighting developments as seen in the exhibition at the Town Hall.

The thanks of the meeting were accorded to the president for his address, after which Mr. Edward C. Lennox, in order to leave more time for discussion on the next day, read his paper, which was on the programme for the final day, the subject being "Electric Street Lighting in Rural Areas."

Mr. Lennox, like the president, observed that since preparing the paper the development of lighting progress had been such that there were already one or two points on which, if he were writing the paper again, he would make some modifications.

The President proposed a vote of thanks to Mr. Lennox for his paper, and said he had been particularly struck by the excellent design of overhead transmission cabling network, and its neatness.

Councillor H. F. A. Edmonds, vice-chairman of the Camberwell Works Committee, seconded the vote and endorsed the admiration of the neat network.

Mr. C. F. Botley, president of the Institution of Gas Engineers, congratulated the Institution of Public Lighting Engineers on its valuable work in bringing gas and electrical men together to further the common interests of better public lighting. He thanked the Institution for electing as its second president Mr. Shapley, a member of the Council of his own Institution. Many of the points given by Mr. Lennox he could confirm from his own experience. He felt that the reader of the paper was a thorough master of his subject.

Mr. R. B. Mitchell, president of the Incorporated Municipal Electrical Association, said he fully endorsed the remarks of Mr. Botley, and particularly emphasised the value of the two great industries of gas and electricity working together in the public lighting service. He paid a tribute to the excellent address given by the president, and offered his best wishes to the Institution for its future work.

(To be continued.)

The Municipal Tramways Association—II.

Annual Conference at Brighton.

On Thursday, September 10th, Mr. Dalrymple's paper on "Tramway Stopping Places" was discussed, and a paper by Ald. R. A. Smithson, chairman of the Leeds City Tramways Committee, on "Tramway Finance" was read and discussed. In the afternoon the general meeting, reported in our last issue, was held, and in the evening the annual dinner of the Association took place at the Hotel Metropole. Ald. C. Higham presided over a gathering of about 400. Proposing "The Municipal Tramways Association," the Mayor of Blackburn, Councillor J. Stanworth, thanked the Mayor of Brighton, the chairman of the Brighton Tramways Committee, and Mr. W. Marsh, engineer and manager of the tramways, for the excellent arrangements that had been made. He paid a tribute to the work of the general secretary, Mr. J. Beckett, and said that the keen competition that they met with must be countered with a cheaper, quicker, and more comfortable service. Ald. Higham responded, claiming that transportation was a public service that ought to be in the hands of the local authorities, but ought not to be used to make a profit and relieve the rates. Mr. P. Priestley, President-elect, proposed the "Corporation of Brighton and the Tramways Committee," and the Mayor of Brighton responded; the toast of "The Visitors" was proposed by Mr. W. Chamberlain, general manager of the Leeds tramways, Mr. Marshall Harriss, general manager of the Dublin United Tramways Co., responding.

A Group of well-known Members.

Leaving Arundel Castle.

The dinner was followed by an informal dance, which was very enjoyable.

Friday, September 11th, was devoted to tours in the adjoining country. The weather was delightful, and a motor-coach trip during the morning through Worthing to Arundel, where the castle and grounds were open for inspection, was thoroughly enjoyed. In the afternoon there was a circular motor-coach tour through Tunbridge Wells and East Grinstead, the two journeys taking the company through much of the most delightful scenery in Sussex.

The Royal Pavilion was thrown open in the evening on the occasion of a reception by the Mayor and Mayoress of Brighton, and the dance which followed was attended by a large number of members and friends.

The Conference was considered to be a most successful one, the attendance being a record.

Municipal Tramways and Motor Omnibuses.

Discussion.

Councillor J. Peach (Chairman, Northampton Tramways Committee) proposed a vote of thanks to Mr. Fearnley for his paper. Councillor D. W. Beaton (Chairman, Aberdeen Tramways Committee), who seconded, said that the municipalities would have to adopt the determined attitude outlined in the paper. They had been compelled to municipalise the supply of gas, water and electricity, and the transport service was no less important than any of those three. Councillor J. H. Whittaker (Chairman, Todmorden Tramway Committee) urged the necessity for co-operation between the municipal tramway authorities in connection with the provision of services as connecting links between their various tramway systems. If the local authorities did not, either jointly or individually, provide such services, they could not reasonably object to private enterprise being allowed to provide them.

Councillor F. Burt (Sub-Convener, Glasgow Corporation Tramways Committee) said he was a thorough tramway man, but considered that the tramway undertakings wanted some brushing up. The tramway departments were inclined to look upon themselves as being the ultimate end of everything in the way of street transport. The public did not travel by tramcar instead of the 'bus because of the lower fares on the tramway, but they preferred the 'bus because of its higher speed. He suggested the use of single-deck cars, because the present-day double-deck monstrosities could not run along a country road at high speed. He also suggested sidings in parts of the city, where the slow cars could deposit passengers and allow the fast cars to pass.

Mr. H. Mattinson (General Manager, Manchester Corporation Tramways) said it must be acknowledged that the companies were here, and had a field of operation which could never be handed over to the municipalities. On the other hand, municipal transport officers, and their committees, claimed, and would insist upon, their right to provide transport facilities within their spheres of influence, which were not necessarily limited to their particular boundaries. The solution of the competition problem was for the Association to promote a Bill to bring about adequate laws to regulate the motor transport of the country, both public and private enterprise; there should be an adoptive Act. He saw no reason for despondency with regard to competition, and had not the slightest doubt that the tramway was *the* instrument and that there was nothing even remotely likely to oust it from its position as the prime mover of the public.

Mr. C. J. Spencer (Honorary Member) said the street transport problem was how to carry the maximum number of people in the shortest possible time at certain times of the day, and the vehicle which would do that most satisfactorily was the one with the largest capacity, within reason. He criticised Mr. Fearnley's figures, which showed that in 1919 the cost per seat provided on a motor 'bus was 114.1 per cent. more than the cost per seat on a tramcar, whereas for the four months ended July 18th, 1925, the difference was only 27 per cent. The 'bus did not pay towards road maintenance a sum commensurate with the damage it caused; the tramways were contributing large sums to the maintenance of the roads used by their competitors, and the Association, by allowing that to go on, helped their competitors in no small measure. The way out of the present difficulties was to develop tramways more. Referring to the common talk that the public preferred the 'bus to the tramcar, he said recent statistics showed that, when tramcars and 'buses were operating at the same fares on the same route, the average passenger took the vehicle that came first.

Alderman T. Woffenden (Deputy Chairman, Huddersfield Tramways Committee) said that every municipality should have powers to enter into through-running agreements, and those powers could only be obtained by co-operative action between all municipalities, led by the Association. The small councils which were now refusing to give municipal tramway authorities permission to go through their districts would, in time, have to develop, and if the powers referred to were not obtained by the municipalities, those small councils would have to buy the existing undertakings and would have to pay for the neglect of to-day.

Councillor J. G. Frazer (Chairman, Dundee Tramway Committee), referring to the lack of efficiency of municipal tramways, pointed out that the managers were subject to municipal and political expedience.

Councillor V. L. McEntee (Chairman, Walthamstow Tramways Committee) said that efficiency and publicity was the keynote of success in the future, and suggested that the local

Press in the various districts might be used by tramway authorities for publicity purposes.

Mr. J. S. D. MOFFET (General Manager, Salford Corporation Tramways) said he would not hesitate to recommend the scrapping of tramways if he could find something better, but for certain classes of traffic he did not think there was anything better. Speeding up the tramcars had its limits, because the convenience of the public must be studied, and higher speed might defeat the object of the tramway authorities in connection with the short-distance traffic. The tramcar was the most efficient vehicle for the door-to-door or street-to-street traffic, but at present there was nothing but the motor 'bus for the non-stop or limited non-stop type of service for carrying passengers outside the towns. He urged the Association to find some general clause which could be inserted in general Acts, giving municipalities running powers outside their boundaries.

Mr. W. MURRAY (Manager, Walthamstow U.D.C. Tramways) criticised the Association for its lack of vision with regard to motor 'bus competition. The Association had demanded equality of opportunity, but that was no use. The peculiar thing was that, whilst the Association was asking for equal opportunities, those in power were willing to give more. Sir Henry Maybury (Head of the Roads Department of the Ministry of Transport) had said that Parliament was going to protect the tramways, whilst a Departmental Committee of the Ministry, dealing with this question, in its interim report, had recommended that the licensing authority should have power to limit the number of licences issued and to revise them where an adequate and satisfactory service of suitable vehicles was already being given. He recommended that the Association should revise its attitude and policy, because equal opportunity would not save the tramways.

Mr. R. S. PILCHER (General Manager, Edinburgh Corporation Tramways) said that if 'buses were allowed to compete over the long distances, it would not be long before they would compete in the centres of the cities for the short-distance traffic. Comparing the 'bus with the tramcar, he said the modern 'bus was commodious, well lit, well sprung, it ran on pneumatic tires, and had all the latest appliances on it. On the other hand, many tramway systems had plant which was 25 years old. Appealing for higher speed, he said the cars at Edinburgh ran at 24 m.p.h. on the level, but that was not the limit, because the cars were fitted with 50 h.p. motors. It was his intention to apply to the Ministry of Transport for permission to run at a higher speed still. Finally, he urged the scrapping of old equipment.

Councillor A. STARK (Member of the Hull Tramway Committee) said it was no use attempting to fight motor transport; it was up to the municipalities to own and control it. As to speed, it was not so much a question of speeding up the tramcars as of preventing the 'buses exceeding the speed limit, because a safe speed limit for any city was a speed which any municipal tramcar could do easily.

Councillor S. F. JOHNSON (Chairman, Southend-on-Sea Tramways Committee) agreed that the 'buses could not be fought altogether, and that in many districts they were fulfilling a public need because the municipal tramways were not allowed to do it. If the trams were scrapped, 'bus fares would eventually go up, and it seemed to him that the cry for the scrapping of the trams was raised in order to put the 'bus companies in a better financial position in the future. When the 'buses had had as long a life as the tramways, unless they put by a good deal for depreciation, they would meet with the same difficulties as the tramway undertakings were meeting.

Alderman R. T. FLETCHER (Chairman, Wigan Tramways Committee) suggested that the title of the Association should be "The Municipal Transport Association," because the last word was not spoken when they had dealt with tramways.

Alderman W. C. FENTON, J.P. (Deputy Chairman, Sheffield Tramways Committee) said that when the new Ministries were instituted, the municipalities lost a lot of their local authority; with the disappearance of the Local Government Board they lost a certain amount of local autonomy, which they should regain. He disagreed that all the tramway concerns had shown lack of vision; with an astute, far-seeing and energetic manager, and a sympathetic and enterprising tramway committee, they could do a great deal more than they were doing.

Mr. FEARNLEY, replying to the discussion, said it rested with the municipal tramway authorities to see that the ideal of public service was properly catered for and carried out. The proposed joint board for the working of the tramway systems in the fringe towns of Lancashire and Yorkshire was a great idea, and should be pushed for all it was worth. The opinion that the public would ultimately support the system which gave the best service was certainly sound. It was not true that the present double-deck tramcars could not be speeded up. The single-decker was not the solution of the problem; it had been tried out in many towns, including Sheffield, where the Corporation had been glad to get rid of them to tramway companies at a very low price. As to competition, if the 'buses would keep to the sphere left to them after the municipal tramways had covered the sphere outlined in the paper, the latter would keep to theirs and be satisfied. The 'bus could take the place of the tram only if the tramway men allowed it. Mr. Fearnley submitted that the 78-seater tramcar did not provide the comfortable accommodation which the modern 'bus provided. The latest type of tramcar must be compared with the latest type of 'bus, and that was done in the paper. As to obtaining powers to run omnibuses without the necessity for going to Parliament, these powers could be obtained if the 98 municipalities represented by the Association made up their minds to get them. It was the intention of the paper to show that it was the competing vehicle which was making the most progress, and that it was necessary for tramways to make more progress. They must be quietened, brightened and painted. Mr. Murray had said that London had been up against the difficulty of competition for years; if that were so, why had not the London area moved and helped itself? The whole of the London local authorities had operated in splendid isolation and that had in a great measure brought about the position in which they found themselves to-day. If the London municipal areas had demanded with one voice, 15 or 20 years ago, the right to operate motor 'buses in connection with their tramways, would not they have got it?

As to the suggestion by Councillor Stark that the speed of motor 'buses should be restricted, that was absolutely the wrong way to deal with the matter. The tramways did not want to pull the other people back, but to beat them. He did not think Parliament would decide which system would survive as the local passenger system; the public would do that. Although Alderman Fletcher had said that the Committee had moved with the times, yet he had three systems of transport in Wigan. He (Mr. Fearnley) would ask those who had three systems to think over the question: "Can anything but the motor 'bus hold the motor 'bus?" That was the crux of the whole matter.

Tramcar Stopping Places.

By JAS. DALRYMPLE, C.B.E.

(*Abstract.*)

If we are to compete successfully with the motor omnibus, we must tighten up our schedules, and one way to do this is undoubtedly to abolish some of our car stops. I have got some valuable information from a number of managers regarding the number of stopping places on their respective systems. On some systems the average distance between stops is given as 160 yards, and on others the figure is as high as 400 yards. I would like, very soon, to go more particularly into this question with the managers who can successfully operate a city tramway system with an average distance between stops of 400 yards. Speaking generally, I think that for many years the tendency has been to increase the number of stopping places. Tramway committees and managers are continuously receiving requests for additional stops.

In Glasgow this question of increased speeds has only come to the front during the past six months, and it has been raised solely on account of the speed of the omnibuses running in competition with the cars. Six months ago the average distance between stops was 184 yards. In rearranging the stops we endeavoured to have not more than four stops for each fare stage, the average length of the fare stage being about 1,200 yards. This, however, could not be rigidly adhered to, especially in the central areas. Altogether we were able to abolish about 600 stops, and the average distance between stops is now about 240 yards instead of 184 yards. It is not possible to say exactly what effect the abolition of stops has had on the schedule speeds. There is no doubt, however, that it has been considerable. On one route we increased the average speed by on-and-a-half m.p.h.—one mile of this was an actual increase of speed and the remaining half-mile was the result of having fewer stops.

The present average speed may be stated as:—

From depôt to depôt, 8.56 m.p.h.; from terminus to terminus, including lie-over, 8.86 m.p.h.; and from terminus to terminus, excluding lie-over, 9.20 m.p.h.

The alteration in speed has meant practically an increase of one mile per hour; and this increase of one mile per hour has been made possible partly by the abolition of 600 stopping places. One very striking result of this increased schedule speed has been to release 70 cars from service. I do not know that we have always fully appreciated the full effect of even a slight increase in schedule speed. I think it is generally admitted that the only advantage the motor omnibus has over the tramcar is in the matter of speed, and even this advantage can only be got by the driver of the omnibus breaking the law.

You are, no doubt, aware that we have had in Glasgow a by-law in operation since 1912 which reads as follows:—

"When a tramway car is standing at a tramway stopping place, as such stopping place is indicated by a notice on the side of the street, every driver of a vehicle who intends to pass on the left or near side of such car shall draw up immediately before arriving at such stopping place until the roadway is clear of passengers entering or leaving such car."

It is now very seldom that the driver of a vehicle of any description attempts to pass between a car which is standing at a stopping place and the footpath when any person is boarding or leaving the car. The by-law has been carried out to the entire satisfaction, not only of the drivers and motorists, but also of the Tramways Department and the travelling public. I am also satisfied that this by-law, as administered in Glasgow, has the unqualified approval of the police, the Automobile Association and the carting contractors in the City. So far as I can ascertain, no section of the community would approve of this by-law being rescinded. The operation of the by-law works with perfect smoothness, and I have never heard it suggested that it causes the slightest unnecessary obstruction. There is no doubt that many lives must have been saved through the operation of the powers conferred by this by-law.

Discussion.

Alderman CAPTAIN D. CRICHTON (chairman, Belfast Tramways Committee), who proposed a vote of thanks to Mr. Dalrymple, said that the way to make tramway systems efficient and keep them up-to-date was to act on such solid advice as that given in the paper. In the matter of tramcar stops, some

ople were most unreasonable, and his view was that in all atters the advice of the manager should be taken.

Mr. H. Mattinson (general manager, Manchester Corporation Tramways), who seconded, said that no hard and fast le could be laid down, but he had found that eight stops per ile on roads which had no distinguished features was quite acticable. This gave a reasonable distance to enable the car accelerate, and not an unreasonable distance for the public walk. It was almost a revelation to imagine that, merely the adjustment of stops, 70 cars could be removed from the rvice, if that could be done without detriment to the service.

Mr. E. H. Rayner (general manager, Hull Corporation amways) said that one of the outstanding features of the per was the value of studying small things; managers often erlooked the value of seconds and minutes. Ten per cent. the speed made a tremendous difference to expenditure. e great trouble was the congestion of the streets with unecessary traffic, and efforts must be directed to controlling That was the only way in which to get full advantage of the improvements introduced into the tramway systems.

Mr. J. K. Bruce (general manager, L.C.C. Tramways) said at in 1912 the average speed on the L.C.C. tramways was 14 m.p.h. The average speed to-day was 9.6 m.p.h.—the stest speed, he believed, of any urban tramways in the untry. The result had been to retain the goodwill of the blic, and to enable a bigger service to be run without addinal cars. By increasing the speed from 8.44 to 9.6 m.p.h., 0 cars were saved, representing about £700,000 (present ices). The average distance between stopping places was w 220 yards, which distance, having regard to all the circmstances, approximated to the 240 yards in Glasgow. If, his system, the time lost at stopping places could be reced on the average by one second, a further saving of proximately £20,000 a year in operating expenses could be ected. By the use of high-power motors, which enabled e car to get quickly into its stride again after stopping, other affic which would get back on to the track again through e car stopping had not the time to do so, and the car was layed less in traffic, thus effecting further saving.

Mr. W. V. Morland (manager, St. Helens Corporation amways) expressed the opinion that, as rolling stock 25 years d was still in operation on some systems, it would be madness increase the speed of many cars without providing a new stem of braking. There was far too much physical effort curred in the stopping of tramcars, even with present speeds, ing to the use of the old type of hand-brake. In many cases eeding up would involve the adoption of the air system of aking with track shoes.

Councillor W. J. Armstrong (Leeds Tramways Committee) ggested that it was possible to give practically the same rvice with greater speed, and yet to maintain practically the existing stopping places, by letting each alternate car op at alternate stopping places, so cutting down the number stops made by each car. The stopping places could be rked with various colours, and the cars which stopped at ose places could bear a similar coloured sign. He hoped t the Executive Council of the Association would continue i efforts to prevent other traffic passing standing tramcars, d that those interested in tramways would do their best to icate public opinion against that practice.

Mr. W. Murray (general manager, Walthamstow U.D.C. amways) uttered a warning against speeding up, and thereby rlucing working costs, at too big a sacrifice. He asked Mr. lrymple whether, if he had three or four motor-'buses runng for every tramcar he put on the road, he would persist i cutting out his stopping places. The conditions of operation a tramcar and a 'bus were so vastly different that they could t both be dealt with in the same way, but a great deal of ne might be saved on the tramways by more alertness on t part of the conductors in starting cars.

Mr. Dalrymple, replying to the discussion, said he believed t the reduction of stopping places had had no effect on ther the number of passengers or the revenue; if it had had y effect at all, it had increased both the number of passen-rs and the revenue. The public were insisting upon speed, d if they did not get it, the tramways would lose business! h was satisfied that, whatever took place in the tramway rld, the cars must be speeded up, and that could be done the simplest possible way by eliminating stops. He agreed t some cars were not built for speed, and that, in order to t it, the equipment must be changed; that would involve a at deal of expense, but it would be absolutely necessary if mways were to continue as the means of street locomotion rough cities.

Opening of the North Wilford Station.

Any features of interest marked the proceedings at the opening, on September 17th, of the first section of the Nottingham rporation's new super-power station at North Wilford. e Mayor, in opening the proceedings, confessed that ce the first generating station was opened locally ttingham had not progressed with the times with regard electrical developments. Now, however, they would be le to supply, not only the city, but 17 urban districts in vicinity, covering a total area of 47 square miles. Alderan Huntsman then set in motion the No. 1 turbine, and, bsequent to a tour of inspection of the works, the company was entertained to luncheon. The chair was occupied Alderman Huntsman. The toast of the "Mayor and Corporation was proposed by Alderman W. Walker, of Manchester, who expressed the hope that the new station would be the means of substantially aiding Nottingham's industries; the Mayor acknowledged the toast.

Sir John Snell proposed "Success to the Nottingham Electricity Undertaking," recalling the fact that it was in Nottingham that the Commissioners held their first inquiry. He was confident, seeing that to-day they were selling only some 80 kWh of electricity per head of the population, that there was a very big expansion of business before them. He hoped that the Corporation would follow up its enterprise by a bold policy of low tariffs, which would attract new consumers. With regard to the new works, he desired to pay a tribute to his old friend, the consulting engineer, Mr. J. H. Rider. No doubt they had hoped he would be able to say something about the Government's electricity proposals, but he must disappoint them on that score. He could say, without indiscretion, that the North Wilford station, situate in proximity to an important coalfield and upon the principal waterway of that part of the Midlands, was in such a strategic position that, given the willingness of the Nottingham Corporation to extend it as might be required, it would become one of the largest stations in the country.

Preceding Alderman Huntsman's reply, a presentation was made to him by his *confrères* on the Nottingham Corporation Electricity Committee of a silver electric lamp, a rose bowl being also given to him which had been subscribed for by members of the East Midland Electricity Industrial Council (No. 7 Area) and the East Midland Electricity Joint Board, together with the engineers and other employés of the several undertakings, as a token of their appreciation of his valuable services.

In reply to the toast of the consulting engineers, which was proposed by the Town Clerk (Mr. W. J. Board), Mr. J. H. Rider emphasised the consideration that the new station would reduce in a very substantial measure the cost of generating electricity in Nottingham. The old stations ought to have been scrapped 20 years ago. Had the Nottingham output last year been generated at North Wilford, it would have meant a saving of £50,000 on coal alone. Whilst he did not know the price at which the Nottingham authorities would dispose of electricity, he advised them to encourage new industries by selling power at rock bottom rates. These might, at the moment, appear to be below cost, but a bigger load would bring the cost down right away, and everyone would benefit from a larger output. When the new machine to be ordered within a week or two was installed and they produced another 20,000 kW, the cost would come down again and Nottingham would attain the premier position among electrical undertakings in that area. On behalf of his firm Mr. Rider presented a loving cup to Alderman Huntsman, whose work and that of the Committee he eulogised.

The toast of "The Visitors" was acknowledged by the Mayor of Leicester, and Mr. Geo. Balfour, M.P., that of "The Contractors," which was proposed by Major W. E. Walker, vice-chairman of the Electricity Committee, being responded to by Mr. J. P. Gregory (of the British Thomson-Houston Co., Ltd.) and Mr. H. J. S. Mackay (of the Stirling Boiler Co., Ltd.).

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Rural Electricity Supply.

Your work on behalf of rural electrification deserves the thanks of all who are interested in the increased use of electricity. Those of us who have done what we can by speaking, writing, and by making ourselves a nuisance to the Post Office officials, and even to the Electricity Commissioners' staff, know how valuable the publicity you give to these matters will be in securing relief from our position as the most regulated industry in the world. A railway company may run express trains through a countryside within the enclosure of a mere rail fence; canals often have no fences; rivers never have them. The sea, the cliffs, the sidewalks are unrailed, and gas has its carbon monoxide content increased, and no one troubles. Suicides may kill themselves in any way they like, except by electricity. This is the one public utility service which must be regulated and hampered to its detriment, while the politicians tell us everyone must use electricity if the country is to be saved from ruin. Even the Electricity Commissioners are liable to think that regulations are more important than rural lines. Their personal experiences have been confined to work in cities and densely populated areas, and they cannot be expected to see our difficulties unless they are forced under their notice.

Mr. Borlase Matthews asks: "What does it cost to tap a power line—say, at 33,000 volts"? The answer is: "Tell me what precautions I have to take and I will tell you how much it will cost." There are no regulations dealing with the subject, but I understand some busybodies have their eyes on this one bright patch and are burning to draw up some more regulations.

The Mid-Cheshire Electricity Supply Company, which has a primary distribution system at 33,000 volts, can and does tap

its lines—protected by oil-break switchgear between it and the source of supply—at a cost (single-phase) of under £60, excluding land and the transformer, using an air-break switch and horn-break fuses. Our newer tappings will cost less than that. Repeated negotiations with manufacturers have produced a single-phase transformer as small as 25 kVA at a cost of £75 to £85, according to the low-pressure voltage. Smaller sizes are as yet tendered for with reluctance, and the cost is almost the same. Three-phase tappings and transformers cost about 33 per cent. more, but three-phase lines are too expensive for rural work. A single-phase 3,300-volt tapping and transformer of 5 kVA costs only £30.

We await permission to try a single-phase, 3,300-volt, single-wire line with earth return, and the longer this experiment is delayed the longer the villager and farmer will have to wait for their cheap and abundant supply of electricity. With the single-phase earth return line we can go to farm, village, and mansion, at 3,300 volts, but with 2-wire lines we can only take farms, &c., *en route* to large villages and mansions. Until we are freed from the shackles of over-regulation and the blight of the "Post Office" we cannot reach the purely farming areas on a commercial basis.

It is often presumed that the Post Office, being a Government Department, has a prior right to the use of the air and the earth, and that any other user must obey its orders. This is incorrect, and it is the duty of every distribution engineer to resist the monstrous and increasing claims of the Post Office, which, in fact, has no power to dictate. The Electricity Acts prescribe arbitration in all cases of difference, and concerted action should be taken to enforce the rights of electricity undertakers. The smaller undertakings cannot afford to fight this battle by themselves. The power companies will, it is hoped, see that the increased use of extra-high-pressure lines is hampered if every paltry interconnecting telephone circuit is to be kept overhead and the power line broken and carried underneath, or carried over on steel towers and guarded with heavy rod cradles at a cost of £250 per crossing in the case of 33,000 volts. The Post Office can, and do, put their lines underground when they wish; for instance, in cities and when leading into exchanges. Their talk of speech efficiency limits is a device to save themselves trouble—regardless of the enormous expense their refusal imposes on other utility undertakers, and therefore upon the users of electricity. If the Post Office trunk and interconnecting lines are so near the speech limit that a few yards of underground line will make them unusable, the sooner they are improved the better for the community.

A few cases like the famous Liverpool case will demonstrate the Post Office to be no more privileged than other public utility undertakings.

W. Fennell,
General Manager and Engineer.

The Roman Baths at Bath.

On August 7th last we published in the Electrical Review (supplement p. 11) an advertisement in which we drew a moral from the durability of the lead used by the Romans sixteen or seventeen centuries ago in the famous Roman baths at Bath.

We are pleased to note from your issue of this week (page xxxiii) that this advertisement has been paid the tribute of the sincerest form of flattery.

For the benefit of any others who may wish to use this particular idea, we may say that we have been courteously informed by the baths director at Bath of an error in our statement regarding the thickness of the sheet of Roman lead used for the floor of the bath.

We stated that this sheet of lead was ½ in. thick, but the director informs us that it is actually 1¼ in. thick. Naturally this fact does not affect the cogency of our argument in any way, but in the interests of archæological accuracy we think it well to draw attention to it.

Charles Stewart, *Director.*

Charlton, *September 18th*, 1925.

Current Literature.

I would like to suggest to you that it might be of considerable interest to your readers if you would publish weekly a digest of current literature on electrical and allied engineering subjects. You will probably know that this is done by the *Electrical World*, and also by the *Revue Générale de l'Electricité*, and I think that if you adopted a similar scheme it would be very much appreciated.

The *R.G.E.* prints the weekly digest on one side of the page only, the back being devoted to advertisements. This allows one to cut out any reference of particular personal interest, and paste it on to an index card.

If you are at all doubtful whether the scheme would be successful, I would suggest that you invite your readers' opinions on the subject.

P. Gilman Ashley, B.Sc.

Jarrow, *September 9th*, 1925.

[We are obliged to our correspondent for his suggestion. The matter has been considered from time to time, but is not so simple as it might appear to be.—Eds. Elec. Rev.]

Technical Training in Nigeria.

The art of teaching is not often appreciated outside a schoo
I had found my station engineer a resourceful man during th
start-up of this plant, and here is his way of instructing th
native shiftman.

One alternator was running on the system, controlled by th
voltage regulator, when a dead short tripped the main circui
breaker, and the machine voltage soared upward. The chi
at once took the regulator off, and Sam asked, in due cours
"Why?" The answer came pat:—

"Busbar speak to Regulator, he say: 'We want mo
volts.' Regulator, he speak to Alternator, say, 'He give mo
volts.' Alternator he agree."

"When voltage be right, Busbar he tell Regulator 'finish
Regulator tell Alternator 'finish.'

"But when that switch (*i.e.*, the main C.B.), he be ou
Busbar no fit speak to Regulator. Regulator he no savvy wh
to do, so he tell Alternator 'more volt.' Alternator no savv
he keep giving volts until *you* put Regulator switch off."

Sam said, "I savvy, Sir," and proved it by doing it himse
next time.

Such men keep stations running.

International Electrical Relations.

ONE of the principal financial daily newspapers published in London has rendered a service recently by publishing a series of articles on German Economic Conditions based upon material collected by its Managing Editor during a visit to Germany.

The sixth article of the series possesses a direct electrical interest because it advances the views expressed by Herr Kommerzienrat Paul Mamroth, a director of the Allgemeine Elektrizitäts Gesellschaft, on the question of foreign co-operation in the provision of capital for assisting economic recovery in Germany. This, it will be remembered, is not a new subject so far as the columns of the ELECTRICAL REVIEW are concerned, for we have already given somewhat full information showing to what a large extent American capital has been found during the past eighteen months for development work in connection with German electrical undertakings and manufacturing concerns.

Before referring to the statements credited to Herr Mamroth, however, we may make parenthetical allusion to a singular error into which Mr. R. J. Barrett, the interviewer, has fallen. As the accredited representative of a leading financial newspaper, who we should presume to be somewhat closely in touch with the electrical security market in London, one would hardly have expected him to be under the impression that the Allgemeine Elektrizitäts Gesellschaft was "better known in England as the General Electric Company." If he were moving immediately in British electrical circles he would know that the German company is better known here by the initial letters "A.E.G." than by the name quoted. Indeed, he would not have to inquire far in order to discover that there are in this country and in the States two very large concerns each of which has the right to be known as the General Electric Company. The letters "G.E.C." have been a household word here and throughout the British Empire for many years as relating to the General Electric Company, Limited, of London, Witton, and elsewhere. Some confusion occasionally arises here by reason of the fact that the letters "G.E." or "G.E.C." are an equally well-known household description for manufactures emanating from Schenectady. Perhaps when the new Monomark idea comes into use the postal authorities may overcome the difficulty of

deciding whether communications received in London are intended for Kingsway or for Aldwych, but we can hardly conceive of their passing on to the A.E.G. in London communications addressed to either the General Electric Company, Limited, or to the General Electric Company either with or without the use of Monomarks. It may be a pity that the names of competing concerns should be so similar, but at this late date we have to accept such things as they are and leave it to the reader to see that he understands the real differences.

The article in our financial contemporary does not become less interesting because of this error, for Mr. Barrett does not proceed to express his personal opinions regarding the general subject of foreign capital for German electrical industry; he is content to pass on the views of Herr Mamroth, to which we now turn.

It seems that there is no investing public in Germany to-day; the rank and file have not yet begun to accumulate money; foreign investors show no inclination to buy German industrial shares; therefore German shares "are to-day quoted at prices far below their true value." As soon as investment money accumulates in Germany, the public will begin to buy, the prices of the shares will rise, and British investors, if they come in now, will benefit by the rise. Simultaneously they will benefit Germany by providing the country with working capital.

Not less interesting than this is the statement that "short-term" loans are of no use to German industry, which for modernising plant needs "long-term" loans, repayable when the new machinery is running and paying dividends. Yet from almost every export market we are continually hearing that German traders are able to grant "long-term" credits to clients and so defeat the foreign competitors, including the British. Industry seems to obtain the funds from German banks or somewhere else to enable it to grant long-term credits, and it simultaneously invokes the aid of British investors to enable it to develop, modernise, and render more efficient competitively the organisations which already grant these favourable facilities to overseas customers.

Herr Mamroth obviously sees difficulties in convincing the hard-headed British investor, for he hazards a second possibility which is that foreign industry should buy works and plant in Germany and thus participate in production. Let it not be forgotten that he is speaking as a director of the A.E.G. What does he mean by the expression "foreign industry?" As we have said already in these pages, nobody can foretell what may be the developments that the future has in store in respect of international electrical relations, either financial or trading, but can it be that Herr Mamroth has thought of such a possibility as British electrical companies buying up the works and plant of the A.E.G. in Germany? Perhaps we have named the extremest possible case that occurs to us; of course Herr Mamroth and his friends will hardly be unmindful of the likelihood that there might be a less pronounced antipathy to German manufactures if ever such a thing, or any development approaching it, occurred.

The matter stretches far beyond the borders of the investment world; it becomes one of interest to all manufacturers and exporters, and has a bearing upon wages and hours and conditions of labour as Trade Unions would see in pondering their predilections for international labour organisation. It is true that the article before us says that in a "particular instance" (the motor-car industry) there would be no fear that either America or England, by assisting Germany financially as suggested, would suffer from the development of German industry, yet it is also recognised that when some kind of co-operation between German and foreign capital is found, German prices of motor-cars will fall. This case is taken because Germany is not a large exporter of motor-cars and cannot be at present. But the suggestion is made that "without injury to the investing country, foreign capital could be profitably invested in many other German industries not engaged in export," and that the increase of efficiency in production would increase the purchasing power of the German market for imported goods. The A.E.G. has a large motor-car production branch. So that, after all, though Herr Mamroth speaks as a director of the A.E.G., he can hardly be seriously thinking of British investors finding the wherewithal to develop the electrical manufacturing operations of Germany, for custom has not described these as an industry "not engaged in export." Perhaps it is intended that foreign funds if found for the Berlin Company would be earmarked for motor-car work and not for the electrical industry, though it is easy to see that benefit brought to the motor-car works would also assist the electrical operations.

Herr Mamroth favours long-term loans from England rather than from America, because "New York is so far away." He holds that only when there is close international co-operation will Central Europe really recover; that when the sluggish economic life in Europe is accelerated, "foreign capital will . . . have a direct interest in the prosperity of German industry, and will fructify it through working for its modernisation and rationalisation"; and, finally, that "the exchange of technical experience between rival countries that proved so fruitful before the war will again become a recognised part of our international economic system."

We quote the foregoing views, as it has been our habit for many years past to place before British electrical readers the reported opinions of leading electrical men in Germany regarding industrial affairs. We do not know that they really carry us very far, but they may assist British electrical and allied manufacturers in the deliberations in which we believe they are constantly engaged regarding possible adjustments of relations between this country and parts of Central Europe.

Municipal Tramway Matters.

The Municipal Tramways Association is to be congratulated on the very successful conference, of which a report is concluded in this issue; doubtless, as in the case of the I.M.E.A., the attractions of Brighton contributed to the popularity of the occasion, but apart from that factor, the conference gave abundant evidence of vitality and confidence in the future of tramways as the most efficient means of urban transport, which we believe to be fully justified.

It may be suggested that the change of name to "The Municipal Tramways and Transport Association (Incorporated)" is ominous of a coming change of transportation methods; but this is not the case. It merely implies that the municipal tramway managers have no intention of relying solely upon railed tracks, but are determined to move with the times and to adopt whatever aids to locomotion may present themselves. Already many undertakings possess considerable fleets of motor-omnibuses, and not a few have adopted the railless trolley-bus on certain routes; as trading undertakings they are logically entitled to avail themselves of all such auxiliaries as will increase the efficiency of their services and minister to the convenience of their customers. Tramways have been attacked in certain organs of the lay Press with a ferocity only equalled by the ignorance and irresponsibility of the allegations, but the Ministry of Transport, the London Traffic Advisory Committee, and the municipal authorities generally have declared their confidence in the soundness of the tramway system of transport, and the chairman of the Advisory Committee has explicitly stated that on the instruction of Parliament the Committee will give protection to tramways. We may point out in passing that if the tramways were relieved of the unfair burdens that are still thrust upon them, they would need no protection.

But it must not be thought that tramways and tramcars have reached perfection or anything like it; in

truth, as Mr. A. R. Fearnley indicated in his paper, tramway engineers have much to learn from the makers of motor-'buses, and we were pleased to publish recently particulars of notable improvements that were being introduced by the London Electric Railways on their tramway system. Mr. C. J. Spencer has on previous occasions pointed out in detail the wide scope for improvement that there is in tramway practice, and we should recommend other managers to "keep an eye on Spencer."

It must be borne in mind, too, that the handicaps under which the motor-'bus has hitherto laboured are being gradually lightened; its increased carrying capacity and speed, the introduction of covers on the upper deck, improved brakes, and comfortable seating, are factors which cannot be ignored, and at the same time its running costs have been brought down so far that they are not greatly in excess of those of tramcars. There is all the more reason, therefore, for the tramway associations to do their utmost to obtain relief from the cost of maintaining the pavement in good order for the benefit of other traffic, and from the other disabilities to which they are exposed.

One effective method of reducing operating costs was well illustrated by Mr. Jas. Dalrymple's paper on stopping places and speeds. There can be no doubt that the maintenance of high average speed is essential to the success of a transport service nowadays, and so much time is inevitably lost at every stop that the fewer the stops there are the better—within reasonable limits. The significance of this factor was driven home by Mr. J. K. Bruce, who stated that on the L.C.C. system alone, if one second could be saved on the average at each stop, an economy of £20,000 a year would be effected; and an increase of the average speed from 8.44 to 9.6 m.p.h. had resulted in a saving of 230 cars, representing a capital outlay of £700,000.

With regard to tramway finance, we cannot endorse the view of Alderman R. A. Smithson that the bleeding of the tramways for the relief of the rates is justifiable, unless it be to repay rate assistance already received. Here, again, the fact that the tramways maintain the roadway and thus relieve the rates to an important extent must be considered; were it not so, the paving would have to be maintained out of the general rates. Moreover, in many cases the tramways are compelled to carry workmen at reduced fares, involving a heavy loss of income which ought to be borne by the town as a whole; and in some instances they have been debited with part of the cost of street improvements. These burdens having been imposed upon the tramways, which nevertheless are often called upon to meet the competition of motor-'buses, it is unjust to deprive them of the profits which ought to be devoted to reserve and to the renewals that are now so urgently needed, the useful life of cars and rails in many undertakings having expired. As Mr. H. P. Stokes pointed out, one sees corporations borrowing money for renewals at a high rate of interest and at the same time allocating sums from tramway profits to the relief of the rates!

In view of the overloading with unfair charges, the milking of the profits, and the competition of motor-'buses subjected to neither handicap, it is a wonder that tramways ever show a profit at all. But when they do, let it be remembered that those profits have been provided by the passengers, mainly drawn from the poorer classes of the community that owns the tramways. Is it right to tax them in particular for the benefit of the general body of ratepayers?

Mining Electric Locomotives.

The announcement of the result of the competition for a prize of £1,000, offered by Mr. Charles Markham for the best type of locomotive for use underground in coal mines, was an event of considerable interest and importance not only to electrical engineers but also to the mining industry. As stated in our issue of September 18th, the judges decided to award the undivided prize to Messrs. Joseph Booth and Brothers, Ltd., whose design was the best of those submitted; but we have reason to believe that several of the competing locomotives possessed valuable features, and therefore we are publishing descriptions of them all, commencing, of course, with the winning design in this issue.

In the United States, we believe, electric locomotives have long been in extended use for mining, but the conditions generally prevailing there are very different from ours. The coal seams are much thicker, and gas is less prevalent, so that the use of trolley locomotives is practicable. In this country, on the other hand, most of the best seams have been worked out; the seams now worked are usually thin, the gradients are severe, and the presence of gas forbids the use of the trolley. Hence storage battery locomotives are the only alternative to rope haulage and animal power.

The necessity for the utmost economy in mining, for reducing to a minimum the use of muscular effort, whether human or animal, and for speeding up transport, led to the initiation of this competition, which has been very fruitful of result. We do not anticipate that there will be an immediate revolution in underground transportation—the use of electric locomotives is not unknown in British collieries—but the door has been opened, and we hope that steady progress will be made towards the general adoption of battery traction. Not least of its advantages will be the release of the pit ponies from their gloomy environment, which will gladden the hearts of all lovers of animals.

Electrical Benevolence.

The approach of the annual Festival Dinner of the Electrical Trades Benevolent Institution is brought to mind by the receipt of a circular letter from the President of the Festival—Mr. Edgar S. Barralet—appealing for support to the funds of the Institution, and pointing out that the ever-widening development of the electrical industry makes it certain that increased calls will be made upon its resources.

Fortunately the expansion of the industry, though it brings greater liabilities, also brings with it a larger field from which to derive support to meet them; but it cannot be expected that these new areas will bear fruit in due season unless the seed is sown, and it is incumbent upon us all to scatter that seed as widely and efficiently as possible. We would not reproach our readers with indifference to this duty—doubtless many of them already do their bit, and we know that some of them do a great deal of work for the cause; but it is certain that what is done is as nothing compared with what might be done by hearty goodwill. The electrical industry, even in these days of dull business, is comparatively prosperous, but its Benevolent Fund is absurdly small in comparison with the magnitude of the industry and the demands that must surely be made upon its benevolence in the near future. A fund of £100,000 would not be a penny too much.

We would also urge those who are in a position to do so to bring the matter to the knowledge of their associates, the majority of whom have probably never heard of the E.T.B.I., and have no notion that its existence is of direct concern to themselves; let them post notices in their offices explaining the objects of the fund, and summon meetings of employés—those who are not otherwise provided for—and thus sow the seed which will result in a large crop of new members. The cost to the members is very small compared with the benefits that are offered, and we believe that the only reason why the roll of actual members is not much larger is that the potential members have never been told about it. In this way, with little effort and less expense, employers, managers, and foremen can do good service not only to the Institution, but also to the employés.

Surely it is a small thing to ask of them! They go to great lengths in promoting the physical welfare of the workpeople by providing canteens, clubs, sports grounds, &c. Let them also give them the opportunity to protect themselves against penury in time of sickness and adversity by becoming members; and we further claim their support for the capital fund, to provide pensions for the old and disabled.

Electricity in Decorative Art and Applied Industry.

The Paris International Exhibition.

By T. RICH.

An International Exhibition of Decorative Art and Applied Industry is at present being held in Paris; it will remain open until the end of October. It occupies some of the open spaces around the Alexander Bridge, near the Place de la Concorde; it includes the Grand Palais where the annual Art Salon is usually held, covers the Invalides Gardens, and stretches to the west along both banks of the river for several hundred yards. It is not nearly as big as the Exhibition of 1900 or as imposing as Wembley, but all the same there is a good deal to be seen of interest. The Exhibition is backed by the French Government and the Municipality of Paris, a great deal of the cost being covered by the sale in advance of numbered "bons," containing a number of admission vouchers, the bearers of the "bons" having the right to a chance in prizes in lottery drawings; without lotteries or lotteries disguised as guessing competitions it seems to be difficult to run exhibitions nowadays.

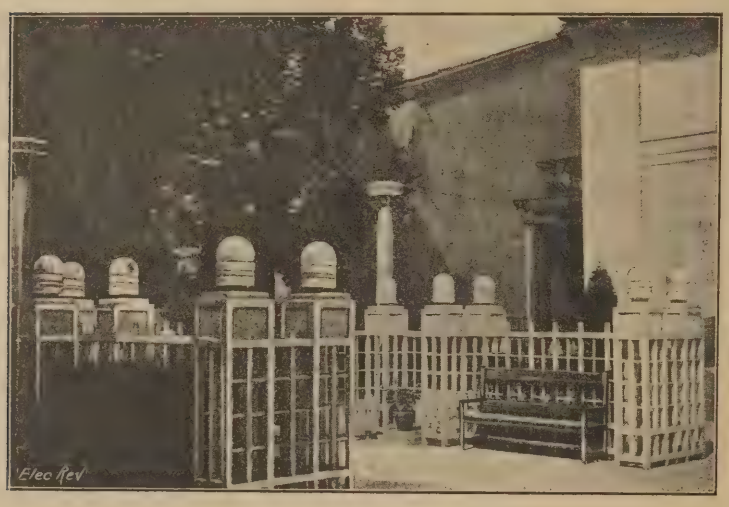

Fig. 1.—Garden Illumination.

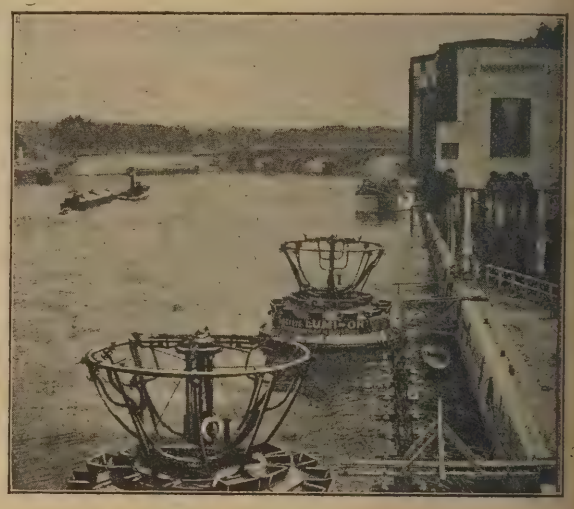

Fig. 2.—Floating Electric Fountains.

Illumination and Motive Power.

A great feature of the Exhibition is the tasteful way in which it is illuminated at night, many of the lighting fixtures attached to independent buildings being of a pleasing character. The general lighting is assured by 40 double-arm standards with two lights each of 1,500 c.p., 100 single standards each of 1,500 c.p., and 200 gas standards of 1,200 c.p., many of the latter apparently having been in place before the Exhibition was built. Many of the standards are of armoured concrete; they look clean and neat. Besides the lamp standards, many of the buildings and gardens have special illumination effects. Fig. 1 shows one of the courts in the Invalides Garden section, lighted by hemispherical opalescent globes placed on the top of an ornamental trellis work; the effect is very pleasing. There have been very few cases where the intensity of illumination installed at this Exhibition has been approached by exhibitions or other public attractions elsewhere, a total of 9,000 kW being arranged for over an area of 30 hectares or about 70 acres. Apart from gas mains, more than 16 kilometres (about 10 miles) of trenches have been opened for the laying of high, medium, and low-pressure mains, and more than 150 branches have been put in to various sections, buildings, pavilions, and kiosks. Ten sub-stations connected to 12,300-V mains have been constructed, and 40 transformer points for 3,000 volts.

The distribution generally is alternating current at 41⅔ periods, 110 volts and 220 volts (Paris and the Mediterranean districts being exceptions to the usual 50 periods), either single-phase or two-phase, the maximum voltage in the ordinary way between any two conductors being 220 volts. Where, however, motors of 3 kW consumption and upwards are used, either single-phase at 220 volts or a two-phase system with 220 volts across each phase is arranged for. In general, the regulations of the French Union of Electrical Associations have been applied to the electrical wiring and installations. In cases where the power requirements of any particular building exceed 25 kW, a separate transformer is installed in a brick cabin or compartment.

For the purposes of comparison, it is interesting to note that electricity is supplied to private owners of stalls and pavilions at the Exhibition at 93 centimes a kWh for lighting and 67 centimes for other purposes, based on a coal cost of between 125 and 135 fr. a metric ton, subject to an increase or decrease of 2.7 centimes for each ten francs by which the cost of coal varies above or below these limits. Those buying electricity at high pressure have a rebate of 20 per cent. Consumers have to guarantee for a minimum of 250 hours, the output of the meter installed, and have to pay a small fee, 5 cts., for lighting and 3 cts. for power for the current not taken up to that quantity.

Illuminated Cascades.

In the Middle Ages, Italy with her supplies from mountain streams was the home of many fountains, and in France in the palmy days of the Monarchy a number of ornamental fountains were constructed. Many of those who visit Versailles and see the fountain display on special occasions do not realise that the water is pumped up from the Seine by means of waterwheel-driven ram pumps installed over 150 years ago, the foundry work and general engineering work being, for their date, truly remarkable.

It might be remembered also that practically the first display of an electrically illuminated fountain was at the later exhibitions at South Kensington in the 'eighties, when an arc lamp, with changing coloured slides, was used to light a single jet, the arrangement forming one of the principal attractions at the Exhibition for the fashionable world at night.

At the Paris Exhibition an illuminated cascade has been arranged on both sides of the Alexander Bridge: also two circular floating buoys and two barges have been

arranged to give illuminated floating fountains; there is in addition an illuminated fountain in the Invalides Gardens. The cascades and floating fountains and barges have been designed and constructed under the supervision of Mons. E. Vedovelli, who was also responsible for the illuminated fountains at the Paris Exhibition in 1900.

To supply the cascades, a transformer station of 300 kW is arranged on the south bank of the river under the bridge; power at 12,000 V two-phase is transformed down to 220 volts with the neutral earthed, some of the cables connected up being under water. Two motors, each of 200 h.p., 800 revs., made by the Cie. Générale Electrique, of Nancy, directly coupled to centrifugal pumps, are arranged, one for the up-stream side and the other for the down-stream side of the bridge. On each side water is drawn from the Seine and pumped through a main 300 mm. dia. (11.8 in.) at a pressure head of 18 metres (59 ft.), the water pumped amounting to about 400 litres a second (88 gallons). Sixty secondary branch mains are placed along the face of the bridge, each with 150 holes 3 to 5 mm. diameter, that is to say, there are 9,000 jets on each face; the flow in each secondary main is regulated by means of valves.

Fig. 3.—Regional Transformer Cabin.

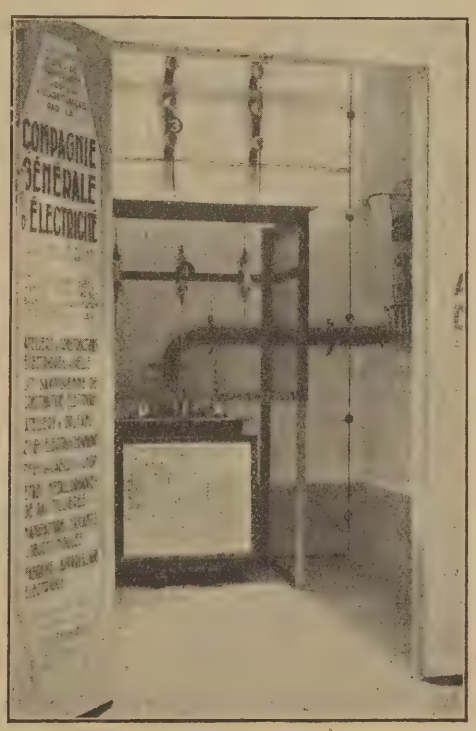

Fig. 4.—Interior of Village Transformer Cabin.

In the rear of the jets, in a position so that the direct light is shaded from the eye, a series of 70 reflectors are placed; these, which are made of silvered copper, are parabolic in shape and 40 cm. (15¾ in.) in diameter; in the focus of each is placed a "Luxor" incandescent lamp of 2,000 candle-power.

Many of these projectors are covered with coloured glass disk screens so that various colour effects can be given at will. Those projectors which are not fitted with coloured screens are provided with white glass front windows to protect the mirrors from the sulphurous smoke from passing tugs. Owing to the heat from the high-powered lamps, each reflector has a double wall in which cooling water is circulated, the reflectors' circulation being arranged in series on each side; a special pump is provided for the purpose, taking its water from the cascade mains. The lamps are arranged in groups on each side so as to balance on the two-phase mains. The cascades are started at nightfall and continue until the close of the exhibition; they are stopped when a boat has to pass, although some barges like the excitement of passing under the dazzlingly illuminated cascade.

Floating Electric Fountains.

Each fountain consists of a buoy-shaped vessel made of sheet steel, 7 metres (about 23 ft.) in diameter, drawing 1 metre of water (see fig. 2); it is arranged with a deck, on which are placed the various pipes and jets, access being obtained to the interior by means of a hatchway. There are three electrically-driven pumps inside each buoy, one of 200 h.p. which can give a pressure up to 70 metres head (100 lb. per sq. in.), a second of 60 h.p. with 30 metres, and a third of 6 h.p. for 6 metres.

The large pump is used to supply (1) a sheaf jet 80 mm. in diameter; (2) an effect like that of a sea shell; (3) an effect produced by eight inclined jets on a revolving ring, the turning moment being produced by the reaction of the jets; (4) eight parabolic jets.

Special precautions have been taken to prevent water-hammer when operating the various changes.

The second pump operates a sun effect and two crown-shaped water rings. The valves controlling all the different effects are of a special character, the actual operation being carried out with the aid of a sort of barrel-organ equipment of cams and plungers which can be arranged in the required sequence in advance. The third small pump is used to prime the pipes when starting, and to act as an auxiliary pump for some of the effects. For use in conjunction with the fountains illumination effects are produced by means of port-holes placed in the deck of the floating buoys. Eighty-four projectors are used, with elliptic mirrors giving an angle of dispersion of 60 deg. Each projector is fitted with a "Luxor" incandescent lamp of 3,000 candle-power; the mirrors, which are 30 cm. (11¾ in.) in diameter, are also arranged for water cooling, the circulating system branching off the main from the 60-h.p. pump. Each projector is surmounted by an arrangement of red, blue and yellow glasses mounted in slides, the 252 coloured glasses being operated with the aid of mechanical gear.

A special system of ventilation is used owing to the large output in a confined space; there is also electrically-driven mechanical gear by which some of the moving effects on the deck are operated.

Owing to the noise in a confined space, the telephone system by which instructions can be given to the operator has been the subject of a special study. The De Las Telephone Company supplied special telephones, the operators wearing special headpieces. A difficult problem has been to find a means by which the buoys can be swung into mid-stream, the running position of one being mid-stream above the bridge, the other being in a similar position below. The first is hauled into place and back by means of cables laid on the bed of the river and operated by a suitable windlass. The latter, which is laid up to the bank up stream in the day time and which is placed down stream when under operation, is hauled back up stream by means of a cable attached to the first buoy, the force of the current being at first considered sufficient to carry it into place down stream; owing to the lowered force of the stream, arrangements have been made by which a large jet of water under the water line is provided by the large pump, so that the buoy can be propelled into its place. Another problem to be solved was the cable connection of each buoy to the shore, as it would be inconvenient to place the cable on the river bed. Owing to the large horse-power required, the cables are in multiple; they are supported by a series

of floats (apparently made up of a number of large steel oil cans placed upright) fixed in frames, the floating frames being spaced 2 m. 50 (8 ft. 3 in.) apart.

There are two barges with fountains on their decks; each barge is 20 metres long, 3 metres wide, and about 80 cm. above the water level. All the apparatus for the operation is placed on the deck. Each barge has one motor of 60 h.p., directly coupled to a large pump giving a pressure head of 35 metres, and a motor of 40 h.p., giving a pressure head of 15 metres.

Each barge has a number of jets, some of which are arranged so as to obscure the actual shape of the barge. The hydraulic effects are fixed once and for all, but the lighting effects, which are arranged by means of "Luxor" lamps of different colours, are varied by means of continuously operating automatic gear for switching groups in and out. One must say that it is difficult in a description to do adequate justice to the remarkable effects obtained, though few of those who enjoy the spectacle would realise the ingenuity in design and skill in construction necessary to obtain the beautiful combinations of multiple water jets and colour which can be produced and changed so rapidly.

Transport.

There are two long narrow buildings on the left bank devoted to transport, the decoration and lighting of railway carriages and steamer cabins being special features. The six great railways in France, the North, the Western State, the Paris-Lyons and Mediterranean, the East, the Orleans and the Midi, have carriages on view. The last four carriages are of the first class; the lighting arrangements, especially of the last two, are more artistic than those generally met with in railway-carriage design.

In the steamship section, several of the leading French steamship lines show furnished and decorated "cabins de luxe." There again the artistic lighting is a feature. In one of the cabins the lights are placed behind ornamental white glass screens over cupboard and other doors; lights are also placed in one case in a chamber in the ceiling.

Transformer Cabins for Overhead Mains.

There is a section termed the Model Village, with school, mairie (town hall), an inn, and various shops, a feature being two transformer stations for connection to overhead lines, one being for a village, and the other for the connection of a district to branch district distributing mains. These transformer posts were designed and equipped by the Compagnie Générale d'Electricité, of Paris. Both posts are made of armoured concrete, high enough for the high-pressure mains to enter through round holes in glass panes, the panes being sheltered by deep overhanging cornices. Both posts are arranged as exhibits only, not being connected to any mains. The village transformer post is arranged on the incoming h.p. 3-phase, with leads to earth, lightning arresters and resistances on a branch; then on the mains, choking coils, section links, tubular fuses, and then connected with the h.p. transformer, 15 kVA, 5,000 V to 190/110. On the low-pressure side there is a small switchboard with a pilot lamp and multiple pilot switch (the pilot lamp can naturally be exchanged for a plug for a portable voltmeter when required), fuses, and a low-pressure switch. It is to be noted that there is no h.p. auto-oil switch and no ammeter on the l.p. side. If the l.p. switch is opened, the only current remaining is that due to the magnetising current of the transformer that the section links can look after quite safely (see fig. 4).

In the regional station the incoming mains are 22,000 V; there are two transformers, 22,000 V to 5,000 V, and two high-pressure auto oil switches, with the necessary links and arresters (see fig. 3). This cabin is designed to deal with two 5,000-volt overhead distributing mains. In both cabins the h.p. bare conductors are supported on insulators, wire guards being used to protect a visiting operator. The arrangements are distinctly neat, though in the former case perhaps more expensive than many small French communities can afford, the use of pole transformers being certainly on the increase in France. The cabins in question are distempered white inside, and for the purpose are roomy; they are arranged so that they can easily be kept clean.

On the ground floor in the "Salon" exhibition building there is a small section devoted to French makes of artistic electric lighting fittings, bronze and gilt brass standards, pendants and brackets, with cut glassware forming a number of the exhibits. The exhibits in this section are inclined to be too ornate and somewhat heavy; some fittings of simple artistic design in black, made up with square cow-bell shaped shades, exhibited by M. Max Le Verrier, are, however, particularly pleasing.

Arts and Crafts Schools.

On the first floor there are a number of rooms devoted to French secondary arts and crafts schools. In the former a number of cubicles are to be seen designed, decorated, and in some instances furnished by schools in various parts of France, local activities showing their influence on subject and design. In the sections allotted to craft schools, the displays devoted to electricity and the making of electrical machines and fittings are somewhat disappointing as compared with those of schools devoted to iron and brass foundry work, smithy work, carpentry and joinery, turning and fitting, although some of the electrical craft schools in France are noted for the good work they do. If these exhibits are anything to go by, then the French people, in their preparation for the supply of skilled workers to meet world competition, are not allowing the grass to grow under their feet; it should be remembered in this respect that during the war many industries sprang up in Southern and South-Eastern France, with corresponding demands for electric power supply, and many peasants in those parts have turned out very industrious workpeople. An instance of this can be seen in the electrical engineering industry started since the war at Tarbes, on the foothills of the Pyrenees. The section devoted to manual instruction tends to show that the French workers, instead of crying out for their alleged rights, and waiting for the moon to assist in the growing of corn that has not been sown, are setting to work to train up young people so that their nation can rapidly make up for the ravages of war by the skill and industry of its operatives.

Taking the Exhibition as a whole, one would think that the "Cubist" cranks of France had got together and called in to assist them the cubist enthusiasts from a number of different countries, as with the exception of Italy, Spain and Japan, in architecture, sculpture, decorative and textile art, it would in a number of instances be difficult to imagine exhibits so uniformly unrepresentative of the true spirit and mentality of the peoples and countries concerned. This applies especially to the design of the British Building; if it were not for the Royal Arms outside the building, few people, British or otherwise, would know what it was intended to be, although the long-suffering British taxpayer has to foot the bill.

In matters connected with electric lighting, while at Paris there is nothing to compare with the "skew-whiff" globes of Wembley, the native talent has broken through the veneer of morbid impressionism which can be seen in so many sections, and effects are produced which are highly artistic and pleasing; in engineering, the rolling stock section, and the machinery required for the operation of the fountains are evidences of healthy progressive design. One cannot travel through Northern France to Paris by day without noting electrical and engineering works in progress, which illustrate the true mentality of the people.

The Exhibition is worth a visit, especially as the lighting effects show up to greater advantage now that the nights are darker. For those who are visiting Paris for the first time it may be noted that by travelling *via* Newhaven one lands at the St. Lazare station in the West End close to the Exhibition, and within easy reach of a number of reasonably priced hotels.

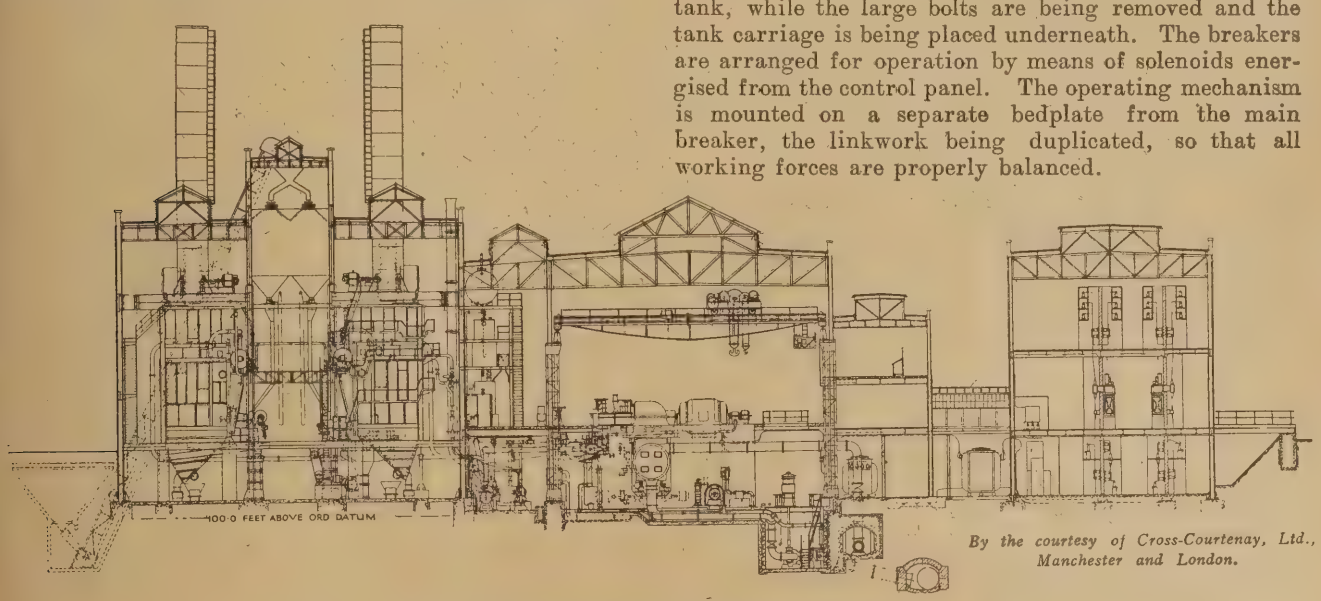
Electricity Supply in Salford.

The Agecroft Power Station.

(*Concluded from page* 503.)

The supply of energy for auxiliary power and for lighting is obtained from one 600-kW geared turbo generator and two motor-generator sets of 600 kW each. The supply to the motor-generators is taken from the main 33,000-volt system through transformers which step down to 6,600 volts. An electric storage battery having a capacity of 1,720 ampere-hours at a three-hour discharge rate, and an emergency discharge rate of 2,000 amperes for fifteen minutes, has been supplied by the Chloride Electrical Storage Co. The battery, which is controlled by reversible boosters, is also used to operate the high-pressure switchgear.

The whole of the turbine-house plant, comprising main generators, house-service plant, condensers, switchgear, transformers, and auxiliaries, has been supplied by the Metropolitan-Vickers Electrical Co., Ltd.



The main transformers comprise ten single-phase units of the outdoor oil-immersed self-cooling type, mounted on rollers whereby they can be rolled out on to a bogie carriage running on a sunken track at the correct level for easy removal. The units are of 4,667 kVA per phase, and are arranged to form three 3-phase banks of 14,000 kVA per bank with one single-phase unit as spare. The banks are delta-star-connected and are wound for 6,600/33,000 volts. Each bank of transformers is connected direct in the cable line between the 6,600-volt terminals of the alternator and the 33,000-volt switchgear. Two transformer units for stepping-down from 33,000 volts to 6,600 volts are employed for local service and auxiliary plant.

The switchgear is noteworthy in two respects, namely, it is one of two or three stations in this country in which all the switching for the main circuits is carried out at 33,000 volts; and the oil circuit breakers are amongst the largest installed from the point of view of short-circuit rupturing capacity. The whole of the high-pressure switchgear is contained in a three-storey detached building, 101 ft. long by 49 ft. wide by 64 ft. high. The 33,000-volt switchgear is accommodated in two rows of cubicles running longitudinally along the building, and the auxiliary and local service gear at 6,600 volts is mounted in a set of cubicles placed at right angles to the main gear, and situated at one end of the switch room.

The 33,000-volt gear is mounted in cubicles constructed of brickwork, fitted with moulded stone barriers and shelves to maintain phase separation. The top floor of the building carries the main and auxiliary bus-bars, with the circuit isolating and selective switchgear. The middle floor is reserved for the main oil circuit breakers, while the potential and current transformers required for instruments, with the cable isolating switches, are situated on the ground floor.

The oil circuit breakers are of a new design, embodying the results of extensive short-circuit tests. They are arranged on the middle floor in a central aisle, and as the design obviates the necessity of any cubicle structure, a compact and neat arrangement is obtained. The breaker is built round a single top frame, to which the oil tanks are secured by substantial hanger bolts. The design of the top frame is such that a separate air chamber is formed for each pole, and each chamber is fitted with a special vent to ensure that all gases are expelled after the breaker has operated under fault conditions.

The steel oil tanks are of circular shape, arranged so that when removing the tanks four small bolts hold the tank, while the large bolts are being removed and the tank carriage is being placed underneath. The breakers are arranged for operation by means of solenoids energised from the control panel. The operating mechanism is mounted on a separate bedplate from the main breaker, the linkwork being duplicated, so that all working forces are properly balanced.

By the courtesy of Cross-Courtenay, Ltd., Manchester and London.

Fig. 15.—Sectional Elevation of Agecroft Power Station.

Special provision has been made to deal with the great electromagnetic forces that may be transmitted to the operating gear without reducing the sensitiveness of the trip gear. The estimated rupturing capacity of the breakers under fault conditions is 1,500,000 kVA.

The isolating switches are of the pole-operating type, and are fitted with locking catches to prevent them from being blown open by the magnetic forces set up under heavy current conditions. The control board is situated in a room overlooking the turbine house, and is of the desk type, constructed of enamelled slate on wrought-iron framework. Each panel is equipped with the necessary instruments, control switches, and the indicating lamps required for the various circuits. The circuit breakers are operated by push-button switches in conjunction with indicating lamps and, in addition, separate lamps indicate to which set of bars a circuit is connected. These indicating lamps are combined with an arrangement of miniature bus-bars mounted on the sloping section of the desk, which enables the operator to determine at a glance the connections of the circuit. Duplicate synchronising gear is provided, and an automatic voltage regulator controls the machines and maintains the voltage of the system at a constant value.

A set of Chadburn's ship's telegraph instruments provides communication between the control house, the turbine house, and the boiler house.

The alternators and transformer groups are fitted with the Merz-Price circulating-current system of protection, which automatically disconnects the machine and transformer from the bus-bars in the event of an internal fault, and also operates the automatic field-breaking switch, limiting any damage to the machine to a minimum.

The feeder circuits are fitted with a balanced system of protection of the Merz-Beard type, in which the pilot cables are compensated to increase the sensitiveness of the system by reducing the effect of capacity current on the relays.

The neutral points of both the 6,600-volt and the 33,000-volt systems are earthed through resistances. The switches controlling the earth connections are electrically operated from the control desk, and indicators show which generator or transformer neutral is connected to earth. A bell alarm device is fitted to each resistance to announce when any appreciable current is passing through the earth circuit, while an automatic annunciator indicates the system upon which the fault has occurred.

The instrument transformers are of the oil-immersed type. Limiting resistances are fitted in all potential transformer circuits to prevent a rush of current in the event of failure. The bus-bars are in duplicate, divided by bus-bar sectionalising switches. At this point, reactances of the air-core concrete type are inserted to limit the amount of energy which can pass between the sections. Provision is made for the addition of further reactance between sections as the station is extended.

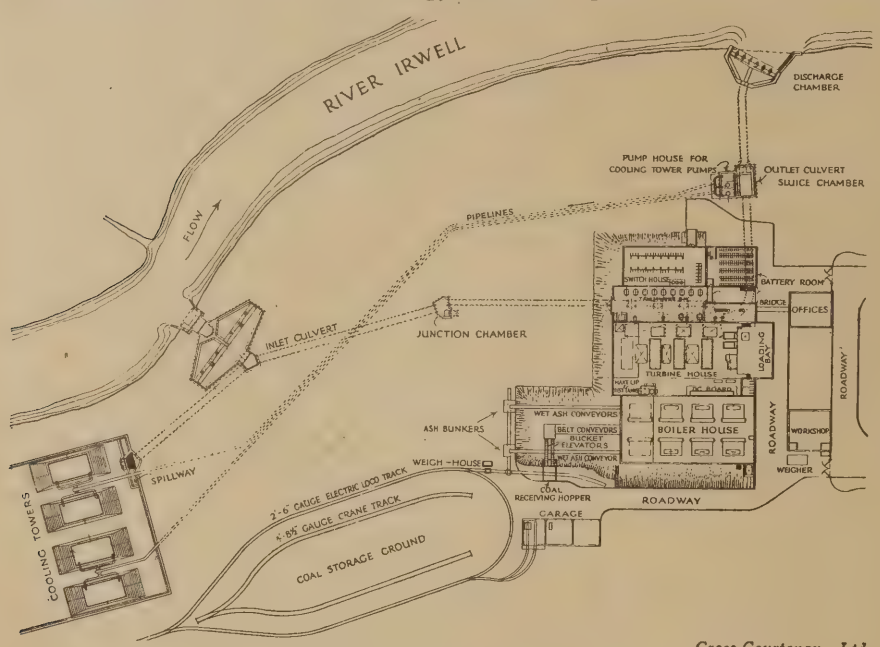


Fig. 16.—Layout of Agecroft Power Station.

Cross-Courtenay, Ltd.

The auxiliary plant is controlled from a 27-panel switchboard on the turbine floor in the power station. The panels are fitted with air-break circuit breakers, knife switches, and instruments. Duplicate bus-bars are provided, and all circuits are arranged so that they can be connected to either set of bus-bars, or the bars can be coupled in parallel should this arrangement be required.

At present three main lines for transmission at 33,000 volts are laid to the Frederick Road works, where energy is delivered through step-down transformers to the 6,600-volt distribution system. The transmission lines comprise three-core cables, each conductor having a sectional area of .3 sq. in. The cables were manufactured and laid by the British Insulated & Helsby Cables, Ltd. The step-down transformers are arranged in three banks of 18,000 kVA capacity per bank.

The power station has been constructed to plans and specifications prepared by Mr. J. A. Robertson, consulting engineer, who has also been responsible with his staff—with Mr. T. Brighouse as chief assistant—for supervising the construction and equipment.

Messrs. C. S. Allott & Son have acted as consulting engineers to Mr. Robertson, for the civil engineering work and buildings. Mr. D. E. Laing has acted as resident civil engineer.

During construction, and in the starting-up of the station, the consulting engineer has had the active co-operation of Mr. S. J. Watson, the borough electrical engineer, and his staff, of whom Mr. E. H. L. Dickson is deputy engineer, and Mr. J. Collinge and Mr. L. Romero, works superintendent and distribution engineer respectively.

The area of supply in the borough of Salford covers 5,202 acres, with a population of 239,000. In 1907, the Prestwich Provisional Order was leased to the Corporation for a term of 21 years, and has since been extended, thus adding to the supply area 2,448 acres with a population of 18,750.

The output last year was about 6 million kWh for lighting, &c., 28 millions for power, 10 millions for traction, and ¼ million for street lighting—the total being nearly 45 million kWh. There were 9,824 consumers, and the maximum load was 18,647 kW. For power purposes 1,038 consumers have installed 3,564 motors having an aggregate capacity of 43,317 h.p.

Fifty transformer sub-stations are connected to the 6,600-V system, with a capacity of 16,530 kVA of static transformers for alternating-current supply, and 16,850 kilowatts of rotary converters for direct-current supply. Twenty-seven sub-stations having a total capacity of 1,329 kVA are in use for converting the 3,300-volt single-phase supply to low pressure for distribution.

The capital expenditure at March 31st, 1925, amounted to £1,682,398, of which the sum of £709,354, equal to 42 per cent. of the total outlay, has been redeemed. The net capital liability was therefore £973,044. The total sums transferred from the net profits to the reserve and renewals fund, or accumulated by the investment of this fund, amount to £206,645. Of this sum £78,168 has been appropriated for work which would otherwise have necessitated an increase in borrowing powers, £66,848 has been utilised to improve the efficiency of the plant, and the balance of £61,629 remains in hand.

In addition to repaying certain deficits which occurred in the early years after the undertaking was established, a total sum of £154,584 has been transferred to the rate fund in relief of the rates.

The foregoing particulars are derived from a handsome souvenir which was issued at the opening ceremony.

Diesel-Electric Locomotives in Canada.—A special correspondent of *The Times Trade and Engineering Supplement*, at Montreal, states that the Canadian National Railways have been testing new types of cars operated by electricity developed by a generator within the body of the car. The cars are of two types—one small, with a body 60 ft. over all in length and capable of drawing a trailer; and the other heavier and with an articulated body, 102 ft. in length, which really consists of two bodies set on three four-wheel trucks. One of the new cars of the light type made the trip from Toronto to Montreal, a distance of about 335 miles, in only a little more time than is required for the regular trains drawn by steam locomotives. The experiments with these Diesel-electric cars represent an endeavour to escape the high fuel cost of locomotives dependent upon coal. Petrol-operated cars and, later, storage battery cars were built and put into operation on some short lines, but did not prove altogether satisfactory. The next step has been the Diesel-electric car, and the management of the Canadian National Railways claims to have proved from tests made over a period of months that it represents a type of motive power economical and serviceable in operation and well suited to suburban, inter-urban, and branch-line traffic, and that it may prove an effective competitor of the motor omnibus and lorry. In a recent test the fuel consumption of the lighter Diesel-electric car averaged one gallon per 4.6 miles, representing about 10 per cent. of the cost of fuel for similar steam operation.

Mining Electric Locomotives.—I.

The Markham Prize Battery-Propelled Machine.

The Brodsworth Colliery, near Doncaster, was the centre of great interest in May last when five electric storage-battery locomotives were tested in competition for the £1,000 prize offered by Mr. Charles Markham for the most suitable model for use in mines. The Mines Department took charge of the experiment, issued the technical requirements and competition conditions, and appointed Mr. A. M. Clegg to act as secretary. The adjudicators were: Messrs. J. A. B. Horsley, H.M. Electrical Inspector of Mines, representing the Mines Department; Roger T. Smith, of the Institution of Electrical Engineers; Roslyn Holiday, of the Mining Association; and Sidney Bates, of the Institution of Mining Engineers. Mr. Herbert Smith, of the Miners' Federation and the Yorkshire Miners' Association, was prevented by illness from acting as adjudicator. An official report on the tests is to be issued by the Mines Department.

The competition was international, but the machines which took part were all of British manufacture; of the ten models submitted five entered the final competition, and for the tests track rails were laid in a field and conditions were created approximating as nearly as possible to those of the underground pit workings. Preliminary to the running tests exhaustive battery tests were carried out by the Doncaster Collieries' Association. The prize-winning locomotive is described below, while the four others, each of which possesses points of merit, will be referred to in a later article.

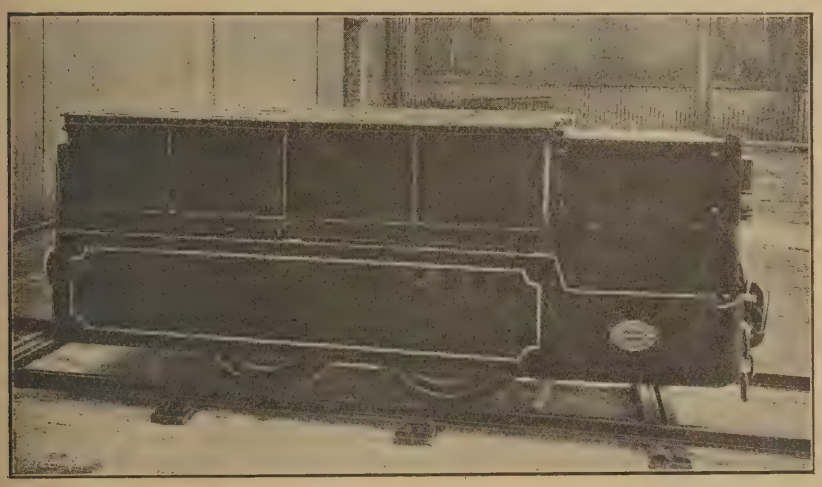

Fig. 1.—Side View of Prize-winning Locomotive, complete.

The "Union" Mining Locomotive.

This electric accumulator-driven machine was designed and built by Messrs. Joseph Booth & Bros., Ltd., of Rodley, Leeds, who have been building cranes since 1847, and have marketed several types of rubber-tyred industrial trucks. Although the machine illustrated in fig. 1 was specially designed to fulfil the conditions of the specification drawn up by the promoters of the competition, it cannot be said to be a new development of Messrs. Booth's, who have supplied locomotives for various classes of work both at home and abroad.

The radius of action of a locomotive is limited by the capacity of the battery; to reduce the loss of time which would be involved, in many cases, should the battery require to be re-charged during the working shift, which might result in the disorganisation of the whole haulage scheme, Messrs. Booth have patented a method of mounting the batteries. The cells, which are mounted in groups in hard wood crates, are housed in flame-proof mild steel boxes that are supported on rollers mounted on the locomotive frame, and locked in position by two pivot bars, one on each side of the locomotive, running the full length of the boxes, each being securely clamped by a single hinged bolt; the cables are taken in and out of the boxes by quick-releasing plugs. Should the battery become discharged at any inconvenient time, all that is necessary is to release the plugs and the one clamping nut, pivot the locking bar over, and roll the discharged battery off the machine, as indicated in fig. 2. A fully-charged battery can then be rolled into position on the locomotive and securely locked. The complete operation can be performed in less than five minutes.

The subject of a further patent is the fact that the locomotive consists of two units, *viz.*:—(*a*) The mechanical unit, consisting of the two axles and brake gear mounted on an inner frame, and (*b*) the electrical unit, comprising an outer frame carrying the motor, controller, resistance, circuit breaker, and all the electric cables. The outer frame is rigidly cross-braced with channels, which are carried on springs mounted in guides on the inner frame; tie bolts are provided through the springs to secure the two units together. This method of mounting relieves the electrical equipment, including the battery and also the driver, of shock due to the track, whilst for the purpose of overhaul the two units can be separated by unskilled labour, as no electrical connections are interfered with by the separation, and each unit can be dealt with by the department concerned. In the case of breakdown, the faulty unit can be replaced and repaired without the whole locomotive being placed out of action. When the battery has been rolled clear of the machine, the whole of the mechanism is visible for inspection, and each individual unit may be removed with a minimum of time and labour, while the simplicity of the whole construction is worthy of special note.

Power is derived from a single motor, manufactured by Messrs. Booth, and specially designed to fulfil the conditions laid down in the specification; it is of the four-pole type and the armature and commutator are of their standard type, being provided with pure mica insulation. The armature shaft is mounted on Hoffman ball- and roller-bearing, totally enclosed in dust- and water-tight housings. The motor is placed at the end remote from the driver, and transmits power through two flexible couplings and a cardan shaft to a free coasting worm and wheel on the axle nearest to the driver. This axle is of special alloy steel, oil hardened and ground to accurate limits, and is supported on Hoffman ball- and roller-bearings. The worm wheel is keyed to the middle of the axle and the worm is also supported on Hoffman ball-bearings, the whole being totally enclosed in a dust- and water-tight cast-steel case, the worm wheel being provided with an oil well. The projecting ends of the axle are tapered to fit the tapered bore of the wheels, which are secured by two keys at right angles and a clamping nut at the ends; they have cast-steel centres with rolled-steel tyres shrunk on.

The two axles are coupled together by connecting links placed at right angles and accurately balanced, and are provided with two substantial Hoffman ball-bearings at each end, mounted in dust- and water-tight housings. The coupled axle also consists of special alloy steel, oil hardened and ground, and supported on Hoffman ball- and roller-bearings in dust- and water-tight housings.

The brake gear, which operates on the rims of all four wheels, and is provided with a three-fold equalising device, is powerful and quick operating. The cast-steel shoes are lined with Ferodo, or similar material, and operated by the action of equalised cams, ensuring

equal pressure on all wheels by means of a screw and nut mechanism. A separate sand box is provided for each wheel, the valve construction of which is very simple, and the sand is conducted to the rails by means of india-rubber pipe, which cannot be damaged by derailment, or by striking any projecting object.

The inner frame consists of two steel castings, to which the axle housings and brake gear are bolted. Machined guides and detachable wearing strips are provided to receive the outer frame, and cross channels and sockets are also provided to receive the springs on which the outer frame is supported. Tie bolts pass through the centre of each spring, securing the two frames together, and subjecting the springs to sufficient compression to ensure easy riding. Should one or more of the springs fracture, the operation of the locomotive can be continued until such time as it is convenient to replace the broken spring. The spring-mounted draw hooks and buffers are important, as they reduce the shock to the locomotive, and especially the battery, when starting and stopping, as well as the strain on the links connecting the loaded tubs.

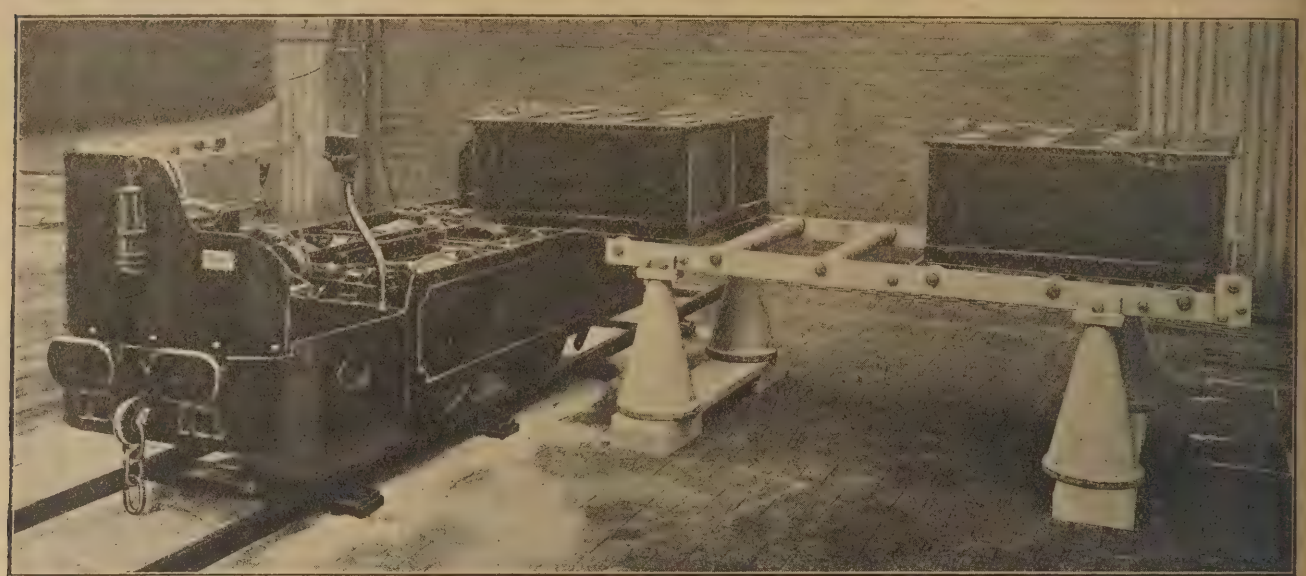

Fig. 2.—View showing one Battery Box off and one in process of removal.

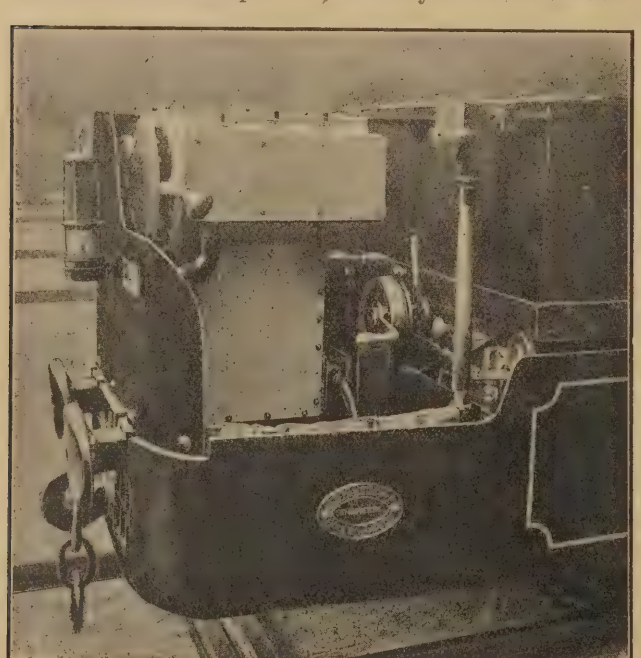

Fig. 3.—Driver's Well, showing Controls.

A circuit breaker of the quick-break, double-pole, free-handle type is mounted in front of the driver and the controller is immediately above it, being so designed that the drum fingers and finger bar inside can be removed as a whole without disconnecting any wires. This means that when it is necessary to clean the contacts, or to make any repair, a spare unit can be inserted in a few minutes without interfering with the duty of the locomotive while the necessary attention is being given to the damaged part.

The resistance, which is also supported on the outer frame unit, is of the "unbreakable" grid type, constructed of easily detachable units mounted in a flame-proof welded mild-steel case. The grids are insulated with special heat-resisting mica and cable connections are made by gunmetal sockets and lugs clamped to the grids.

The battery is housed in two units, which are supported on independent rollers. Each unit consists of two compartments having a ventilating space between them and rigidly riveted together, the object of dividing the battery being that a great radiating surface is obtained to dissipate the heat generated and to minimise the liability of a violent explosion occurring inside the battery compartment, as an explosion which may occur inside any one of the containers is localised to that container only. To facilitate ventilation and internal pressure relief, wire gauze and valve plates are provided in the cover plates. This point is also covered by one of the patents taken out for the machine. The Kathanode batteries were made by the D.P. Battery Co., Ltd.

Care was taken to produce a thoroughly flame-proof construction. All the electrical units are equipped with flame-proof terminal boxes, fixed insulated studs being provided for carrying the conductors from the terminal boxes into the main housings. All the cables are totally enclosed in steel tubing screwed into the terminal boxes on each unit. The whole machine is fire-proof, as any material which is liable to catch fire, or be affected by excessive heat, is encased; should any part take fire, it is impossible for the flame to reach the external air.

The general design of the locomotive has been somewhat improved since the competition was conducted, the overall dimensions now being:—Length 10 ft, width 3 ft. 6 in., and height 3 ft. 6 in. The road clearance between the wheels above the top of the rails is 5⅞ in. The machine is capable of hauling a load of 5 tons on the level at a speed of approximately 6 m.p.h., or 20 tons at approximately 3 m.p.h., and has a starting pull of approximately 2,000 lb.

Electricity Supply in the United States.—The *Electrical World* recently published statistics of the output of electricity in the United States during the first six months of the current year. The total amount generated during this period was 29,104,105,000 kWh, as compared with 26,837,908 kWh in the equivalent period of 1924—an increase of 8.4 per cent. The revenue increased in approximately the same proportion to $716,400,000. The proportion of the energy generated by hydro-electric plant was 38.4 per cent. The production of hydro-electricity increased to a slightly greater extent than the output of steam stations.

The Electrical Industry of Mexico.

The Prospects of Revival.

By PERCY F. MARTIN, F.R.G.S.

One of the most interesting features in the electrical industry of Mexico is the fact that the same powerful influences that established, in 1892, the first power station in that Republic, still control one of the more important enterprises supplying light and power in that country. The pioneers in the transmission of hydro-electric power have maintained their interests through good years and bad, even amid what appeared to be altogether hopeless conditions. The organisation has been thorough and complete, and conducted with so much discernment that, with a revival of Mexican industries in general, the prospects of which have been considerably enhanced by the recent resumption of diplomatic relations between that country and the United Kingdom, the electrical industry in practically all branches should prominently participate.

Commencing with the construction of a hydraulic installation for the supply of power to a jute mill on the Rio Blanco, belonging to Lord Cowdray (then Sir Weetman Pearson), in 1892, a number of electrical companies providing light and power organised under the same or other British influences, have come into existence, having been nursed through Mexico's most troublous times, and, fortunately, having sustained very little damage. Moreover, the demand for the supply of electrical energy has remained constant with the growth of the chief Mexican commercial centres, and these are numerous. With its abundant water-power, Mexico should enjoy a long period of industrial success.

Amounting at first almost to a monopoly, granted under the ægis of the Diaz Government, Mexican electric light and power utilities have not been seriously interfered with by its successors. Endowed with sufficient reserves to undertake such costly enterprises, any capitalist or body of financiers would now receive equal encouragement. The equitable attitude of the authorities in granting moderate rate increases, together with the decrease in operating costs, have put existing working companies upon a sounder footing, and have greatly improved the value of their properties.

The Callés Administration, while retaining the power, set out in the original concessions, to supervise rates, prescribe uniform systems of keeping accounts, direct any new financing deemed necessary from time to time, and generally to control electrical undertakings in the country in the public interest, allows ample latitude to the respective managements of such utilities. These, upon their part, continually work for a better service while naturally seeking for a decrease in the cost of producing electricity. They have found that this can be best effected by interconnection of the several large stations by extensive transmission systems.

The Mexican Telephone and Telegraph Company, one of the oldest foreign enterprises formed in Mexico, established more than 37 years ago, has been granted a concession by the Congress of the State of Tamaulipas to install an automatic telephone system in the city and port of Tampico, which is also the capital of that State. The company, which already possesses 32,000 miles of line, distributed over ten different States of Mexico, is enabled by the terms of the new concession to take over several small independent lines—mostly at present unremunerative—and to connect them up with its existing lines. The company gained its present valuable concession in the face of very severe competition. Its nearest and most powerful rival is the Swedish-owned Ericsson Telephone Company (Telefonktiebolaget L. M. Ericsson), which has already gained a strong footing in Southern Italy, and is endeavouring to secure and maintain equal influence in Mexico and other Latin-American States.

The Government of the State of Coahuíla has granted a Torreón firm, Messrs. Figueróa y de la Mora, a concession to construct and operate a telephone system in that important commercial and mining city, with a monopoly for twenty years. The company, at the same time, is authorised to extend its lines to any part of the State that it chooses. Exchanges will be constructed at Torreón, Matamóros and San Pédro, in the State of Coahuíla, and at Gomez Palacio and Lerda, in the adjoining State of Durango. Underground cables will be laid in the business district of Torreón, and between 800 and 1,000 telephones of the latest approved type will be installed. With the exception of the necessary poles, which will be supplied locally, the concessionary company will purchase the whole of its equipment abroad. Notwithstanding the advantageous proximity of the United States, British manufacturers should become interested, and those desirous of competing should communicate (either in Spanish or English) with Messrs. Figueróa y de la Mora, Callé Valdez Carillo, Torreón, State of Coahuíla, Mexico.

In the Province of Chihuahua there is under consideration a concession for the construction of a large irrigation and hydro-electric project. An expenditure of 20,000,000 pesos (about £2,000,000) is involved in the scheme, and it is proposed that, besides providing irrigation for 200,000 hectares (approximately 500,000 acres) of new land, the undertaking will furnish electric power in the neighbourhood.

The town of Comayagula, virtually a suburb of Tegucigalpa (Mexico), has decided upon establishing an electricity supply. Inasmuch, however, as the total population to be provided for does not exceed 10,000, the installation would be but a small one.

For many years past the Conchos River has been regarded as a possible source of electric power. After passing Presideo del Norte (Ojinaga), this river and other tributaries supply the Rio Grande with water, thus enlarging its stream and rendering it especially suitable for commercial exploitation. At length, after several years' negotiations, the Government has consented to the employment of the river's waters for a hydro-electric generating plant, and has granted a concession to an electric power company which already commands practically the largest of the water-power installations of the country. The new contract supersedes three others granted at various periods, and will date back from 1909. The terms of the contract call for the construction of a dam 70 metres in height, capable of impounding the waters of the Conchos River to the extent of 1,000 million cubic metres. There will also be a second dam of smaller dimensions, as well as some highly-important hydro-electric works to utilise water for power up to 50,000 litres per second as a maximum.

There are now four radio broadcasting stations of considerable size in the Republic of Mexico, in addition to six of smaller dimensions. Government licence, regulation and inspection are necessary for all receiving as well as transmitting stations. It is estimated that there are 20,000 sets in the capital alone, while 12,000 others are distributed about the country. Ninety-five per cent. of the whole supply has been received from the United States, since British manufacturers, following the disruption of political relations with Mexico, have troubled little to maintain the small amount of electrical trade that they formerly held. Perhaps now that friendly relations have been resumed—the probable effects of which must not be exaggerated from a trading point of view, however—renewed efforts to furnish radio, among other electrical supplies, from the United Kingdom will be made.

The Designer and Initiative.

By W. ROLAND NEEDHAM,

It is the claim of many that they do not get their chance. In some cases, at all events, this is rather an excuse than anything really valid. There is rightly an opportunism which is not compromise; it is the legitimate expression of initiative, being the opportunism of those who see clearly and act promptly. Keenness of vision and spontaneity of action are doubtless to a certain extent instinctive and intuitive, but they are trained faculties also. The man of initiative seems to make opportunities. This is largely an illusion. What he really does is to seize what offers as soon as ever it does offer; and he acts decisively.

Alertness, foresight, and longsight, determination, and concentration of purpose are all just normal characteristics of the man who keeps eyes keen, brain active, and will straining at the leash. Intuition is not all. Ideas are not all. This kind of genius reveals itself where the intuition is guided rightly, and the idea is turned to useful practical account.

It is not only in industry, nor in any one direction, that scope and opportunity exist for men of insight and action to make good. In all directions, and in every branch of industry, the rule obtains.

Great opportunities exist now, no less in engineering than in other industries. They pertain to each separate branch of engineering. The great essentials are these: (*a*) Wide-awakeness; (*b*) the knowledge which can appreciate a need and appraise a remedy; (*c*) concentration of mind, and the self-control this occasions; and (*d*) the ability to give form and content and a body to the offspring of the mind. One must be prepared on occasion to cut right across one's habits of comfort and love of ease; be willing, even eager, to descend from the airy realm of ideas to the humdrum world of actualities; be all out to produce something really workable and which will work well, and be a commercial proposition. Thought is necessary equally with action. One must be able to make up one's mind at the right time, and have the grit to carry the thing through.

It is never well, except under special circumstances, to show one's hand too soon. Extreme care should be taken not to inform the wrong party. If he be convinced that his idea or scheme is sound and valuable, a man should remember that his idea may be stolen, his scheme wrecked, if he entrust it to the hands of a time-serving intermediary. A note to the chief, outlining what the scheme is expected to do (not so much what it is), and asking for an interview, will in many cases ensure a fair hearing.

A caution is often necessary to such persons as are naturally of an impetuous and over-optimistic disposition. They should proceed carefully and thoughtfully. In their case it may well be good to curb the inclination to act impulsively. This is by no means contradictory to the injunction already insisted upon. A man must be able to act promptly at the right time. The psychological moment at times depends more upon the man than even upon the occasion. The over-cautious may need encouragement; often the ultra-confident man is all the better by reason of a little wholesome restraint. A creature of impulse must temper his nervous energy with that knowledge which is principally of himself.

"Fools rush in where angels fear to tread."

Men of real initiative, however, first face their problems fairly and squarely. They then seek a reasonable solution, and with great care satisfy themselves that it is at once workable, reasonable, and economical. After that they act. But there is no mistake about the quality of their action: it is decisive.

There is another essential characteristic which it is well to mention. A man must be prepared not only to act, but, where necessary, to act alone. He may seek advice; unless, indeed, he be the veriest fool, he will. But he never needs a prop. He should be most careful in his selection of friends and advisers, choosing men whose honour is irreproachable as their judgment is sound. He will be able to scrutinise his ideas in the light of their criticism. A true friend is a fearless but constructive critic; and his opinion is always well worth while. None can afford to stand severely aloof, least of all the proud sensitive man. All are the better for sincere, disinterested criticism. The real mark (perhaps that most distinctive of all) of the man of initiative is that, having probed the matter bone deep, having compared and, where necessary, corrected his own ideas by reference to the views of others equally competent, he then carries on, if needs must, single-handed, once the time for action arrives.

It is probably quite impossible to sketch in brief skeleton outline a process involved which shall be applicable to all cases. In general and fairly elastic terms, however, the cycle of events may not greatly depart from the hypothetical procedure suggested below.

A man goes about his daily work attentive to the demands of his own immediate task. If he be at all a keen man, and not off his beat, then he will think in terms not merely of his own bit, but he will seek to understand something of how his bit is related to that of his neighbour, and also how their joint contributions affect the entire product. Specially will he cultivate his powers of observation, strengthen his faculty for reflection and deduction. He will notice how the activities of one man dovetail into those of another, how inter-dependent are the various departments. Time and his own watchfulness will make him sensitive to defects, responsive to needs. Once he becomes conscious of either the one or the other, he will concentrate upon that. Half-an-hour's serious thought in his leisure time will often be sufficient to confirm him in his original opinion or to rebut it. Then he will apply himself to the remedy. He will examine most carefully the existing framework, as it were. Possibly only a faulty member needs replacing by one which will function effectively. At times it may be a radical change of design offers the most promising solution. As, however, he may well expect powerful opposition to too drastic a change, he will also explore the possibilities which offer by way of lesser innovations which possibly have more reasonable chances of survival. Thus he may devise two schemes.

Scheme A, which will improve matters, and be worth while, occasions the least interference with existing arrangements. It is conservative and relegates as little as ever possible to the scrap-heap. Scheme B, whose initial cost will be considerably greater than that of Scheme A, is practically an all-new design. The final results, however, are estimated to justify its adoption even by comparison with the alternative suggestion.

Then he will doubtless approach competent men whom he can trust and whose opinions are valuable. He will recall that adverse criticism, if kindly offered, is often of the utmost service. He will most probably modify his original drafts in virtue of the comments and suggestions so made. He will next think out most carefully how best to secure that his proposals are given a reasonable and impartial hearing. He should know the type of men in charge, and will approach the one whose sympathies and interests are all out for efficiency. He will carefully study his men, and seek not to transgress the canons of good taste and prudence. If the scheme be of that order of things he will probably already have taken the precaution of having it protected. He must expect that, unless he have himself prepared models, the management may suspend judgment until these are in hand.

Should his own employers prove unsympathetic, their competitors may be ready to negotiate. He will, of course, if he be wise, go over the various points again to satisfy himself that things are really as he wishes them to be. In that case, one rebuff need not place him *hors de combat*.

New Electric Fires.

Designs for the Coming Season.

As with books, of the making of many fires there is no end, and the opening of the heating season heralds the coming of many new designs of electric heating apparatus. As a general rule, the novelty lies not so much in the elements and the methods of distributing their heat as in the metal work in which they are embodied. There are, however, a few fires which depart somewhat from the hitherto accepted lines, as will transpire from the ensuing notes.

The market for electric fires is a growing one, for people are beginning to appreciate the worth of heat, without fumes or fuss, which can be obtained by the mere touch of a switch. In addition, electricity supply authorities are making electric heating possible by instituting special rates, and there is every prospect of continued expansion. Whether a wide variety of patterns is the best way of meeting the demand is perhaps questionable, but for the present we must take things as we find them, and confine our attention to a few examples of fires which are now being put on the market for the first time.

The Arora Co.

Among the fresh models which this firm has produced is the "Victoria" fire which is made with two or three 750-W bars. The three-bar pattern is illustrated in fig. 1. It has a handle for carrying purposes and two rotary switches, and is produced in three finishes—matt black, oxidised copper, or bright silvery white. The last finish is obtained by the provision of a non-corrosive metal in place of the more usual polished steel. The "Reflex" fire, shown in fig. 2, is another new design. This is constructed of sheet metal, with a bright silvery white finish, and wrought iron, and is said to give perfect reflected heat and direct radiant heat. It is 12-in. square in plan and has a height of 23 in. There are two 750-kW fire bars which are independently controlled. This fire is also made in a 3-bar pattern.

May & Padmore, Ltd.

Fig. 3 illustrates the "No. 10009" fire which is being made by the above company. It is of simple design with an antique brass front, embellished with a key pattern, and a hammered copper reflector. The company's standard 1,000-W fire bar is fitted. The fire only weighs 5 lb. and is 16 in. high, 11¼ in. wide, and 6 in. from back to front.

Electric Fires, Ltd.

The new patterns introduced by this company are principally developments of its "Electricoal" design, which, as will be inferred, employs imitation coal to obtain the psychological effect of the domestic hearth. The one illustrated in fig. 4 is modelled as a brazier with two fire-bars fitted in the front. To obtain the maximum effect the switches are put in an unobtrusive position. The loading can be either 2 or 3 kW as desired. The body has a black satin finish while the front and mouldings are brightly polished. Another example (fig. 5) has the "coal" arranged in the front, while the heating elements (1 or 2 kW) are fitted in the top at the base of a curved repoussé polished brass reflector. The elements are of the "plug-in" type, and the fire is obtainable in five different finishes.

Credenda Conduits Co., Ltd.

Among the new "Creda" electric fires are the "Wellwin" and "Unique" patterns. The former (fig. 6) is a handsome design, although utility has been the first consideration. It is intended to fill the space formerly occupied by a coal grate. There are three 1-kW elements and the switching arrangement enables one, two or three bars to be used as required.

Fig. 1.—The "Victoria" Fire.

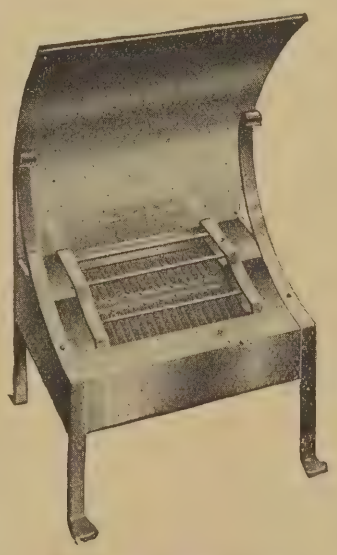

Fig. 2.—The "Reflex" Fire.

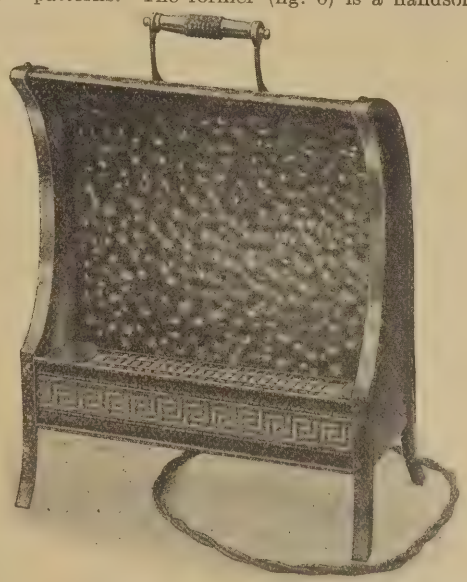

Fig. 3.—The "Maymore" Reflector Fire.

Fig. 4.—A "Heatrae Electricoal" Fire.

Fig. 5.—The "Electriglow" Fire.

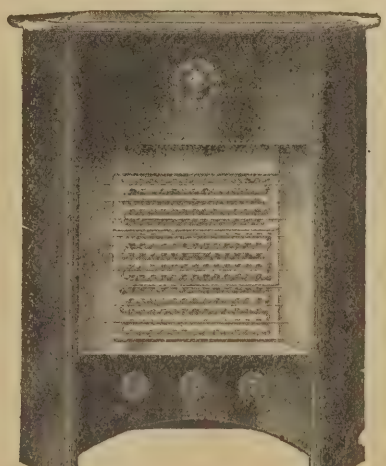

Fig. 6.—The Creda "Wellwin" Fire.

D

The body has a polished black finish and the fire bars are mounted in a polished copper "well" which reflects heat which would otherwise be absorbed by the body. The fire is 27½ in. high, 22½ in. wide, and 6 in. "deep"; it weighs 22 lb.

Fig. 7.—The Creda "Unique" Fire.

The other type, the "Unique" (fig. 7), seems to deserve its name. The heating element is in a concealed position at the top of the fire and the heat is reflected downwards on to a polished copper back giving a very fine effect. The flat top makes the fire suitable for keeping food, &c., warm. The loading of the elements is 2 kW in two equal sections. The fire has a weight of 27 lb. and a height of 16 in. Two kinds of finish are provided.

L. G. Hawkins & Co., Ltd.

This company has produced the "Blazor" fire (fig. 8) for the season. This is another example of the imitation coal pattern and it is combined with a reflector back of polished copper. The total loading is 2,250 W, but this is switched in two sections. The body is of heavy cast metal and is given an antique brass, oxidised copper, or polished aluminium finish. Its height is 21½ in. and its width 18½ in.

The Hotpoint Electric Appliance Co., Ltd.

Several fresh designs are being produced by this company one of them being a handsome Adam model (fig. 9). This is fitted with three 1-kW "knife-edged" refractory heating elements which are controlled by two foot-operated switches at the front of the fire. The body is of sheet metal and can be produced in any one of four finishes—electro-bronze, rustless steel, copper, or brass. Another fire by this firm is the "No. 160" pattern illustrated in fig. 10. This is primarily designed to fit into an existing fireplace. So far as the elements and their control are concerned the fire is very similar to the foregoing model. The usual finish is black, but any of the company's standard porcelain finishes can be executed. A smaller pattern of this type with only two fire bars is also manufactured.

Carron Company.

Fig. 11 depicts one of the latest of this company's designs, the "No. 256" fire. It is provided with two 1,000-W fire bars with well distributed wire elements. One or two bars can be switched on as required. The fire is 14 in. wide and 15½ in. high, and is supplied in four finishes, *viz.*, art black, armour bright, porcelain enamelled, and electro-bronze.

General Electric Co., Ltd.

Several new types have been added to the comprehensive range of "Magnet" electric fires produced by this company for the current season. A form of electric heater which is greatly increasing in public favour is the pedestal type, of which an illustration appears in fig. 12. It is a light pattern with black japan finish and a polished copper reflector. It is fitted with a special canting device, by means of which the reflector can be tilted and fixed at almost any angle, and the heat accordingly directed to any required position.

An entirely new pattern of radiator fire has also been produced. This fire (fig. 13) is constructed of polished brass and copper, and fitted with three helix elements, situated at the base. The control switch enables the heat to be regulated, and the design of the reflecting back plate ensures that the maximum heat is thrown forward.

Another model has an iron body with new-pattern grid elements vertically fixed. It is not only supplied in black matt finish, but also in oxidised copper or oxidised silver. Various period designs, Adam, Sheraton, &c., are also included in the new range of "Magnet" heaters.

(To be continued.)

Japanese Notes.

Electrification of the Central Railway.—The opinion is said to be gaining ground among the railway authorities that it would be more advantageous to electrify the Central Line instead of the Numadnu-Akashi section of the Tokaido Line, and this is likely to be realised. It was originally intended to completely electrify the Tokaido Line by the end of the fiscal year 1928-1929, to coincide with the completion of the Tanna Tunnel on the Atami Line, but the work of building of the tunnel has not made very satisfactory progress, and it is not expected to be completed as previously arranged. The opinion is held that electrification will be more effective on the Central Line, which has many steep gradients, than on the Tokaido Line, which is comparatively level. Moreover, on the Central Line coal is expensive and hard to obtain. It is proposed to take power from the Shinanogawa hydro-electric station.

Decline of Japanese Electrical Production.—The electric power industry having made marked development, foreign electrical machinery and apparatus have been imported in increased quantities, while their production in Japan has decreased and amounted only to 19,000,000 yen in 1923, as against 35,000,000 yen in 1912 and 20,000,000 yen in 1921. In view of this the Japanese Electrical Association is making exhaustive investigations into the possibilities of encouraging and reviving the industry.

The increase in the imports of foreign electrical machinery and apparatus is said to be due to technical progress and commercial activity, and the question of home production and the buyers' purchasing policies are likely to keep up a severe competition between the foreign and Japanese products and between the foreign products themselves. Of the foreign manufacturers, who are most extensively interested in the competition, we may mention Messrs. Mitsui & Co., agents for the General Electric Co. (America) and Messrs. Takata and Co., agents for the Westinghouse International Co., the latter, under new management, being practically as active as its predecessor. Messrs. Suzuki & Co. have lately entered the field as agents for the Metropolitan-Vickers Co., by taking advantage of an increased tendency to adopt steam instead of hydro power plant.

Power Plant Construction.—It is reported that the Kinugawa Hydro-Electric Company is installing an additional 8,000-kW set in its Sumida power station. The work is being pushed forward expeditiously with a view to completing it by March or April next.

The Nippon Denroku K.K. is constructing a hydro-electric power station on the upper part of the Jintsu River, Toyama Prefecture, which will house two 30,000-kVA generators. One of the generators has already been erected.

Electrification of Iron Works.—The electrification of various sections of the Government Yawata Iron Works is making satisfactory progress. The tinplate and flat steel works will be completely equipped with electrical plant shortly. At the same time a 7,500-kW power station will be completed, making the works' total output of power 42,000 kW.

An Electric Railway.—The Takarazuka-Amagasaki Electric Railway Co. was established at the beginning of 1924, with a capital of 3,000,000 yen, by persons interested in the Hanshin Electric Railway Co., for the purpose of laying an electric railway for a distance of 8¼ miles from Amagasaki to Takarazuka. The work of construction has not been commenced as official permission for it has not yet been obtained. Efforts are being made by the management to procure that permission.

Electrical Activity in Japan.—In a recent review of Japanese conditions, the United States Commercial Attaché at Tokio stated that inactivity continued in most import lines, the only notable exceptions being electrical equipment and steel products. In the electrical equipment market a considerable amount of business was pending, including substantial orders for generating units, switchgear, and railway motors. British competition was said to be increasing, one company having secured orders for more than 100,000 kW of generator equipment during July.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Electrical Commercial Travellers.—The Electrical Trades Commercial Travellers' Association is holding its first concert (Bohemian) on Saturday, October 10th, at 7.30 p.m., at the Manchester Hotel, London. The programme of subsequent events for the session has been issued and will be referred to in our next issue.

The Association held a well-attended general meeting on September 4th at the St. Bride's Institute. The chairman (Mr. C. W. Sully) referred to the continued growth and success of the Association and to the fact that already it had been able to give assistance to a member. The treasurer submitted the financial statement and the entertainment secretaries submitted details of fixtures for the winter. The vice-chairman, who had represented the Association at the British Commercial Travellers' Association conference, gave a full and interesting report of this conference to the meeting. The secretary for the newly-formed Employment Register, submitted his scheme for working, and at the same time appealed to all present to assist him in his arduous task by letting him have all the information possible that might be of help to him and the Association in this connection. The vice-chairman strongly recommended the commencement of a Sick Benefit and Thrift Society and offered his personal assistance to anyone forming a local branch. The annual meeting was fixed for November 13th.

New London Municipal Showrooms.—On Thursday next the electricity departments of two Metropolitan boroughs are inaugurating new showrooms and offices.

The Hackney undertaking is opening its new premises in Lower Clapton Road, the Committee having decided not to let labour troubles interfere with the ceremony. An article on these premises by Mr. L. L. Robinson, the borough electrical engineer, was published in our issue of June 13th, 1924 (p. 952).

Poplar is the other authority concerned, and in this instance Mr. J. W. Beauchamp, Director of the British Electrical Development Association, is to perform the opening ceremony. The date marks the 25th anniversary of the inception of the undertaking. The new premises are situated in Bow Road.

Oversea Trade Interviews.—Mr. J. H. Henderson, O.B.E., Commercial Counsellor at Rome, will shortly be visiting this country and will attend at the Department of Overseas Trade, 39, Old Queen Street, S.W.1, from October 12th to 16th. Mr. H. A. N. Bluett, Commercial Agent at Batavia, will also attend at the Department from October 5th to 16th. United Kingdom manufacturers or traders desirous of meeting these gentlemen will be able to arrange appointments by communicating with the Comptroller-General of the Department, quoting, respectively, the references 5935 T.G. and 943 T.G.

Wiremen's Strike at Hackney.—On September 23rd the wiremen employed by the Hackney Electricity Department in the wiring of its new showrooms and offices ceased work owing, it is stated, to the employment of a jointer who was not a member of the Electrical Trades Union. An endeavour was made to involve the whole of the electricians in the Sales Department, but this was unsuccessful. Notices have been tendered stating that the whole of the E.T.U. members employed in the generating, distribution and maintenance departments of the undertaking will cease work this afternoon (Friday), at 3 o'clock. Emergency action is being taken to keep the station running, but it is feared that a strike may delay the completion of the new premises.

E.D.A. Conferences.—The first of the conferences organised by the British Electrical Development Association for the 1925-26 Session takes place on Thursday, October 15th, at 7.30 p.m., at the E.L.M.A. Lighting Service Bureau. Mr. W. E. Bush will deliver an address on "Modern Lighting," and Mr. C. W. Sully will preside. As the accommodation is limited and the subject is a popular one, it is intended to hold a second session on the following night, when Mr. Bush will repeat his address, with Sir Hugo Hirst, Bart., in the chair. We shall publish particulars of the complete programme of the session in our next issue, but it is important that our readers should note that for the events of October 15th and October 16th they must make personal application for tickets, stating on which of these two dates they desire to use them. Letters should be sent to the Association at 15, Savoy Street, Strand, W.C.2.

Road Transport Lectures.—A course of twelve lectures on various phases of modern road transport operation is to be given at the London School of Economics and Political Science, in co-operation with the Institute of Transport. The lectures will be delivered by well-known members of the transport industry on Wednesday evenings, commencing on October 28th.

Unemployment.—A further decrease in the number of unemployed was shown by the Employment Exchange registers on September 14th, the total at that date being 1,327,700, as compared with 1,345,455 a week earlier and 1,163,950 on September 15th, 1924. The Ministry of Labour is inaugurating an experimental scheme for the training of unemployed young men in various trades. Four centres are to be established.

Award for Petter Oil Engines.—Messrs. Petters, Ltd., of Yeovil, have received a communication from their Portuguese agents, Fabricas Vulcano e Collares Carlos Alfredo da Silva, Ltd., of Lisbon, that at the recent Caldas da Rainha Exhibition another gold medal was awarded to the "Petter" oil engine exhibit.

E.L.M.A. Illumination Design Course.—The Electric Lamp Manufacturers' Association has decided to hold its seventh illumination design course towards the end of the current month. The course, which is intended for contractors and wholesalers, will commence on October 27th and run for four days. As far as time permits, the course will cover the whole field of electric lighting from the making of lamps to the latest devices employed in the art of illumination.

Municipal Trading.—The subject of municipal retail selling was discussed on Monday this week at a meeting of the Council of the Birmingham Chamber of Commerce. The Retail Section Committee, in a report, recalled the action that the Chamber took some years ago to oppose the sale of electrical fittings by the Birmingham Electric Supply Department, with a successful result. In the last eighteen months the Corporation had opened a new showroom in Paradise Street for the sale of electrical fittings of all kinds. In response to representations made by the Electrical Contractors' Association, the Department agreed to allow its members a considerable discount on any sale, introduced by them, or on fittings fixed by them which had been bought direct by the consumer, and the Retail Section, many of whose members stocked portable apparatus, such as vacuum cleaners, electric fires, lamp shades, electric irons, &c., asked that they should not be subject to this competition by the Corporation, where it could be shown that they were *bona-fide* dealers in the articles stocked, unless at least they had the same allowance on introduction of customers as that enjoyed by the electrical contractors. Such a system was already in operation in other towns, and with rent and rates so high, the Retail Section contended that the municipality should not enter further into trading, but should confine its attention to furthering the supply of electricity. The Retail Section expressed regret that representations which it had made to the Department with a view to fair treatment for all classes of traders had been ignored. It asked the Chamber to help it to get the matter further considered. It was decided to give this support.

Social Event.—On September 12th, the whole of the employés of the Loughborough Corporation electricity works were present at a social evening which was held at the Great Central Hotel. The Mayor and other members of the Corporation were present, and an excellent entertainment was provided. A vote of thanks was accorded to Mr. R. B. Leach, the borough electrical engineer, for arranging the function.

Trade Announcements.—Messrs. W. & T. Lock, of Bath, who were the manufacturers of cabinets distributed by Messrs. Henry Joseph & Co., Ltd., now in liquidation, inform us that they are continuing the production of these cabinets under their own name. Mr. Henry Joseph has been retained as representative for London and the Southern and Eastern Counties, and he will have offices and showrooms at 96, Victoria Street, London, S.W.1.

The Autocar Electrical Equipment Co., of Mitchell Street, London, E.C., has been appointed service agent and depôt for spare parts and repairs to E.A. electric horns and windscreen wipers.

Mr. H. E. Mayhew, 5, Billiter Buildings, Billiter Street, London, E.C.3, has been appointed sole agent in the London district for Sir William Arrol & Co. (Swansea), Ltd., who manufacture structural steel work of all descriptions at Swansea.

Mr. Albert Illing has been appointed manager of the business of C. A. Vandervell & Co., Ltd., in Yorkshire, Cheshire and Lancashire. A C.A.V. depôt is shortly to be established in Manchester.

Messrs. W. G. Perry & Co., Ltd., have moved to 13, Whitcomb Street, Pall Mall East, W.C.2. Telephone: "Regent 1426."

Messrs. B. & G. G. Bell have commenced business in Lowther Street, Whitehaven, as electrical engineers.

Catalogues and Lists.—The Metropolitan-Vickers Electrical Co., Ltd., Trafford Park, Manchester.—Descriptive Leaflet No. 71/8-1, dealing with liquid controllers with an automatic acceleration device for a.c. slip-ring motors.

Swedish General Electric, Ltd., 5, Chancery Lane, W.C.2.—Two illustrated pamphlets describing refrigerating plant made by the Century Electric Co. (United States).

The Kango Co., Ltd., 78, Petty France, Westminster, S.W.1.—An illustrated pamphlet describing the "Kango" electro-mechanical hammer.

Engineering and Lighting Equipment Co., Ltd., Sphere Works, St. Albans.—Two illustrated and priced folders advertising "Interzone" reflectors for shop-window lighting, and "Lunax" lighting units.

Messrs. Bruce Peebles & Co., Ltd., Edinburgh.—A reprint from the Electrical Review, dealing with the conversion of the Eskbank carpet mills of Messrs. Stewart Bros., to electric drive.

Autoveyors, Ltd., 82-84, Victoria Street, S.W.1.—A series of pamphlets dealing with "Clix" connectors, "Radio Condit," spiral and bridge condensers, &c.; illustrated and priced. Also a cardboard panel for demonstrating "Clix" connectors and "Radio Condit."

Veritys, Ltd., Aston, Birmingham.—Publication No. 988, a priced and illustrated catalogue of "Maxlume" lighting equipment for commercial, industrial and street-lighting applications.

The British Thomson-Houston Co., Ltd., Crown House, Aldwych, W.C.2.—Pamphlets dealing with (*a*) "Mazda" electric lamp outfits for decorative purposes; (*b*) the B.T.-H. table-lamp loud speaker; and (*c*) automobile electric lamps. Illustrated and priced.

Messrs. Blackstone & Co., Ltd., Stamford.—Publication No. 374, a booklet containing particulars and illustrations of various types of "Blackstone" oil engines.

Bruntons, Musselburgh, Scotland.—An illustrated booklet describing "Tru-Lay" wire rope and "Tru-Loc" fittings.

Messrs. L. Andrew & Co., 2, Whitworth Street, Deansgate, Manchester.—A priced pamphlet advertising "Wrendal" metal-filament and "Capella" carbon-filament electric lamps.

Mr. E. Rutherford Palmer, 40½, Bristol Street, Birmingham.—A booklet containing illustrated details of "Star" and "Eve" reflectors for interior and exterior lighting. Priced.

Cryselco, Ltd., Kempston Works, Bedford.—A catalogue and a series of pamphlets dealing with "Cryselco" opal-type lamps; and a brochure containing notes on interior and street lighting.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—Catalogue Section H (3), containing illustrations and descriptions of the company's heavy electric cooking equipment.

W. T. Henley's Telegraph Works Co., Ltd., Holborn Viaduct, E.C.1.—An illustrated and priced pamphlet dealing with "Isco" service cut-outs.

The Constructional Engineering Co., Ltd., Titan Works, Charles Henry Street, Birmingham.—Pamphlet No. 138, containing an illustrated description of the "Titan" steel barrow.

The Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester.—A priced and illustrated catalogue of secondary batteries for radio purposes. An appendix sets forth the characteristics of many makes of valves; explains the method of choosing a battery and rheostat, and gives notes on the care of batteries.

The Economic Electric, Ltd., 10, Fitzroy Square, W.1.—An illustrated catalogue of radio apparatus of all kinds.

Pope's Electric Lamp Co., Ltd., 5, Arthur Street, New Oxford Street, W.C.2.—A pamphlet advertising "Elasta" electric lamps.

Bankruptcy Proceedings.—J. E. Wild, Bark Street, Bolton, engineer and wireless merchant.—The public examination of this debtor was held at Bolton Bankruptcy Court, on September 23rd, the statement of affairs showing liabilities of £1,236, and a deficiency of £1,016. The debtor commenced the Bolton business in 1923, and was very successful up to last May. He then took up a new receiving set which was being placed on the market. It went well until the Wireless Telegraphy (Amendment) Bill was introduced. The sales for the week previous to the Bill were £150. In the succeeding week they dropped to £20. His overhead expenses for advertising, &c., averaged £28 to £30. The Bill had caused a slump just when he had got his set into the hands of wholesalers. The Deputy Official Receiver said that he could not credit the story that the threat of a Wireless Bill stopped the sale of this set and caused the failure. Wild said it was not the sale of this set only but the sale of most wireless sets which was interfered with. The examination was closed.

F. J. Tizzard and N. Tizzard, 102, West View Road, Barrow, carrying on business at Barrow and Dalton-in-Furness, under the style of Tizzard Brothers, electrical engineers and contractors.—These debtors appeared for their public examination at the Barrow Bankruptcy Court, on September 25th. The gross liabilities were £476, of which £425 was expected to rank and the deficiency £263. The failure was attributed to the loss on the Dalton shop and a bad season in Barrow. The examination was closed after the debtors had been questioned.

J. G. Penman, electrical engineer and contractor, 37, Bath Street, Glasgow.—A dividend is payable on November 2nd, at the offices of Messrs. Dunlop & Murray, 188, St. Vincent Street, Glasgow.

C. E. F. Parker, electrical engineer, Greendale, Privet Road, Gosport.—First meeting, October 5th, at the Official Receiver's office, 87, High Street, Portsmouth. Public examination, November 2nd, at the Court House, Portsmouth.

P. L. Symonds, electrician, 4, Nelson Road North, and 4, Victoria Road, Great Yarmouth.—Last day for proofs for dividend October 17th. Trustee, Mr. C. B. L. Prior, Official Receiver, 9, Queen Street Chambers, Norwich.

H. Parr, electrician, 2, Strawberry Dale Square, and 1, Back James Street, Harrogate.—Trustee, Mr. W. A. Thompson, 11, King's Road, Harrogate, released August 19th.

S. L. Babty and N. Miles (Wireless Instrument Manufacturing Co.), wireless instrument manufacturers, Avenue Works, Avenue Road, Willesden Junction, N.W.—Last day for proof for dividend, October 7th. Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C.

F. P. Crawley, electric, radio and motor-car engineer, 6, Darwen Street, Blackburn.—Last day for proofs for dividend October 9th. Trustee, Mr. A. T. Eaves, 47, Mosley Street, Manchester.

Company Liquidations.—Robins Wholesale Electrical and Wireless Co., Ltd., Fanny Street, Cardiff.—A further meeting of creditors was held recently. At the statutory first meeting of creditors a statement of affairs was submitted by the liquidator, Mr. S. E. Clutterbuck, 31, Queen Street, Cardiff, disclosing liabilities of £4,261 and net assets of £595, leaving a deficiency as regarded the creditors of £3,666. The issued capital amounted to £999. It appeared that the debenture holder had appointed a receiver, who was in possession of the assets. At the further meeting of creditors it was resolved that the creditors should recommend the continuance of the voluntary liquidation with Mr. Clutterbuck as liquidator and that he should be instructed to make a close investigation into the whole dealings of the company. It was also decided

hat the creditors should be asked to contribute in cash to he costs of the investigation on the basis of 5 per cent. on he amount of the account of each creditor. An advisory committee was also nominated consisting of Messrs. Corfield and Cripwell, Birmingham, Mr. C. J. Neale (Siemens & English Electric Lamp Co., Ltd.), Mr. T. Ridout (General Electric Co., Ltd.), the Marconiphone Co., Ltd., and Messrs. Popple-on & Appleby, of Birmingham.

Milligan's Wireless Co., Ltd., Sauchiehall Street, Glasgow.—A meeting of creditors was held recently, when a statement of affairs was submitted which showed liabilities of £2,388, all due to unsecured creditors. The net assets were given as £344, leaving a deficiency of £2,044. The company was incorporated in 1923, with a share capital of £3,525, to take over an existing business. Capital to the extent of £1,000 was subscribed in cash, and the balance was represented by the purchase price of the business, plus £500 goodwill. The company was originally in premises in Renfield Street, but were obliged to remove to their present address, which cost them a considerable sum, and also disorganised their business for a time. The following year a branch was opened in Bath Street, which venture proved disastrous. It appeared that large losses had been incurred every year on bad debts. Loss due to fire amounted to over £600, but the company had difficulty in proving the loss to the insurance company owing to the absence of a stock book. It was decided to confirm the voluntary liquidation of the company, with Mr. E. S. McFarlane, C.A., 53, St. Vincent Street, Glasgow, as liquidator, while an informal committee was also nominated.

Tele-Dis Services (Founders' Co)., Ltd.—The liquidator, Mr. G. D. Pepys, reports that the liabilities of this company, which was organised to carry on a telephone-disinfecting service, amount to £17,856, and the assets to £94. Thousands of contracts were entered into all over the country. The company's failure is attributed to the heavy advertising expenses, cost of distribution of products, lack of capital, and the general depression in trade.

P.S. Wireless Manufacturing Co., Ltd.—Particulars of claims to be sent by October 31st to the Liquidator, Mr. E. Webb, 34, Grand Parade, Brighton.

Private Arrangements.—S. C. Coley, trading as the Torbay Electrical and Wireless Co., 23, Victoria Parade, Torquay, wireless and electrical engineer.—The creditors interested herein were called together recently at the offices of Messrs Ware, Ward & Co., Torquay, when it was stated that the total liabilities were £2,980. The net assets were valued at £310. It was reported that the debtor commenced business in April, 1924. He had no capital, but obtained a guarantor to the bank, and that guarantee was still in existence for the full amount of the bank overdraft. Debtor had from time to time had balance sheets prepared, and on each occasion substantial losses had been shown. The deficiency was accounted for by loss on trade, debtor's drawings, and depreciation. Debtor was not in a position to submit any offer to the creditors, but the gentleman who was the bank guarantor and also a cash creditor consented to discharge the bank overdraft and withdraw his own claim against the estate on condition that the creditors agreed to a deed of assignment. The creditors resolved that, subject to the bank's claim and the cash claim not ranking for dividend, the debtor should be requested to execute a deed of assignment to Mr. Arthur Collins, C.A., Torquay, as trustee, with a committee of inspection.

R. H. Welsh, electrical engineer, Exeter Road, Bootle.—A meeting of creditors was held recently at the office of Mr. J. H. Hort, I.A., Liverpool, when a statement of affairs was presented which showed liabilities of £310, all due to unsecured creditors. The assets were estimated to realise £144, leaving a deficiency of £166. It was reported that the debtor commenced business in October, 1922, with £50 capital, borrowed from his father, of which £40 had since been repaid, and capital of his own amounting to £93. Complete books of account had not been kept, and no details of the turnover were available. It was decided to adjourn the meeting to enable the debtor to approach his father with a view to the latter's making an offer of 10s. in the £ to the creditors. At the resumption of the meeting it was reported that certain moneys had been handed over, and it was now possible to assure the creditors a composition of 10s. in the £, payable as to 5s. in cash and 5s. in three months. The offer was accepted, and the deed of assignment already executed in favour of Mr. J. H. Hort, 24, St. Thomas Street, Liverpool, was confirmed.

Dissolutions of Partnership.—P. Vaughan & Co., electrical engineers, 57, Fetter Lane, E.C.—Mr. S. P. Storey and Mr. W. H. Matthews have dissolved partnership. Mr. Storey will attend to debts and continue the business under the same style.

Royal Accumulator Co.—Mr. W. Johnson and Mr. J. Ingham have dissolved partnership. Mr. Johnson will attend to debts.

North Wilford Power Station.—We are informed that nine "Maxtorq" totally-enclosed squirrel-cage motors, of 75 b.h.p. at 720 r.p.m., were supplied to the Nottingham Corporation by the Lancashire Dynamo & Motor Co., Ltd., to drive the coal crushers; two of them appear in fig. 7, p. 460, of our description of the North Wilford power station. The a.c. machines driving the fans (fig. 6, p. 460) were also supplied by this company, in connection with Messrs. Davidson & Co.

British Manufacturers and Australian Tariffs.—The Sydney (N.S.W.) correspondent of the *Daily Telegraph* states that a recent meeting of the Australian Association of British Manufacturers and representatives directly concerned with the interests of British trade with Australia, passed a resolution stating that, while fully appreciative of the advantages accruing to British trade from the Commonwealth Government's maintenance of the principles of preference in the recent tariff proposals, the high duty on articles affecting the textile and engineering trades proved a serious blow to British trade in general with Australia. The Association felt that the increased tariff on British goods would prove an obstacle to further inter-Imperial relationships. It suggested that consideration should be given to the question whether relief could be granted to British trade.

A New Phase in Show-window Illumination.—The modern shopkeeper has long realised that good window lighting is a most effective form of advertising, and for some time past the managements of well-known shops and stores have adopted higher intensities of light for the illumination of their show windows. It may be said, however, in this direction that Messrs. Canda, Ltd., of Oxford Street, have created a precedent in show-window illumination. The illustration herewith is from a photograph of a window in their new Oxford Street emporium, taken by the window lighting alone, at midnight. The excellent illumination is the result of a system of lighting

The Lighting of an Oxford Street Show Window.

combining "Gecoray" reflectors and 500-watt bowl-sprayed white "Osram" gasfilled lamps. It is claimed that this is the first time in the history of illumination in this country that 500-watt gasfilled lamps have been used on a large scale for this purpose in individual silvered-glass reflectors. Before the high-wattage lamps were permanently installed in this establishment, exhaustive tests were carried out upon a number of "Gecoray" reflectors, designed to accommodate either 300- or 500-watt gasfilled lamps, with a view to determining whether they would successfully withstand the additional heat generated. The results of the tests proved that the reflector was entirely unaffected by the heat, and that it did not crack, peel, or tarnish.

From the crowds of pedestrians who gather nightly round the windows of Messrs. Canda, Ltd., it is apparent that not only is the beauty of the displays enhanced by the use of the high intensity of light, but that light as "The Silent Salesman" is more than justifying itself. It should be particularly noticed that shadows are totally eliminated. The consulting engineers in connection with the work were Messrs. Albion T. Snell & Partners, and the electrical work of the whole installation, as well as throughout the interior, showrooms, &c., was carried out by Messrs. Francis Polden & Co., Ltd., who are to be congratulated upon the excellence of their work in connection with this notable achievement.

New Indian Company.—The Shree Bhawani Maratha Mills & Electricity Supply Co. is a combined textile-manufacturing and electricity supply company recently formed at Barsi with a capital of 15,00,000 rupees.

The Salonica International Fair.—This Fair, which was to have been held during the current year, is to be held from May 15th, 1926, for a period of two or three weeks. Applications for space, &c., should be made to the Fair offices, 11, Papakiriazi Street, Salonica, by January 15th next.

Chinese Electrical Notes.—The *Chinese Economic Bulletin* states that the imports of electrical materials and fittings during 1924 were valued at 4.22 million Haikwan taels (£772,000 approx.). The slight decrease from the previous year's figure is considered to be due to the lower prices engendered by competition. Trade in this class of goods is well maintained, although competition is severe. The discontinuance of bulk supplies from the Shanghai municipal power station, during the recent strike, involved the shutting down of 1,425,000 spindles in cotton mills.

The Question of Government Aid for Industry.—The following comments appearing in *The Times* editorial City Notes, and discussing "the industrial perspective" and "Limits to Government Action," are worthy of consideration by all our readers:—"In opening the Motor-cycle Show at Olympia, Sir Burton Chadwick, M.P., Parliamentary Secretary to the Board of Trade, drew a picture of the industrial situation with a better sense of perspective than some of our industrialists are prone to do. He did not deny that there was grave cause for the gloomy forebodings of those engaged in some of our most important unsheltered industries; but the motor-cycle industry was not one of them. The history of that industry since the war was a fine story of enterprise, ingenuity, pluck, and good British workmanship. It had recovered its competitive power in oversea markets, especially in Australia. In 1920, he pointed out, Great Britain exported 21,000 motor-cycles and America 37,600. In 1924 that position was completely reversed: Great Britain exported 37,000 and America 16,800. This showed that the industry, which was fully employed, had by its own efforts worked with such purpose that its product was supreme in the home market, and was rapidly ousting its competitors in the foreign markets. It was not a case of 'muddling through,' but of carefully-thought-out plans, unremitting hard work, and co-operation amongst all concerned. No one will deny that this is the best basis on which to build up the supremacy of any industry. It conforms to Nature's law of the survival of the fittest. When things go badly, many people are apt to clamour that the Government shall do something. All experience goes to show that legislation has done more to hinder trade than to assist it. The main function of Government is to keep law and order, to look after the foreign affairs of the nation, and to administer with the utmost economy the nation's finances. The Government is not in a position to know a business as well as those engaged in it. Consequently, unless there is virtual unanimity as to the merits of a particular legislative project put forward by those engaged in a particular industry, the Government must act warily and with great caution. Even when unanimity is present the Government has to assure itself that by passing legislation with the object of benefiting one industry, it will not be doing more harm in the aggregate to others."

The Metric System in Argentina.—The Argentine Ministry of Agriculture has sent a notice to public auctioneers calling their attention to Article 18 of the regulations supplementing the law governing weights and measures in Argentina. This article provides that "persons who, in private contract, in books or commercial documents, public placards, or advertisements, employ denominations of weights and measures not authorised by the law shall be punished by fine." This article therefore prohibits the use of weights and measures not comprised in the metric system. *Commerce Reports* says that although this notice is addressed to auctioneers, it would seem applicable as well to manufacturers' catalogues. No ruling has yet been published as to the use of other measurements in cases where the metric equivalents are shown, but it is probable that no objection will be made if both units appear.

Threatened Tramway Strike at Salford.—The dispute at Salford regarding the employment of non-unionists in the Tramway Department was settled last week, the remaining man concerned having agreed to join the Transport and General Workers' Union.

Russian Electrical Imports.—A German commercial newspaper states that the imports of electrical goods into Russia during the five months from October, 1924, to February, 1925, were valued at 3,821,000 gold roubles, as compared with 1,936,000 roubles in the equivalent period of 1923-24. Included in this total were dynamos and motors, 756,000 roubles (as against 326,000); electrical appliances, 1,980,000 roubles (783,000 roubles); and incandescent electric lamps, 1,085,000 roubles (827,000 roubles). Germany's share of the total was valued at 2,117,000 roubles, as compared with 1,831,000 roubles.

Local Exhibitions.—Salford.—The exhibitors participating in the Salford Corporation electrical exhibition which concluded on September 24th were:—The British Electric Transformer Co., Ltd.; the British Thomson-Houston Co., Ltd.; the Edison Swan Electric Co., Ltd.; the Jackson Electric Stove Co., Ltd.; the Metropolitan-Vickers Electrical Co., Ltd.; the General Electric Co., Ltd.; the Hotpoint Electric Appliance Co., Ltd.; and Messrs. Ward & Goldstone, Ltd.

A radio exhibition was held at the Philharmonic Hall, Liverpool, last week, concluding on Saturday last. A comprehensive display of radio sets and components was arranged, and the public was permitted, by the courtesy of the B.B.C., to inspect the latest type of microphone used for studio work. The Liverpool Wireless Society explained and demonstrated the actual construction of wireless sets at one stall, and at another were sets made by the members. Altogether there were 26 stalls, in addition to the Wireless Society's workshop. The main trade exhibitors were:—C. Lucas (Hobbies Dept.); Jake Graham; Liverpool Radio Supplies; M. Stanley & Co.; Central Electrical and Radio Co.; F. H. Middleton; F. W. Mason; S. G. Brown, Ltd.; Sefton Electrical Co.; Brown Bros.; the British Radio Manufacturing Co.; Sel-ezi Wireless Supply Co., Ltd.; Walter C. Barraclough; James G. Ivory; John Banks & Sons; John Gaunt; F. D. Phillips; Makerimport Co.; J. D. Wireless Co.; Harding, Holland & Fry, Ltd.; the Silvertown Co.; the Wireless League, Liverpool; Radiovim, Ltd.; and the Gil-Ray Trading Corporation.

Fleetwood.—A successful exhibition of electric cookers and domestic appliances was held at Fleetwood last week. The results were good, orders being booked for 104 cookers, in addition to radiators and grills. It has been decided to arrange another exhibition next autumn.

Leicester.—At the All-Electric Exhibition which is to be held in the Junior Training Halls from October 8th to 17th, there will be a special display of good and bad lighting methods organised by the Electrical Association for Women. The fittings, we understand, have been arranged in co-operation with Mr. Beauchamp, of E.D.A. and the E.L.M.A. Lighting Service Bureau. On the opening day, Miss F. Hodge, of the E.L.M.A. Bureau, will lecture on "Home Lighting," and during the whole of the following week commencing from Monday October 12th, Miss Margaret Partridge will give a lecture each afternoon, with demonstrations on the following subjects:—The Live Wire—Mending fuses, &c.; What Electricity can do; Cooking by Electricity; Electric Radiators; and The House Without a Servant. The lectures have been arranged in co-operation with Mr. Smith, the city electrical engineer.

The Shannon Scheme Dispute.—Work has not yet commenced upon the Shannon hydro-electric scheme owing to the refusal of Messrs. Siemens Schuckert, the contractors, to pay the rates of wages demanded by the Irish Transport Workers' Union. The union rate for unskilled labour is 1s. 1d. per hour for a week of 48 hours, whereas the contractors offered 8d. per hour for a 50-hour week. A later offer by the firm provides for a flat rate of 32s. for a 50-hour week, with free quarters, and food at special prices.

New Zealand's Electrical Imports.—In a review of the imports of New Zealand during the first half of the current year, the *Board of Trade Journal* states that while the United Kingdom increased its business in a number of directions it lost ground considerably to the United States in, *inter alia*, electrical machinery and appliances. The actual figures are not yet available.

British Trade Mark Applications. — The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from September 23rd.

The Snake (lettering and design). No. 457,000. Class 8. Induction coils for use in radio-telephony and telegraphy.—R. V. Langbart, trading as the London Wireless Co., 3, London Road, Liverpool.

Tangent. No. 458,044. Class 8. Inductance coils, coil holders, rheostats, low-frequency inter-valve and telephone transformers, high-frequency transformers, variable and fixed condensers, thermionic valve holders, grid leak resistances, headphones, primary cells, crystal receivers and parts, all being apparatus or components of apparatus for use in radio-telegraphy and telephony. Pul-Syn-Etic-Electric (lettering and design). No. 460,983. Class 10. Electrical horological instruments.—Gent & Co., Ltd., Leicester.

Narron. No. 458,708. Class 8. Radio-telephonic instruments and apparatus, namely, rectifiers, detectors, condensers, telephones, loud speakers, amplifiers and electric gas discharge tubes. No. 458,709. Class 13. Electric incandescent lamps and their parts, electric light fittings, lampholders, and reflectors. No. 458,710. Class 16. Glass reflectors and globes.—Osram Gesellschaft, 11-14, Ehrenbergstrasse, Berlin, O.17. (British representatives Cruikshank & Fairweather, 65-66, Chancery Lane, W.C.2.)

Etherplus (lettering and design). No. 460,173. Class 8. Instruments and apparatus for use in connection with radio-telegraphy and telephony.—M. and A. Wolff, 9-15, Whitecross Street, E.C.1.

Hawk (lettering and design). No. 451,078. Class 8. Radio-telegraphy apparatus.—The Hawk Co., Ltd., St. Mary's Road, Surbiton.

Minstrel. No. 461,388. Class 8. Instruments and apparatus for use in connection with radio-telegraphy and telephony.—S. H. Taylor, 39, Hillmarton Road, Holloway, N.7.

Reltak. No. 461,264. Class 13. Terminals for electric lampholders, lamp sockets, and electric light fittings.—Mycromet Manufacturing Co., Clydesdale Work Street Works, Copsterhill Road, Oldham.

Magiclog. No. 459,486. Class 16. Electric fires.—Berry's Electric Co., Ltd., 85-86, Newman Street, W.1.

For Sale.—Worcester Corporation invites offers for two 95-h.p. Crossley gas engines and suction gas producer plants; Taunton Corporation Electricity Department, owing to change of system of supply, has for disposal surplus generating plant, &c. Messrs. H. Butcher & Co. will sell by auction on October 28th, at the London Auction Mart, Queen Victoria Street, E.C., valuable waterside properties situated at Stratford, E. Hull Corporation Electricity Committee invites offers for surplus generating sets. (See our advertisement pages to-day.)

Irish Free State Electrical Imports.—The imports of electrical goods and apparatus—excluding dynamos, motors, and other electrical machinery—during June last, amounted to £24,308, as compared with £27,126 in the similar month a year ago. The returns for the first six months of the year show a total of only £159,144, as compared with £216,902 in the corresponding half of 1924.

The Swiss Radio Industry.—Steadily increasing interest is being shown in radio-telephony and broadcasting in Switzerland. So far the bulk of the receiving sets in use have been imported but a home wireless industry is gradually being built up. One of the principal Swiss manufacturers is the Société Televox, of Neuchatel, which, in addition to two-, three-, and four-valve sets, is producing transformers and variable condensers. Apparatus under Marconi licences is also being turned out by Favarger & Co., of Neuchatel. The Fabrique Suisse d'Isolants, of Bretonbac, manufactures all classes of enamelled and bare wire and various insulating materials. The Société des Câbleries et Trefileries, at its works at Cossonay, turns out wires and cables from the smallest to the largest size, while the Société Leclanché, of Yverdon, is specialising on primary batteries for dull-emitters, h.p. batteries and condensers, the last being a class of goods which the company has supplied for many years to the Swiss telephone and telegraph authorities. Finally, it may be mentioned that the H. Weidmann Co., of Rapperswil, has a speciality in "Cornite" moulded insulation for valve sockets, &c.

Book Notices.—"The Electrical Contractors' Year Book, 1925-26." (Pp. 376.) London: The Electrical Contractors' Association (Inc.). Price 5s.—Apart from the doubling of the price, there is little change in this issue as compared with that for 1924-25, except in such matters of detail as must always be attended to in annuals of this kind. The legal section has been slightly revised and re-entitled "The Law of a Consumer's Right to the Supply of Electricity."

"Electro-Farming."—We have received copies of the first four issues of "Electro-Farming," a new monthly journal which has been started to deal solely with the application of electricity to agriculture and to rural industries. It is claimed that this is the only journal of the kind in existence, "although nearly a million farms use electricity." The editor is Mr. R. Borlase Matthews, Wh.Ex., whose experience both as an electrical engineer and as a practical farmer, combined with literary ability and enthusiasm for his subject, admirably fits him for the post. The purpose of the journal is "to record progress, to lead to improved methods of construction, and to stimulate the interest of both farmer and engineer in rural electrification." The first issue (dated June, 1925) contains articles on "Haymaking without Sunshine," "Wireless and the Farmer," "Electricity in the Farm Buildings," "Electric Ploughs for Small Fields," &c.; in later issues, in addition to electrical features, articles of general interest to farmers are inserted, and the standard set up in the first issue is more than maintained. Those who know the editor will not be surprised to learn that the decimal system of filing cuttings is described, and provision is made in the journal to facilitate filing, the classification reference number being printed at the head of each article. The journal is issued by Electrical Press, Ltd., price 4d., and should prove of great assistance in furthering the use of electricity in the country.

"High-Voltage Testing Equipments (1,000,000 V)," by E. T. Norris, A.M.I.E.E. (pp. 8; 6 figs.). Hollinwood (Lancs.): Ferranti, Ltd.—This brochure illustrates and describes the method of obtaining test pressures up to a million volts by use of three transformers in cascade. The construction of the transformers is detailed, and illustrations are given of million-volt arcs and discharges.

"Science Abstracts" (A and B). Vol. XXVIII. Part 9. September 25th, 1925. London: E. & F. N. Spon, Ltd. Price 3s. each.

"High-Tension Line Practice," by E. V. Pannell. Pp. xv+277; 124 figs. Price 22s. 6d. net. "The Principles of Sound Signalling," by M. D. Hart and W. W. Smith. Pp. 139; figs. 12. Price 12s. 6d. net. London: Constable & Co., Ltd.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLIV. No. 9. September, 1925. New York: The Institute. $1.

"The Elements of Internal-Combustion Engineering," by T. Petrie. Pp. xi+236; figs. 61. Price 10s. 6d. net. "Photo-Electricity," by H. S. Allen. Pp. vi+320; figs. 43. Price 18s. net. London: Longmans, Green & Co., Ltd.

"Wireless Questions and Answers," by P. J. Risdon. Pp. 92. London: W. Foulsham & Co., Ltd. Price 1s. net.

Lead.—Reporting on September 26th, Messrs. James Forster & Co. stated:—"The general position is unchanged. There is still an acute shortage of prompt lead, which threatens to become worse next month, when the full effect of the shipping strike in Australia and South Africa is felt. The future of the market is difficult to read, as it is impossible to say what effect the settlement of the strike will have on prices. Although consumption is still large, particularly in the electrical trades, there is an indication that the home trade is not so busy. Consumption in Germany also is falling off, while in America the position is easier and forward lead is on offer. We still think that consumers should adopt a precautionary attitude, as a backwardation of over £3 a ton can hardly be regarded as healthy."

Electric Steel Production in Brazil.—The electrometallurgical works at Libeirao Preto (Sao Paulo) are nearing completion. The necessary electric power will be supplied by a hydro-electric works at Rio Mojos. The works will have a production of 60 tons of steel per day.

New Swiss Company.—A new company has lately been organised in Berne with the title Die Bern Radiogenossenschaft, to establish a new broadcasting station in that city.

Lighting and Power Notes.

Adwick.—Electricity Scheme Progress.—Under the Council's electricity scheme now nearing completion, a bulk supply will be taken from the Brodsworth and Bullcroft colliery companies. The Council's charge for lighting will be 5d. per kWh. A charge applicable specially to tenants of houses belonging to the colliery companies and to the Council will be made at the rate of 1s. 6d. per week for five points and 1s. 7½d. for seven points.

Australia.—Victoria.—Construction work on the transmission line from Melbourne to the Sugarloaf-Rubicon hydro-electric project of the Victorian State Electricity Commission is nearing completion. Until the hydro-electric works are completed, the line will be used for supplying electricity from Yallourn to the towns in the North-Eastern district of Victoria. Tenders will shortly be invited for the supply of plant for the hydro-electric project, and within two months it is expected that further tenders will be called for the construction of the water-races, pipe lines, and other works. The Sugarloaf-Rubicon scheme provides for the installation of generating plant with a total capacity of 40,100 h.p. The plant will be installed in the following six power houses:—Sugarloaf, 18,000 h.p.; Snobs Creek, 5,100 h.p.; Lower Rubicon, 3,600 h.p.; Rubicon, 12,000 h.p.; and two smaller ones at Royston and Rubicon Falls. The combined power houses will supply all the towns in the North and North-Eastern parts of Victoria and some of the New South Wales border towns.—*Reuter's Trade Service* (Melbourne).

Aylesbury.—Loans Sanctioned.—The Town Council has received sanction to a loan of £2,200 for converting plant in connection with the supply of electricity to the works of Hazell, Watson & Viney, Ltd., and also to £6,000 for the purchase of domestic apparatus to be let on hire.

Blackburn.—Year's Working.—We have received from Mr. P. P. Wheelwright, borough electrical engineer, a copy of his report, together with the statement of accounts, for the year ended March 31st last. The total income amounted to £162,283, and working expenses were £72,247, leaving a gross profit of £90,036, to which was added a grant from the Unemployment Grants Committee of £254, and the proceeds from the sale of old machinery of £1,370, making a total of £91,660. The previous year's figures were: Income, £152,166; working expenses, £69,223; gross profit, £82,943. The power of capitalisation of interest and suspension of sinking fund expired during the year, and consequently the full interest and sinking fund charges had to be borne. These amounted to £61,546 and £51,085 respectively, which, together with other charges, totalled £119,757, thus leaving a net deficit of £28,096. The capital expenditure during the year amounted to £124,592, the chief item being £75,698 for mains and distributing plant. The electrical energy sold increased from 17,237,626 to 21,843,041 kWh, and the maximum supply demanded from 10,170 to 12,496 kW. The average price per kWh obtained fell from 2.07d. to 1.74d. Work was commenced during the year on the laying of a transmission line between the Corporation electricity works and the Preston station.

Bradford.—Street Lighting.—The street-lighting tests now being carried out for purposes of comparison between electricity and gas involve, so far as the Electricity Department is concerned, 300-watt gasfilled lamps suspended from tramway standards designed for use on main roads, lamps of 500-watt capacity for the city centre, and lamps of 200 watts for the suburban streets.

Brighton.—Loans.—The Town Council has received sanction to a loan of £3,890 for the provision of a new switchboard at the North Road sub-station, and is applying for a further loan of £4,050 for mains and services in the Portslade area.

Mains Extensions.—The Electricity Committee is to carry out extensions to mains at an estimated cost of £4,200.

Builth Wells.—Inauguration of Supply.—The power station owned by the Builth Wells Electric Supply Co., Ltd., was formally inaugurated on September 19th. The plant consists of a 40-kW d.c. generator supplied by the Electric Construction Co., Ltd., driven by a 70-h.p. semi-Diesel engine by Messrs. Ruston & Hornsby, Ltd., and a 125-cell, 600-amp. battery supplied by Messrs. Pritchett & Gold & E.P.S. Co., Ltd. The switchboard was supplied by the Austin Lighting Co., Ltd., the overhead cables by Messrs. W. T. Henley's Telegraph Works Co., Ltd., and the insulators, &c., by Messrs. Bullers, Ltd. The resident engineer is Mr. J. B. Colbran.

Caterham.—Price Reductions.—The Urban Electric Supply Co., Ltd., announces that from October 1st the price of electricity for lighting will be reduced from 1s. per kWh to 10d. per kWh, subject to minimum charges of 12s. 6d. for the winter quarters and 8s. 4d. for the summer quarters.

Cheadle and Gatley.—Loans.—The Urban District Council has applied for sanction to loans of £6,286, £500, and £3,670, for extending its electricity supply to Adswood, High Grove Road, Gatley, and Styal Road. The electrical engineer has been asked to report on the advisability of applying for a Special Order to supply certain parts of Northern Etchells.

Continental.—Spain.—The Sociedad Canalizacion y Fuerzas del Guadalquivir, which was formed in Madrid last year, has secured a concession to utilise the water power of the River Guadalquivir at eleven different points between Cordoba and Seville and is to construct a hydro-electric power station with an annual output of 34 million kWh. The distribution of the power will be undertaken by the Compania Sevillana de Electricidad and the Sociedad Hidro-electrica de Chorra.

Switzerland.—The Société des Usines Electriques d'Olten-Aarburg recently decided to modernise its hydro-electric power station at Ruppoldingen on the Aar which has been in operation since 1896 and to change over the system of supply from two-phase, 40 cycles, to three-phase, 50 cycles. The old plant comprised ten Jonval-type axial turbines, developing 300 h.p., at 28.5 r.p.m. The contract for the work was given to the Société Motor Columbus, of Baden, for the electrical equipment and with the Société des Ateliers des Charmilles, of

Geneva, for the turbines. The Charmilles Co. has supplied nine vertical spindle turbines which develop 1,000 h.p. each at 94 r.p.m.

Italy.—Plans have been passed by the authorities for the erection of two new power stations capable of generating about 250 million kWh per annum. The cost of the construction, which is estimated at 100 million lire, will be defrayed by the Societá Elettrica Tridentina and associated enterprises.—*Reuter's Trade Service* (Milan).

A syndicate supported by the authorities of the four Italian provinces of Alexandria, Cuneo, Novara, and Imperia has drawn up plans for the utilisation of the water power of the River Tanaro. The scheme provides for the construction of five artificial lakes above the town of Ceva, and for five hydro-electric power stations, three of which would supply electricity in the Piedmont district and two in the Ligurian.

Falkirk.—Year's Working.—The report on the working of the Burgh electricity undertaking (engineer, Mr. T. M. Climie) for the year ended May 15th last, shows a total income of £32,093, as compared with £27,150 in the preceding year. Working expenses were £22,877, as against £20,559, leaving a gross profit of £9,216 (£6,591), to which was added a sum of £357, transferred from the reserve fund, making a total of £9,573. This was distributed as follows: Interest, £3,491; sinking fund, £5,089; property and income tax, £827; bad debts, £22; capital expenditure account, £144. The amount spent on capital account during the year, which included £15,782 for machinery, was £21,323. The sales of electrical energy increased from 3,303,340 to 4,356,469 kWh, and the maximum supply demanded from 2,200 to 2,380 kW.

Glasgow.—Progress during August.—The Corporation electrical engineer reports that 81 houses were wired during August, making the total to date under the scheme 1,180, and that the number of applications for the hire of appliances was 149, making the total 7,433.

Electricity Meters.—The Electricity Committee has recommended the introduction of pre-payment "penny-in-the-slot" meters into houses of tenants who have been displaced from slum properties under clearance schemes of the Corporation, the engineer to make the necessary arrangements with the Housing Committee.

Gravesend.—Loan.—The Corporation is applying for sanction to a loan of £39,858 in connection with the second 5,000-kW extension.

Irish Free State.—Newcastlewest (Co. Limerick).—The Town Commissioners propose to extend the electric lighting of the town, and have requested the local electric lighting company to prepare an estimate of the cost of the electric cables required for the purpose. The Commissioners are prepared to obtain a loan for the carrying out of the necessary extensions.

Kettering.—Year's Working.—The accounts of the Urban District Council's electricity undertaking (engineer: Mr. W. A. Walker) for the year ended March 31st last show a total income of £42,361, as compared with £37,592 in 1923-24. The working expenditure was £24,866, as against £19,807, leaving a gross profit of £17,496 (£17,785). After deducting capital charges there was a net surplus of £2,640. This was added to a balance of £9,722 brought forward from the preceding year, and £4,501 was appropriated for capital purposes, £1,080 contributed to the district rate, and the remainder carried forward. The sales of electrical energy increased from 3,932,134 to 4,502,400 kWh.

Leeds.—New Plant.—A new 26,000-kW stator, weighing 50 tons, was delivered at Leeds on September 24th and conveyed to the electricity station by a special wagon belonging to Messrs. H. Bentley & Co., Ltd., of Bradford. It was made by C. A. Parsons & Co., Ltd.

Llandovery.—Electricity Scheme.—The Urban District Council has given Messrs. Reynolds, of Swansea, permission to erect a power station in the town and to erect overhead cables to carry current at 220 V. A crude oil engine will be installed at the power station.

London.—St. Pancras.—The Borough Council has received sanction to a loan of £2,464 for additional coal handling plant at King's Road generating station.

Hammersmith.—The Electricity Committee has recommended to the Borough Council that extensions to the condensing water plant at the electricity works be carried out at an estimated cost of £18,695, and that the scheme be submitted to the Electricity Commissioners for approval.

Manchester.—Progress during July and August.—During the months of July and August the Corporation electricity undertaking showed an increase in connections of 3,208 kW, bringing the total to 268,349 kW; and the number of applications received for supply, including existing consumers for additional supplies, was 1,474, representing a total of 4,037 kW. The number of consumers connected increased by 533, and the number of hired cookers connected by 151, bringing the total actually on circuit to 932. Applications for the hire of cookers totalled 135.

Mansfield.—Electricity Supply.—The Corporation Electricity Committee has recommended that a supply of electricity be given to Rainworth. It is also recommended that the Corporation bear the initial cost of wiring and installing services, the consumer paying an increased charge per kWh to cover the cost of installation.

Northern Ireland.—Kilkeel (Co. Down).—The Rural District Council has given notice of its intention to apply to the Electricity Commissioners for Northern Ireland for a Special Order, authorising it to supply electricity in Rostrevor. It is proposed to lay mains in the district within two years from the receipt of the Order.

Oldham.—Loan Sanctioned.—The Town Council has received sanction to loans of £50,000 for mains and £15,000 for transformers.

Romsey.—Electricity Supply.—At a recent meeting of the Town Council it was reported that the Committee had been unable to make satisfactory terms with Christy Bros. and Co., Ltd., for a supply of electricity to the borough, and was in communication with Southampton Corporation and other bodies with a view to obtaining a supply.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising Southampton Corporation to supply electricity in certain parishes in the rural district of South Stoneham.

Application has been made by the Midhurst Brick Co., for an Order to supply electricity in certain parts of the rural districts of Midhurst and Westhampnett, and Major C. H. B. Prescott-Westcar has applied to the Commissioners to amend the Wiltshire Avon Electricity Order so as to include the district of Morgan's Vale and Woodfalls.

Tanfield (Durham).—Inauguration of Supply.—The Urban District Council's electricity scheme was inaugurated on September 23rd. The contractors for the overhead line, which is 14 miles long, were Messrs. Gray Brothers (Newcastle), Ltd., and the underground cable for 6,000 V, 1½ miles in length, was laid by Messrs. W. T. Henley's Telegraph Works Co., Ltd. Two transformer stations have been erected, one at Burnopfield and one at Tanfield Lea, at which points the energy is reduced from 6,000 V to 440 and 250 V.

Thornton-le-Fylde.—Electricity in Bulk.—At a meeting of the Urban District Council on September 17th, it was stated that the final terms had now been arranged with the Blackpool Corporation for the supply of electricity in bulk, and an effort was being made to secure an early supply for consumers.

West Ham.—New Electricity Charges.—The Borough Council has approved the following new electricity charges, submitted by the electrical engineer:—Multi-part tariff: A fixed charge per lamp varying from 8s. per annum, or 8d. per month for the equivalent of three 60-watt lamps installed to 4s. 4d. per annum, or 4½d. per month for the equivalent of 16 60-watt lamps installed, with an additional charge of 1d. per kWh for energy consumed for lighting, heating, and cooking. These charges include meter rent, and will be subject to a discount of 5 per cent. for prompt payment. No account will be taken of any points installed for heating or cooking purposes. Domestic house installations: A charge of 5s. or 6s. per point per annum, according to the period allowed for repayment of a loan of £5,000 which has been applied for to cover requirements under the scheme for two years. The charge covers the complete installation with plain shades, service cable, &c., and includes maintenance.

Weymouth and Melcombe Regis.—Year's Working.—The accounts of the Corporation electricity undertaking (engineer: Mr. G. Nicholson) for the year ended March 31st last record a total revenue of £26,551, as compared with £25,494 in 1923-24. Working expenses increased from £16,563 to £18,410, leaving a gross profit of £8,142, as against £8,931. After deducting capital charges, &c., there was a net surplus of £1,034, as compared with £2,392 in the preceding year. The capital expenditure during the year amounted to £18,678, the chief items being £9,373 for machinery and £8,371 for mains and services. The sales of electrical energy increased from 1,431,808 to 1,585,039 kWh, and the maximum supply demanded from 713 to 873 kW.

Wirral.—Electricity Scheme.—The decision of the Rural District Council not to accept the offer of electricity from Birkenhead but to proceed with its own scheme, will shortly give employment to 600 men in laying cables from Wallasey through the centre of Wirral to Ellesmere Port. It is hoped that some districts will have a supply before Christmas. In all, nine sub-stations will deal with the supply. It is estimated that before the end of two years 2,000 houses, as well as factories and institutions, will be receiving a supply. The policy is to avoid overhead distribution wherever possible.

Tramway and Railway Notes.

Australia.—N.S.W. Railway Electrification.—According to the *Industrial Australian and Mining Standard*, the preliminary work in connection with the electrification of the Sydney suburban railway system is nearing completion, and on August 2nd the final section of the quadruplication of the Illawarra line, between Rockdale and Hurstville, was opened for traffic. The Illawarra suburbs are now served with four tracks for a distance of nine miles, and further improvements will be effected in the train services, prior to electrification.

It is proposed that the new electric trains shall consist of units of two, four, six and eight cars, made up of motor and trailer cars alternately. The N.S.W. railway authorities state that the electrification of this railway line is making good headway. Already satisfactory progress has been made with the erection of overhead wires, signal boxes, and bridges. It is expected that electric trains will be in operation between Sydney and Sutherland by about June of next year.

Bournemouth.—New Cars.—The Corporation is to purchase 20 new tramcars.

Bradford.—Motor-Omnibuses.—The Tramways Committee has appointed a sub-committee to consider proposals for running motor-'bus services in districts between tramway routes as feeders for the tramways.

Brazil.—New Railway.—*Commerce Reports* states that a concession has been granted by the State Government of Minas Geraes to Messrs. Armando Carneiro and Phillip A. Burton, for the construction and operation of a steam or electric railway between Uberaba and Porto Feliz, a distance of approximately 400 km. The line is to be of 1-metre gauge.

Cardiff.—Year's Working.—The report on the working of the Corporation tramway undertaking (manager, Mr. R. L. Horsfield) for the year ended March 31st last, shows a total revenue of £284,155, as compared with £280,867 in the previous year. Working expenses amounted to £211,399, as against £201,993, leaving a gross profit of £72,756 (£78,874). After deducting capital charges, &c., a net surplus of £43,479 remained, of which £22,248 was contributed to the borough fund. The previous year's working resulted in a surplus of £39,314. The number of passengers carried increased from 41,123,280 to 42,985,404, a record for the undertaking, and the car-miles run from 3,012,626 to 3,220,186. The average traffic revenue per car-mile fell from 22.02d. to 20.74d.

Continental.—Austria.—According to *Commerce Reports*, preliminary plans for the electrification of the Austrian lines from Salsburg to Woergl and from Kufstein to Brenner are well under way. The Austrian Siemens-Schuckert-Werke has received an order for the construction and equipment of the sub-station at Feldkirch, and the construction of transmission lines from Ruetzwerk has been awarded to the A. E. G. Union and the Oesterreichische Bergmann-Elektrizitätsgesellschaft. The last concern is also constructing the cable from Bludenz to Feldkirch. Seven fast mountain passenger locomotives have already been shipped and are in operation between Innsbruck and Bludenz. In addition, 20 passenger locomotives have been ordered, of which 19 are already furnished. Twenty freight locomotives have been supplied and are in operation, and four fast freight locomotives for use in the valley are under construction. The total expenditure on this scheme during the second quarter of 1925 amounted to 8,525,000 schillings.

Italy.—According to *Modern Transport*, the first Italian underground railway was inaugurated at Naples on September 20th. The cost of the line was 115 million lire, and the length is 13 km.

Ilford.—Year's Working.—The report of the manager of the Urban District Council's tramway undertaking (Mr. L. E. Harvey) for the year ended March 31st last shows a total revenue of £68,036, as compared with £66,618 in the preceding year. Operating expenses amounted to £57,676, as against £57,199, leaving a gross profit of £10,360 (£12,434), to which was added rent from leased line (East Ham) and other items, making a total of £14,286. After deducting capital charges, there was a net surplus of £1,044, as compared with £2,480 in 1923-24. The number of passengers carried increased from 11,953,336 to 13,618,970, and the car-miles run from 926,183 to 958,058. The revenue per car-mile fell from 17.26d. to 17.04d.

India.—Bombay Railway Electrification.—According to *The Times Trade and Engineering Supplement*, contracts have been signed by the Bombay, Baroda, and Central India Railway with British firms for the supply of rolling stock and for the construction of equipment in connection with the electrification of its suburban system. It is expected that the electrification of the 31 miles northward from Bombay terminus, covering the suburban traffic on this route will be completed by 1927. Work on quadrupling the lines as a preliminary to electrification is proceeding. The contract for the overhead equipment has been placed with Callender's Cable and Construction Co., and Messrs. Cammell Laird have been awarded the order for the rolling-stock consisting of 160 all-steel coaches of special design to suit Bombay suburban requirements.

The Western Ghat section of the Great Indian Peninsula Railway is expected to be completed by 1929.

Preston.—Year's Working.—The accounts of the Corporation tramway (general manager, Mr. H. Clayton) for the year ended March 31st last, record a total revenue of £84,917, as compared with £85,625 in the 1923-24. Working costs totalled £70,028, as against £66,212, leaving a gross surplus of £14,889 (£19,414). After deducting capital charges, &c., there was a net deficit of £1,693, as compared with a surplus of £3,549 in the preceding year. The number of car-miles run fell from 1,229,429 to 1,214,817, and the total revenue per car-mile rose from 16.715d. to 16.776d. The number of passengers carried increased from 14,549,749 to 15,052,428.

Tramway Improvements.—The Corporation Tramways Committee has considered the laying of double tramway lines in lieu of the existing single lines at various points and has recommended that application be made to the Ministry of Transport for consent to the scheme.

Salford.—Year's Working.—We have received from Mr. J. S. D. Moffet, general manager of the Corporation tramway undertaking, a copy of his report, together with the statement of accounts for the year ended March 31st last. The total income amounted to £520,978, as compared with £534,804 in 1923-24, and working expenses were £412,312, as against £399,222, leaving a gross profit of £108,666 (£135,681), to which was added the sum of £10,290 for interest on investments, &c., making a total of £118,956. This has been dealt with as follows: Payment to local authorities for running powers, &c., £27,355; interest and sinking fund charges, £71,576; repairs, &c., to property in Church Street, £271; special reserve, outside authorities, £7,750; relief of rates, £10,000; depreciation and renewals fund, £2,005. The last two items represent the net surplus for the year. The previous year's working resulted in a surplus of £42,202. All the above amounts embody the figures for the motor-omnibus services. The number of passengers carried increased from 80,365,747 to 81,652,275, and the car-miles run fell from 6,307,301 to 6,238,336. The average total revenue per car-mile rose from 18.784d. to 18.829d.

Telegraph and Telephone Notes.

Australia.—Telegraph and Telephone Estimates.—The estimated expenditure on Federal public works for the financial year 1925-26 shows an increase of £1,608,988 for the Postmaster-General's Department. For the construction and extension of telegraphs and telephones, conduits, underground wires, land, and buildings, £6,000,000 has been allotted to the Postmaster-General's Department.—*Reuter's Trade Service* (Melbourne).

Brazil.—New Radio Station.—A wireless telegraph station, employing the Telefunken system, has been opened at Salinas, 70 miles east of Para, under the supervision of the Brazilian Telegraph Department. The charge for the transmission of messages to foreign vessels is 10 fr. for any number of words up to ten, and 1 fr. for each additional word.

China.—Wireless Controversy.—An official of the Foreign Office has stated that a French company recently opened a wireless station at Mukden, but ceased operations following a Japanese official protest. In spite of this protest, Marshal Chang Tso-lin has granted the French company authority to continue operation. The Japanese Ambassador in Washington will soon be instructed to begin conversations with the United States Secretary of State with regard to the Chinese wireless situation in the hope of reaching a compromise. The Japanese and American Governments do not favour the Chinese proposal to float a loan for taking over all wireless interests in China; international joint management is suggested as a possible solution.—*Reuter* (Tokio).

France.—Strike.—M. Chaumet, Minister of Posts and Telegraphs, has taken severe steps to punish the leaders in last week's two hours' telephone and telegraph strike. Five employés who went round the offices and pulled down switches, throwing the telephone apparatus out of action, have been dismissed. Ten others who were active in advising their colleagues to stop work have been placed on the resting list, and about 20 other men and women employés who took a prominent part in organising the strike have been changed from one office to another in the provinces, or severely reprimanded.—*Daily Mail.*

Smyrna.—Telephone Concession.—A contract was recently signed by the Minister of the Interior, acting on the part of the Turkish Government, by which a concession for the installation and operation of a telephone system was granted to the municipality of Smyrna for a period of 35 years. The municipality has agreed to obtain sufficient capital to cover all expenses, and the system will provide service for 2,000 subscribers. The concessionaire is obliged to complete the installation in the city of Smyrna within one year and three months of the procurement of the capital, and in the suburbs within two years. However, the terms of the contract authorise the municipality, upon the approval of the Minister of the Interior, to transfer the concession to a private company, provided the terms of the contract shall be observed by the transferee. The operation of the system is to be under the control of the Government, which has also retained the right to purchase the entire system and equipment within 15 years.—*Commerce Reports.*

The Telephone Service.—New Exchange.—A new telephone exchange has been opened at Cholsey, in Berkshire.

Theft of Cable.—Thirty-four London City telephones were out of order recently as the result of a theft of cable from street manholes by a gang of men.

Leeds Automatic Service.—The extension of the automatic telephone system to the suburbs of Leeds, as well as the big automatic central exchange, has been a long process, but is now practically completed, the new exchange buildings at Roundhay, Chapeltown, Headingley, and Stanningley being finished and the plant installed. Tests will occupy most of October, and the change-over is expected to be made early in November.

Radio Notes.

Birmingham.—New Plant.—It has been pointed out to us that it was hardly correct to describe the new transmitting plant at the Birmingham station, which was referred to in our September 18th issue, as having been built on similar lines to the plant at the Daventry high-power station. The apparatus in use at Birmingham is of a different manufacture from that at Daventry, and the actual circuit used is quite different, the water-cooled valve at Birmingham being a high-frequency magnifier, whereas the Daventry circuit is a modified choke-control circuit. The actual power in the aerial at Birmingham is 1 kilowatt, and at Daventry it is approximately 15 kilowatts. The new Birmingham transmitter is extremely compact and very easy to work, and from the reports that the B.B. Co. has received, it is a considerable advance on the set which it has replaced.

Ship's Wireless.—Wavelength Agreement.—By agreement between the British, Canadian, and United States Governments, merchant ships after October will cease operating their wireless apparatus on a wavelength of 300 to 450 metres when within 250 miles of the coasts of the three countries. The object is to prevent wireless broadcast programmes from being interfered with by Morse.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Ashford (Kent).—Urban District Council. Electricity meters. (See this issue.)

Australia.—Melbourne.—Postmaster-General's Department. Motor-generator sets for charging secondary batteries. (See this issue.)

Belgium.—October 7th. Belgian Ministry of National Defence, 10, Rue du Meridien, Brussels. Wireless telegraphy and telephony transmission and reception sets. Particulars for 4 fr. from the Cahier des Charges Special No. 583.

October 19th. Municipal authorities of Antwerp. Electric travelling crane at one of the dry docks. Particulars for 5 fr. from Hotel de Ville, Antwerp.

October 14th. Municipal authorities of St. Gilles, Brussels. Supply of a 2,500-kW turbo-generating set.

October 23rd. Belgian Post and Telegraph authorities at La Salle Madeleine, Brussels. Supply and laying of telegraph and telephone cables between Brussels and La Panne, Brussels and the German frontier at Hergenrath, Brussels and Lille, and between Brussels and Roosendael. Particulars for 9.50 fr. on application to Cahier des Charges Special No. 3-144.

October 7th. Supply and laying armoured telephone cables between Buggenhout and Baesrode. Particulars (Cahier des Charges Special No. 3-131) for 2.60 fr.

Birmingham.—October 8th. Board of Guardians. Electrical installation in the new extension of the nurses' home at Selly Oak Hospital. (See this issue.)

Edinburgh.—October 16th. Corporation. 12 electric tramcar trucks, electrical equipment of cars, and air-brake equipment. Specifications from the manager.

The Gas Department invites offers for the supply of steam-, motor- or gas-driven boosting plant at the Granton works. Particulars from Engineer, 15, Calton Hill, Edinburgh.

Edmonton.—October 13th. Board of Guardians. Electric lighting and power installation at Enfield House. (September 25th.)

Erith.—October 9th. Urban District Council. Cable, e.h.p., h.p., and l.p., dividing boxes, cable racks, &c. (See this issue.)

India.—India Store Department. October 14th. L.p. turbine-driven d.c. generating set, condensing plant, and accessories. (September 18th.)

Leeds.—October 20th. Tramways Department. 150 double-deck top covered tramcars complete, or, alternatively, 150 tramcar bodies, 190 tramcar trucks, including wheels and axles, 190 tramcar electrical equipments. (See this issue.)

Lichfield. — October 19th. Electricity Department. Transformers, switchgear, and cable connections; e.h.p. and l.p. cables, boxes, and roadwork; e.h.p. overhead transmission line. (September 25th.)

London.—London County Council.—Highways Committee. October 12th. H.p. and l.p. switchgear for Shoreditch L.C.C. tramway sub-station. (September 18th.)

Islington.—November 11th. Electricity Department. 3-phase, 6,000/6,600-V and two-phase or single-phase 2,500/2,000-V switchgear and accessories. (September 25th.)

H.M. Office of Works.—October 14th. Dismantling wiring and rewiring in conduit at Charity Commissioners' office, Ryder Street, W. (September 25th.)

Manchester. — October 7th. Electricity Department. One 10-ton hand-operated overhead travelling crane and gantry. Specifications from Mr. H. C. Lamb, manager, Electricity Department.

October 5th. Board of Guardians. Electric lamps required during year commencing October 1st, 1925. Forms of tender from Mr. J. Macdonald, clerk to Guardians, Union Offices, All Saints.

Newport (Mon.).—October 28th. Electricity Department. Electrically-driven pumps, pipework, valves, &c.; switchgear; water-screening plant. (See this issue.)

New Zealand.—Wellington.—Post and Telegraph Department. October 27th. Rubber-insulated wire.*

Public Works Department. November 24th. Neutral earthing reactors.*

December 8th. Steel transmission line supports for the Waikato power scheme.*

Rawdon.—October 5th. Board of Governors. Electric light installation at Mitchell Memorial Home. Specification, &c., from Mr. W. H. Brown, County Hall, Wakefield.

South Africa.—Johannesburg.—S.A. Railways. October 29th. Electric cables and wires.*

Cape Town.—October 14th. Electricity Department. Electric motors.*

Southend-on-Sea.—Light Railways and Electricity Department. House-service meters and demand indicators. (See this issue.)

Stoke-on-Trent.—October 12th. Electricity Supply Department. Two sets of steam air ejectors, and one centrifugal oil purifier. (September 25th.)

Switzerland.—Berne.—October 17th. Swiss Federal Railways. Supply and installation of three single-phase, 3,000-kVA transformers, switchgear, &c.; a similar equipment for the Freiburg transformer station; two 3,000-kVA transformers for the Kerzers transformer station; and three 3,000-kVA transformers and switchgear for the Burgdorf transformer station. Particulars from the Electrification Section of the S.B.B., Zimmer 166, 43, Mittelstrasse, Berne.

Uruguay. — Montevideo.—December 22nd. State Electricity Supply Works. December 28th. 200,000 metres r.i. wires and cables. 1,060,000 metres of special cable for outside use.*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Adwick-le-Street.—Urban Council. Accepted:—
Wiring 380 houses for electric light (£2,772).—Building & Colliery Supply Co., Ltd. The highest tender was £6,174.

Barnsley.—Town Council. Accepted:—
Ash elevator and bunker for the electricity works (£880).—W. J. Jenkins and Co., Ltd.

Brighton.—Lighting Committee. Accepted:—
Two switchboard panels (£159).—Metropolitan-Vickers Electrical Co., Ltd.

Works Committee. Accepted:—
Installation of electric lighting at Corporation depôt in Hollingdean Road:—

Bostel Bros., Ltd. (Accepted.)	**£184**
Page & Miles, Ltd.	222
R. Garrett	236
J. Taylor	250
C. B. Pennifold	257

Devizes.—Town Council. Accepted:—
Installing electric light in the Town Hall (£103).—James Bros. Twelve tenders were received, the highest being £197.

Dunfermline.—Dunfermline Combination Home and Hospital Committee.
Electric lighting installation (£1,200).—Jas. Scott & Co.

Epsom.—Urban Council. Accepted:—
Overhauling and repairing the Diesel engine at the electricity works (£677).—Carels Diesel & Steam Engines (London), Ltd.

Glasgow.—Tramways Committee. Accepted:—
Graphite brushes.—Kay & Co. and Messrs. Birkbys.
Commutators.—P. R. Jackson & Co., Ltd.
Time recorder.—International Time Recording Co., Ltd.
Alterations to goods hoist.—Waygood-Otis, Ltd.

Greece.—Athens.—The Technical Commission appointed to examine the tenders for the supply of electric light and power to Athens and the Piræus has rejected the offers of the existing Greek Electric Light Company and accepted, with certain reservations, those of the group consisting of the Power and Traction Finance Co., of London, in conjunction with the Greek National Bank and other banks. The proposals of this group involve a loan of £2,000,000 under the Trade Facilities scheme.—*Reuter.*

Hornsey.—Electricity Committee. Recommended:—
Switchgear for 300-kW motor-converter at Muswell Hill sub-station.—Park Royal Engineering Co., Ltd.
Erection of crane and rails at Muswell Hill.—Herbert Morris, Ltd.

Ilford.—Electricity Committee. Recommended:—
Crane, gantry, and runway at Goodmayes sub-station (£218); crane at Gant's Hill sub-station (£105).—H. Morris, Ltd.
Kiosk and transformer at New North Road sub-station (£156 for kiosk and £118 for transformer).—Foster Engineering Co., Ltd.
1½ miles single cable, ½ mile 2-core cable, ½ mile 3-core cable.—Macintosh Cable Co., Ltd.
4 miles single cable.—Hackbridge Cable Co., Ltd.
6 miles single cable, 6 miles 3-core cable, 2 miles 4-core cable.—Deutsche Kabelwerke A.G.

Tramways Committee. Accepted:—
Trolley wire (10 1/16d. per lb.).—Frederick Smith & Co., Ltd.

Ipswich.—Electricity Supply and Tramways Committee. Accepted:—
15 single-decked trolley vehicles (£20,890).—Ransomes, Sims & Jefferies, Ltd.
15 do. do. (£20,940).—R. Garrett & Sons, Ltd

London.—Poplar.—Electricity Committee. Recommended:
4-panel switchboard (£309), and 200-kVA transformer (£215).—Johnson and Phillips, Ltd.

St. Marylebone.—Highways Committee. Recommended:—
Refuse destructor plant. One 200-kW steam generator set (£1,995).—Browett, Lindley & Co., Ltd.

Electricity Supply Committee. Recommended:—
D.c. and a.c. ordinary and prepayment meters for 12 months.—Chamberlain & Hookham, Ltd.; Ferranti, Ltd.

Manchester.—Electricity Committee. Accepted:—
6,600-V sub-station switchgear, Burnage, Bowker Vale, and Guide Bridge sub-stations.—Metropolitan-Vickers Electrical Co., Ltd.
Steam-heating plant, Oldham Road "B" and High Street sub-stations.—H. Tattersall, Ltd.
Constructional steelwork, Burnage sub-station.—Lambourne & Co., Ltd.
150 weldless steel lamp columns and fittings and 12,000 yd. 3 in. weldless-steel tubes.—British Mannesman Tube Co., Ltd.
15-ton and 2½-ton cranes.—H. Morris, Ltd.
1½-ton runway.—Vaughan Crane Co., Ltd.
6,600-V switchgear, Dickinson Street sub-station.—Ferguson, Pailin, Ltd.
12 months' supply of electric cooking ranges.—Jackson Electric Stove Co., Ltd.; Cable Accessories Co., Ltd.; Metropolitan-Vickers Electrical Co., Ltd.
12 months' supply of ironclad switches and cut-outs.—Edison Swan Electric Co., Ltd.; J. H. Tucker & Co., Ltd.; General Electric Co., Ltd.; Baxendale & Co., Ltd.
Spare armature with motor rotor.—Metropolitan-Vickers Electrical Co., Ltd.

Annual Stores Contracts. Accepted:—
Insulating cloth.—L. Andrew & Co.
Insulators.—J. Macintyre & Co., Ltd.; Taylor, Tunnicliffe & Co., Ltd.; Gaskell & Grocott; Doulton & Co., Ltd.; Bullers, Ltd.
Tapes.—Callender's Cable & Construction Co., Ltd.; Siemens Bros. and Co., Ltd.; J. Bonas & Son; Johnson & Phillips, Ltd.; L. Andrew and Co.
Cotton and silk covered wire.—Pirelli-General Cable Works, Ltd.
Tinned copper and tin fuse wire.—Concordia Electric Wire Co., Ltd.; L. Andrew & Co., Ltd.
Tinned steel binding wire.—Brunton, Ltd.

Central Purchasing Committee. Accepted:—
Lamps.—Drake & Gorham (Wholesale), Ltd.; W. E. Beardsall & Co., Ltd.; R. O. Brien & Co.; F. G. Ride & Co.; Hirst, Ibbetson and Taylor, Ltd.; Sloan Electric Co., Ltd.; Underwood (Manchester), Ltd.; Stella Lamp Co., Ltd.; B. I. & H. Cables, Ltd.

South Africa.—Ladybrand, O.F.S.—Town Council. Accepted:—
Electric lighting scheme (£16,250).—Siemens (South Africa), Ltd. The estimate includes power station buildings and 100 house connections with meters complete.

Southend-on-Sea.—Corporation. Accepted:—
Wiring 89 houses, for the Corporation housing scheme (approx. £500).—F. M. Burley & Co.

St. Albans.—Board of Guardians. Accepted:—
Installation of electric drive at the laundry (£102).—Messrs. Giffen.

Forthcoming Events.

Institution of Electrical Engineers (Western Centre).—Monday, October 5th. At the Swansea Chamber of Commerce. At 6 p.m. Inaugural address by the chairman, Mr. J. W. Burr.

(South Midland Students' Section).—Tuesday, October 6th. At the Queen's Hotel, Birmingham. At 7.30 p.m. Address by the Chairman, Mr. R. H. Rawll.

Junior Institution of Engineers (North-Western Section).—Monday, October 5th. At the Geographical Society's Room, 16, St. Mary's Parsonage, Manchester. Annual general meeting and address by the chairman, Mr. J. D. Porteous.

Institute of Transport.—Monday, October 5th. At the Institution of Electrical Engineers, Victoria Embankment, W.C.1. Presidential address by Col. Sir Joseph Nall, D.S.O., M.P.

National Association of Supervising Electricians.—Tuesday, October 6th. At the Junior Institution of Engineers, 39, Victoria Street, S.W. At 7.15 p.m. Presidential address by Mr. F. Gill.

International Motor Exhibition.—October 8th-17th. At Olympia, W.

Electrical Trades Commercial Travellers' Association.—Saturday, October 10th. At the Manchester Hotel, Aldersgate Street, E.C. At 7.30 p.m. Bohemian concert.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the names of makers or suppliers of:—

Martin's fuses.
Barkay reflectors (photographic).
Zehnder magnetic chucks.

Notes.

Water Dispute at Chester.—A peculiar situation has arisen at Chester affecting the Corporation's hydro-electric works, due to the alleged wastage of water by a local firm's leaving its sluice gates open. The Electricity Committee points out that this wastage prejudices the efficient working of the electricity works; consequently the Town Clerk wrote to the firm concerned asking it not to use its sluices in such a way as to prejudice the rights of the Corporation. The firm replied objecting to being dictated to in a peremptory manner as to the way in which it should exercise its rights, and, whilst making a temporary concession, said that it would not be repeated. The Corporation is taking opinion of counsel on the subject.

The Electrical Trades Benevolent Institution.—The Annual Festival. — The President for this year, Mr. Edgar S. Barralet, has issued a letter stating that the Festival Dinner of this Institution will be held at the Trocadero Restaurant, on Wednesday, November 4th.

"The main object of this Festival," he says, "is to supplement and emphasise the appeal that I now have the pleasure of making to you for contributions to the funds of this Institution for carrying out the good objects as set out above.

"The ever-widening development in the field of electrical industry, with the greater number of people engaged in it, makes it certain that increased calls will be made on the funds of the Institution, and its ability to meet them depends on the generous support of those engaged in the electrical industry, and trades dependent on it for their prosperity.

"Should you not be able to attend the Festival, I would ask you to send your contributions to the Fund to me or to F. B. O. Hawes, Esq., at the above address.

"It would be a great kindness if you could have a copy of this appeal posted on a notice board in your offices, in order to give it as wide a publicity as possible."

The address of the honorary secretary, Mr. F. B. O. Hawes, is 98, Grosvenor Road, S.W.1. We believe that to take a ticket for the festival, though unable to attend it, is much less advantageous than to send a contribution to Mr. Hawes.

American Generator Explosion.—A generator explosion in the plant of the Lake Shore Electric Railway Co. at Avon, Ohio, on August 23rd resulted in a fire which destroyed the plant, causing a loss of $250,000. A dozen or more villages extending along the shores of Lake Erie for about 40 miles depended on the plant for their lighting service and were thrown into darkness. Interurban cars were held up. Energetic steps to restore power were at once taken, and by the following night the Ohio Public Service Co.'s Edgewater station at Lorain was tied in and service to all the communities affected was resumed.—*Electrical World.*

The Cycle Show.—The annual Motor Cycle and Cycle Exhibition was held as usual at Olympia, but at an earlier date this year, namely, from September 21st to 26th, the opening ceremony being performed by Sir Burton Chadwick, Parliamentary Secretary to the Board of Trade.

Electrical interest was confined to the accessories section, excepting one electric tricycle that was shown by the Argson Engineering Co., Ltd. It is intended for the use of invalids and the aged; it will proceed at graduated speeds of from one to seven miles per hour, will climb a gradient of one in five, and has a radius of from 35 to 40 miles on a single charge. A D.P. "Kathanode" battery of 56 ampere-hours capacity at 24 volts is carried on the main tubular steel frame of the chair beneath the seat. A small electric motor is mounted on the back axle and drives the two rear wheels through reduction and differential gear, totally enclosed and running in an oil bath. Steering, speed, and brake control are combined in one tiller with a stirrup handle; by swinging the tiller to the right or left the chair is steered as desired, by a twist of the stirrup handle the rider can cause the chair to proceed either forward or backward at graduated speeds, or bring into operation a gradual or powerful electric brake, the respective speeds and brakes being indicated by a clearly visible pointer. A band brake actuated by a long lever is conveniently disposed on the near side of the chair, and the equipment includes electric lamps and an ampere-hour meter.

Messrs. Allen-Liversidge, Ltd., became, as from September 1st, the sole concessionnaires for marketing in Britain and export purposes the well-known E.C.L. cast-aluminium electric and acetylene lamps for commercial and other vehicles. The dual-purpose lamp is the most recent product of the company's motor-cycle lighting department, and possesses several features. It is designed so that by one or two slight adjustments it can be used either with electricity or acetylene as the lighting medium. The reflector with which it is fitted is detachable with slight pressure and a twist with the fingers, and its removal reveals a Mangin lens permanently fitted at the back of the lamp's interior, through which the bayonet fastening (electrically wired) for the bulb projects. When the electric lamp is removed, a special burner-carrier fitted with an ordinary open (Roni) burner can be set in the same bayonet joint which previously held the electric lamp. The whole operation of changing over from electricity to acetylene, or *vice-versa*, is a matter of a couple of minutes, and at the back of the lamp, readily accessible to the rider's hand while travelling, is a small metal plunger which controls the focus of the headlamp, so that the width of beam may be altered from the normal long narrow beam to a broad beam of diffused light which clearly illuminates both sides of the road, is claimed to be non-dazzle in character, and is of assistance in fog and when taking sharp corners.

In the garage equipment section special attention is drawn to the company's oxy-acetylene equipment for repairs to accumulators, &c.

Magnetos, lighting and ignition sets, impulse starters, "Fabroil" silent timing gears, &c., were exhibited by the British Thomson-Houston Co., Ltd. The magnetos are

rotating-armature light-weight machines, a feature being that the main housing is die-cast in one piece around the laminated poles. The combined lighting and ignition sets manufactured by this company are of two types; in one a magneto and generator are mounted as a combined unit, while in the "Sparklight" set the current for lighting is derived from the magneto. In the first-mentioned sets a voltage is generated in the windings of the drum-type armature of sufficient value to start charging the 6-volt accumulator when a speed of from 10 to 12 miles per hour is attained; by fitting an automatic cut-out under the brush gear, wiring is reduced. Lamps of pleasing design and durable finish are supplied with each set, whilst the battery is of sufficient capacity, without the aid of the generator, to supply 8 or 9 hours' light continuously.

Messrs. Rotherham & Sons, Ltd., exhibited amongst other things the "Barnet" universal sparking plug terminal, which is instantly detachable from either the plug or the h.p. wire lead. It eliminates all nuts, washers, and ferrules, and is fitted in a few minutes without tools, forming a variable spark gap by the rotation of a fibre ring. The terminal forms a simple means of testing the ignition on any number of cylinders at the same time when the engine is working and turned by hand, and it will fit any sparking plug except Lodge "all-weather" and similar special types.

Electro-plating plant was exhibited by Messrs. W. Canning and Co., Ltd., and Graner & Wells, Ltd., and the following firms were also represented: Batteries, Ltd. ("NI-FE"); Robinson Engineering Works, Ltd. (K.L.G. plugs); Astra Dynamo Co., Ltd. (lighting sets); Lodge Plugs, Ltd. (sparking plugs); A.C. Sphinx Sparking Plug Co., Ltd.; Powell and Hanmer, Ltd. (lighting sets and lamps); North & Sons, Ltd. ("Halford" magnetos and speedometers); Lucas Electrical Co., Ltd. (magnetos and lighting equipment); C. A. Vandervell & Co., Ltd. (lighting and ignition plant); Rotax (Motor Accessories), Ltd.; and the M.L. Magneto Syndicate, Ltd.

A Volta Centenary.—Arrangements are already in progress by the Italian Associazione Nazionale Industrie Elettriche to celebrate in a suitable manner the centenary of the death of Alessandro Volta, which took place near Como on March 5th, 1827.

Lectures.—The first of a series of University extension lectures on "Electricity in Every-day Life" was given at Plymouth Technical School on September 25th by Prof. F. H. Newman. In the course of his lecture Prof. Newman said that if the scheme for building a series of eight central power stations was proceeded with, it was probable that Plymouth would be the site of one of them. Speaking of the generation of electricity by water power, he referred to Dartmoor as a possible source of much power of this description, and mentioned that under a scheme now abandoned it had been proposed to build a power station there for taking the energy from a high-level reservoir at Totnes.

Women and Electricity.—A plea for electricity in the homes of the people was made by several speakers at the recent Birmingham conference of the National Council of Women of Great Britain. A resolution was brought forward urging on the Government the importance of developing a comprehensive electrical scheme for the whole country. Moving the resolution, Mrs. Bridgwater (Birmingham Branch) said that all new houses erected by public bodies should be wired for electricity. Miss Griff (chairman of the Women's Engineering Society) seconded, and the resolution was agreed to.

Birmingham Electric Club: 21st Anniversary.—On Friday, October 23rd, this Club will celebrate its 21st anniversary with a ladies' evening, ball, and whist drive at the Grand Hotel, Colmore Row, Birmingham. The Grosvenor Suite and Windsor Room have been engaged for the occasion. There will be a reception from 7 to 7.30 p.m.; whist from 7.45 to 9.45 p.m.; and dancing from 7.45 p.m. to 2 a.m.; with a supper interval from 10 o'clock to 11 o'clock. Tickets (10s. 6d. each, inclusive of supper) can be obtained before Saturday, October 17th, from the hon. sec., Mr. N. Deykin, 193, Station Road, Wylde Green, Birmingham.

Fatality.—An inquest was held at Manchester on September 24th on Alfred Dudley Drayson (22), an apprentice, who was killed on September 16th at the works of Messrs. Mather & Platt, Newton Heath, Manchester. Deceased, whose home was at Surbiton, Surrey, was a B.A. (Mechanical Science) of Cambridge. Mr. Arthur Merrill, chief electrical tester of the department in which Drayson worked, said that the deceased had been in his department 17 days and was very competent. Witness left him near the electrical switchboard, and on hearing a shout looked round and saw him on the floor. Witness rushed towards him and found that he was clear of all wires. Answering Mr. P. M. Oliver (who represented the family), witness said that Drayson might have slipped on the boards, which were darkened with oil, though in his opinion that did not happen. Had he slipped on the floor and clutched the switches, he would not have been able to release his grip. If his hand touched the "live" metal work he would have received a shock at 440 V. Acknowledging that the cause of death was a matter of conjecture, the Coroner said that it appeared that Drayson tried to keep his eyes on the switchboard meter while putting in the switches, and touched the "live" metal. "So far as I can gather," added the Coroner, "I do not think he slipped. The switchboard is the usual switchboard, and as far as I can judge, there was nothing wrong." A verdict of "Accidental death" was returned.

Appointments Vacant.—Distribution engineer (Rs. 1,000 per month) for supply undertaking in India. Plumber-jointer for the Hove Corporation Electricity Department. Showroom attendant (£250) for the Borough of Mansfield Electricity Department. Clerk, for the Colne Corporation Electricity Department. Assistant mains engineer for the City of Norwich Electricity Department. Scientific assistant for research in connection with electrical ignition appliances (£250 +), draughtsmen (£252 and £205), for the Royal Aircraft Establishment, Farnborough, Hants. Boiler-house assistant engineer and draughtsman, for the Hull Corporation Electricity Department. Junior mains assistant, for the Great Yarmouth Corporation Electricity Supply and Tramways Departments. Lady cook demonstrator, for the Beckenham U.D.C. Electricity Department. Two plumber-jointers, for the Mexborough U.D.C. Electricity Works. (See our advertisement pages to-day.)

New Spanish Electrochemical Works.—Large new works for the production of synthetic ammonia are approaching completion at La Felguera, in the province of Asturias, Spain, for the Sociedad Iberica del Nitrogeno, of Bilbao. The Claude process is being adopted, and the necessary electrical energy for the new works will be supplied from the 12,000-h.p. steam station at La Felguera of the Sociedad Co-operativa Electrica de Langreo and from the hydro-electric station of the Sociedad Hidro-Electrica del Cantabrico.

Automatic Train Control on Pennsylvania Railroad.—A contract has been entered into between the Pennsylvania Railroad and the Westinghouse Air Brake Co., on behalf of the Union Switch and Signal Co., for the installation of an automatic train control system on 700 locomotives and 1,000 miles of double track belonging to the railroad. The installation will cost between 6,000,000 and 7,000,000 dollars. The announcement of the contract was made by Mr. J. L. Humphrey, president of the Westinghouse Co.—*Reuter's Trade Service* (Pittsburgh).

Association of Special Libraries and Information Bureaux.—The idea of providing an opportunity for intercourse between those engaged in collecting and distributing information in the fields of science, industry, and public affairs, has met with gratifying success, under the auspices of this Association. Sir Arthur Steel-Maitland, Minister of Labour, opened a conference at Balliol College, Oxford, which lasted from September 25th to 28th, and was attended by over 200 delegates of organisations ranging from the scientific societies and large libraries, to research institutes and smaller associations of experts, in the aggregate probably representing more than half a million intellectual workers.

The attendance included M. Otlet, of the Institut International de Bibliographie, Brussels, and other visitors from Germany, Holland, and the United States, and the international aspect of the subject was further emphasised by a valuable address from Prof. Gilbert Murray, on the work of the Committee of Intellectual Co-operation of the League of Nations.

Dr. Chalmers Mitchell, F.R.S., spoke of the "World List of Scientific Periodicals," which has just been published with the help of the British Museum authorities; it discloses the existence of some 25,000 separate journals. The problems of translation and collective abstracting were dealt with in papers by several of the leading authorities in the engineering and chemical sciences. An attempt was made to give the conference some insight into the library methods of the daily and technical Press.

The information sections of such Government departments as the Board of Education, Ministry of Health, and Imperial Institute were described. Methods of filing and classifying library matter and correspondence were dealt with by Mr. R. Borlase Matthews, Mr. S. Jast (chief librarian of the Manchester Public Libraries), and others.

The Shannon Power Scheme.—At the annual meeting of the Electricity Supply Association of Ireland, referred to in our last issue, Mr. P. L. Spalding (Dundalk) mentioned the wages and hours dispute at Limerick on the launching of the Shannon scheme, and pointed out that the difference between 8d. per hour, estimated by the contractors, and 1s. 3d. per hour demanded by labour meant an enormous additional cost on the contract. Based on the estimate that 3,000 men would be employed, it meant £125,000 per annum, and, multiplied by the three years the work would be in hand, it would come to £375,000 for labour charges alone. In his opinion the estimate of receipts had been as much overstated as that of expenditure had been understated.

Mr. Wm. Ireland said Mr. Spalding's point was a serious one. It was only the beginning of the trouble, and he thought a protest should be sent to the Government against the scheme.

Mr. Wm. Hewat, president, said that, the scheme having passed Parliament, it was their duty and the duty of other bodies to render any assistance possible towards making it a success, whether they agreed with the methods taken or not. A question just as important as the other was the Bill that would regulate the distribution of electricity. He hoped the Government in promoting that measure would not ignore the interests of the country as they had done in the previous case.

At the Association's dinner Mr. Blythe, Minister of Finance, who was the chief guest, said he thought it had come to be realised that the development of electricity supply in Ireland was one of the matters that would determine to a very large

extent the degree of prosperity that they were to have in the future. The farmers would have to use their brains in a way in which they had not used them in the past, and they would find that electricity would be a powerful agent for their service. He felt certain that when legislation to control production and supply under the Shannon scheme came to be considered bodies like the Electricity Supply Association would be very useful in helping to work out that part of the scheme which had to do with the consumer.

Dr. T. McLoughlin, Free State representative of the contractors, states that there is no intention on the part of the firm of importing German labour; applications for employment have been received from all over the State, and an employment bureau will be opened in Dublin for registration, &c. The trouble in Limerick will not materially affect their plans, as the number of men employed in Limerick will be relatively small. It is now thought that the real work on the scheme will be undertaken in the first instance at Killaloe.

For the first time the Shannon scheme is mentioned in the Free State Revenue Returns, a temporary advance of £100,000 being announced under the terms of the Shannon Electricity Act of the last session of Parliament.

End of Summer Time.—Our readers are reminded that Greenwich mean time will be reverted to at 2 a.m. on Sunday next (October 4th).

Educational.—University of London, University College.—A course of six lectures on "Mercury Vapour Lamps" and "Mercury-Arc Rectifiers" will be delivered by Prof. J. A. Fleming, F.R.S., on Wednesdays at 5 p.m., beginning on October 28th, 1925. The course is open both to members and non-members of the University. Fee, £1 11s. 6d. Application for tickets of admission should be made to Dr. Walter W. Seton at University College, London.

Education in London.—A "Guide to Continued Education in London" has been received from the University of London Press, Ltd., price 6d. net; it gives particulars of the facilities for continued education provided by the London County Council, of which many residents are still unaware. The Council's scheme is of very wide scope, as is proved by the contents of this brochure; lists of institutions providing evening classes in commercial and technical subjects are given, with the days and hours of meeting, and references are included to pamphlets on specific subjects, which are supplied gratis on application. Information regarding scholarships and exhibitions is given in a special handbook published by Messrs. P. S. King & Son, price 3d. plus postage.

An Electrical Fire Claim.—It is reported that the California Wharf and Warehouse Co. and the Balfour-Guthrie Co. are claiming damages to the extent of $902,592 from the Great Western Power Co., of California, for alleged negligence which caused the destruction of their warehouses and properties by fire last year. The claimants state that the source of the fire was the transformer room in one of the warehouses. The power company denies responsibility for the loss.

Institution Notes.

Institution of Electrical Engineers (Western Centre).—The opening meeting of this Centre will take place on Monday next, October 5th, at the Chamber of Commerce, Swansea, when Mr. J. W. Burr, the chairman, will deliver his address. Other events for the session will be:—

November 2nd (Bristol).—"Domestic Electrification," by Mr. J. W. Beauchamp.

November 30th (Cardiff).—"Switchgear Developments during the Past Twenty Years," by Mr. J. H. Thomas.

January 11th, 1926 (Swansea).—Annual dinner and President's visit.

National Association of Supervising Electricians.—On Tuesday, October 6th, Mr. Frank Gill, M.Inst.C.E., M.I.E.E., will deliver his presidential address at the Junior Institution of Engineers, 39, Victoria Street, S.W. Mr. J. S. Highfield will take the chair at 7.15 p.m.

Diesel Engine Users' Association.—Visit to Lewes.—At the invitation of the Lewes and District Electric Supply Co., Ltd., the committee of the Association recently visited that company's generating station, which is of particular interest, inasmuch as it was the first electricity generating station in the country originally equipped with steam engines to have been completely converted to heavy-oil engine plant. At present the installation consists of three "English Electric" Diesel engines and one Mirrlees-Watson Diesel set. The last-mentioned engine has been in regular commission since it was first installed in 1908. The committee was afterwards entertained at luncheon by the directors of the company. Mr. C. G. Tegetmeier, chairman, referred to the very satisfactory progress that had been made by the Lewes Company during the last few years, which, he thought, was to be attributed largely to the economical working of the Diesel engines. Mr. A. W. A. Chivers, president of the Association, was pleased to see that the operating costs of the Lewes Company during the past year both with regard to lubricating and fuel oils, compared remarkably well with those of other undertakings, and he felt sure that it would be impossible to obtain such good results with any other form of plant or with bulk supply, having regard to local conditions and the characteristics of the load to be dealt with. The Electricity Commissioners' bulk supply policy could easily be carried too far and might result in the public having in certain cases to pay a higher price for their supply.

Incorporated Municipal Electrical Association.—Yorkshire Centre.—The Lord Mayor of York (Sir Robert Kay) extended, at a luncheon at the Mansion House on September 24th, a welcome to the members of the Yorkshire Centre of the Incorporated Municipal Electrical Association, who were holding their annual meeting in the city, twenty-four municipal undertakings in the Centre being represented. Mr. W. Rogerson (Halifax) president, acknowledged the welcome. The principal item on the programme was a visit to the hydro-electric station at Linton-on-Ouse, some twelve miles up the river from York. The visitors were shown over the station by Mr. E. J. Nichols, city electrical engineer, who was accompanied by the chairman of the Committee, Alderman C. Shipley. The annual meeting of the Centre at York later was held in private. Mr. W. Rogerson (Halifax) was re-elected president, Major Barker (Barnsley) vice-president, and Mr. H. G. Fraser (Wakefield) hon. secretary. The representation on the Yorkshire Centre Council was fixed as follows:—Large towns, Sheffield, Bradford, Hull; medium towns, Barnsley, Wakefield, Halifax; small towns, Batley, Bridlington, and Shipley. An invitation from the Grimsby Town Council to hold next year's meeting at Grimsby was accepted.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

The new Agecroft station of the Salford Corporation, the description of which is concluded in this issue, was designed by Mr. J. A. Robertson, of Manchester. Mr. Robertson, whose portrait appears herewith, was born in 1869. He entered the engineering industry by becoming an apprentice with James White (later Kelvin & White), of Glasgow. He became chief electrical engineer to Wm. Denny Bros., Dumbarton, and, later, was appointed assistant electrical engineer to the Stirling Corporation. In 1902 Mr. Robertson took over the position of chief electrical engineer at the Greenock municipal undertaking, and after a stay of 12 years transferred to the

Photo by] [*Lafayette, Manchester.*

Mr. J. A. Robertson, M.I.E.E., M.I.Mech.E.,
who was responsible for the construction of the Agecroft (Salford) station.

equivalent position at Salford, where he remained until 1922, when he resigned in order to devote the whole of his time to consulting practice. While at Greenock he erected the Dellingburn power station, and the Frederick Road station at Salford was modernised by him. Mr. Robertson includes a number of local authorities and private companies in his *clientèle*. One of his most recent undertakings is the Ribble power station at Preston. Mr. Robertson has been chairman of the Scottish and North-Western Centres of the Institution

of Electrical Engineers, and he is a member of the Institution of Mechanical Engineers.

Mr. S. J. Watson, the borough electrical engineer of Salford, to whose responsibilities that of the new Agecroft station has been added, is a native of Dover and was educated there. Upon leaving school he became a pupil with G. E. Belliss and Co., Birmingham (the predecessors of Belliss & Morcom, Ltd.), and later secured the position of assistant engineer with the Brush Electrical Engineering Co., Ltd. His connection with the electricity supply industry commenced with his appointment as station superintendent by the National Electric Supply Co., Preston. In 1896 Mr. Watson became engineer and manager of the Bury electricity undertaking, and in 1923 he was appointed to his present position. He was president of the I.M.E.A. for the 1917-18 session, and he has also been vice-president of the Institution of Civil Engineers, Manchester and District Association (1925), and chairman of the Manchester local section of the Institution of Electrical Engineers (1909).

Mr. S. J. Watson, M.Inst.C.E., M.I.E.E.
Borough Electrical Engineer of Salford.

Mr. S. Hann, the Stoke Newington Borough Electrical Engineer, who has been indisposed since the opening of the borough electricity showrooms and extensions and was granted leave of absence in July, is in Switzerland recuperating.

Mr. James D. Dow, for many years sales manager of the old Armorduct Manufacturing Co., Ltd., has now been appointed the managing director of the Anglo Electric Co., Ltd., which controls the sales of "Armorduct" cables.

On September 23rd, the St. Helens Town Council considered the resignation of Captain Vane-Moreland from the position of tramway manager. The chairman of the Tramways Committee said that Mr. Vane-Moreland had only been in office since November last, being appointed at a salary of £550. That was not sufficient to induce a suitable man, who besides being an engineer, must have knowledge and experience as a commercial man, to stay with them. The Corporation had had three managers in five and a half years. It was decided that applications for the vacancy be invited at a commencing salary of £650.

Mr. H. J. Barton Chapple, Wh.Sch., B.Sc., &c., is resigning his lectureship in Electrical Engineering (Radio Specialisation) at the Bradford Technical College, to join the senior technical staff of Radio Press, Ltd., Brush House, London.

Mr. George Hughes, C.B.E., chief mechanical engineer of the London, Midland & Scottish Railway, is shortly to retire. He will be succeeded by Sir Henry Fowler, K.B.E.

Mr. Guy Burney, late managing director of the Sterling Telephone & Electric Co., Ltd., has now returned from the Continent, and has opened offices at Morning Post Building, 346, Strand, London, W.C.2 (Telephone: City 2373). Mr. Burney proposes to interest himself in the development of patented articles—mechanical, electrical, and other kinds—and he will be pleased to hear from his old friends in the industrial world, and others desirous of placing any new invention before him.

Dr. G. C. Clayton, C.B.E., M.P., and Professor H. C. H. Carpenter, F.R.S., have been appointed to be members of the Advisory Council to the Committee of the Privy Council for Scientific and Industrial Research.

The Croydon Corporation Electricity Committee recommends the appointment of Mr. Lees, constructional assistant, as constructional engineer.

Mr. W. H. Peak, O.B.E., has been appointed managing director of the Sterling Telephone & Electric Co., Ltd., in succession to Mr. Guy Burney, who recently resigned, and Mr. Charles E. Hunter has succeeded the late Mr. Max R. Lawrence as works manager. We understand that Mr. Peak retains his position as managing director of the Relay Automatic Telephone Co., Ltd.

Mr. H. H. Spencer, who recently resigned his position as chief assistant engineer in the Glasgow office of Messrs. Crompton & Co., Ltd., has taken up a similar position with Messrs. F. & A. Parkinson, Ltd., in their London office, 47, Victoria Street, W.1. At a meeting of the Chelmsford Engineering Society, held on September 24th, Mr. Spencer was presented with a travelling clock on the occasion of his marriage. The presentation was made by the president (Mr. T. W. Cooper, M.I.Mech.E.) as a mark of appreciation of the work done by Mr. Spencer as secretary in the early days of the Society.

Obituary.—Prof. E. H. Barton, F.R.S.—We regret to record the death, which occurred suddenly on September 23rd, at Nottingham, at the age of 67 years, of Professor Edwin Henry Barton, Dean of the Faculty of Pure Science in the University College of Nottingham. He was the author of a number of text-books and a contributor to the scientific Press, as well as to the *Proceedings* of the Royal Society, the Physical Society, &c. *The Times* states that Prof. Barton had recently been busying himself with the plans for his department in the new University building which is being erected in University Park, Nottingham, by Sir Jesse Boot. Arrangements had been made for him to give a series of talks to be broadcast throughout the British Isles.

We are sure that many of our readers in the electrical profession and industry will desire to associate themselves with the Electrical Review in an expression of deep sympathy with Mr. A. H. Walton, M.Inst.C.E., of the British Thomson-Houston Co., Ltd., Crown House, Aldwych, W.C., in the loss of his wife. Mrs. Walton passed away on September 24th, after a few days' illness.

New Companies Registered.

Reflex Radio Co., Ltd. (208,575).—Private company. Registered September 23rd. Capital, £1,000 in £1 shares. Objects: To acquire the business now carried on by the Reflex Radio Co. at 45, Stamford Hill, N.16, and to carry on the business of manufacturers of and wholesale dealers in all electrical and mechanical appliances and scientific instruments (excluding sparking plugs), and all parts, fittings and accessories for these, but more particularly with regard to wireless telegraphy or telephony, &c. The life governing directors are:—A. T. Izzard, 118, Evering Road, Stoke Newington, N.16, radio engineer; R. E. Izzard, 198, Lower Clapton Road, Clapton, E., radio engineer. No share qualification required. Secretary: J. R. Homer, 45, Stamford Hill, N.16.

McGoff & Vickers, Ltd. (208,672).—Private company. Registered September 28th. Capital, £2,000 in £1 shares. Objects:—To carry on the business of electricians, electrical contractors, electrical, mechanical, and general engineers, manufacturers of electric or other motors, electric or other lighting sets, toys of all kinds, copper and brass founders, &c. The permanent directors are:—E. H. McGoff, 23, Fitzclarence Street, Liverpool; G. D. Vickers, "Rookwood," St. Helens Road, Ormskirk; A. Piggott, "Arranmore," Latham, Burscough; W. S. Roberts, "Newby," Ruff Lane, Ormskirk; and H. Chappell, Ruff Lane, Ormskirk. The first two named are managing directors. Qualification, 200 shares. Solicitor: James Roberts, 5, Harrington Street, Liverpool. Registered office: 12, Johnson Street, Liverpool.

Official Returns of Electrical Companies.

Whitfield Electrical Co., Ltd.—Debenture dated August 29th, 1925, to secure £2,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Mrs. C. Page, 15, Buckingham Mansions, Hampstead, N.W.

Quead, Ltd.—E. A. Hurpham, of the Commercial Trades Protection Association, 133, Finsbury Pavement, ceased to act as receiver or manager on September 17th, 1925.

British Illuminated Signs, Ltd.—Satisfaction in full on September 11th, 1925, of mortgage by debenture dated December 6th, 1923, and mortgage collateral thereto dated December 20th, 1923, securing £500.

Nordisk Electrical Power Co., Ltd. (140,530).—Return dated December 31st, 1924 (filed August 5th, 1925). Capital, £10,000 in £10 shares. All shares taken up. £20 paid. £9,980 considered as paid. Mortgages and charges, nil.

Nathan & Allen, Ltd. (174,343).—Return dated June 8th, 1925. Capital, £10,000 in £1 shares. 3,450 shares taken up. £1,100 paid. £2,350 considered as paid. Mortgages and charges, nil.

E. & C. Gates, Ltd. (172,187).—Return dated December 31st, 1924 (filed May 8th, 1925). Capital, £3,000 in 2,700 preference and 300 ordinary shares of £1 each. 1,011 preference and 300 ordinary shares taken up. £723 paid on 723 preference shares. £588 considered as paid on 288 preference and 300 ordinary shares. Mortgages and charges at date of return, nil. Since registered: Series of debentures for £4,000, authorised and all issued April 7th, 1925.

F. B. Hellon & Co., Ltd. (173,480).—Return dated June 17th, 1925. Capital, £4,000 in £1 shares. 3,000 shares taken up. £3,000 paid. Mortgages and charges, nil.

Caffin & Co., Ltd. (173,927).—Return dated June 5th, 1925. Capital, £25,000 in £1 shares. 16,002 shares taken up. £8,502 paid. £7,500 considered as paid. Morgages and charges, nil. Return of allotments made up to June 9th, 1928, shows a further 500 shares allotted for cash.

C. T. Briscoe & Son, Ltd. (173,926).—Return dated March 11th, 1925. Capital, £5,000 in £1 shares. 2,000 shares taken up. £110 paid. £1,890 considered as paid. Mortgages and charges, £1,000.

Premier Private Telephone Co., Ltd. (174,408).—Return dated August 4th, 1925. Capital, £2,000 in £1 shares. 1,200 shares taken up. 15s. per share called up on 800 shares. £575 paid, leaving £25 in arrears. £400 considered as paid on 400 shares. Mortgages and charges, £308 6s. 8d.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Halifax and Bermudas Cable Co., Ltd. The report for the year ended June 30th last states that there was a balance on working of £18,999, as compared with £21,654 in 1923-24. The addition of £43,626 from the previous year makes available £62,625. The deduction of expenditure on repairs and the interim dividend leaves £47,291. It is proposed to pay a further dividend of 5 per cent., free of tax, making 10 per cent., tax-free, for the year, and to carry forward a balance of £44,791. The company's cable was interrupted on two occasions during the year, and faults developed in the shore ends at Halifax and Bermuda. The cable is now in first-class condition, and should be free from interruption for a long period.

Indian Companies. *Tata Hydro-Electric Power Supply Co., Ltd.*—Mail dispatches from Bombay state that the net profit for the year ended June 30th last was Rs. 25 lacs, subject to adjustment on final audit, after making the usual allowance for depreciation and income tax. The issued capital of the company is Rs. 2,80,00,000.

The net profit of the *Andhra Valley Power Supply Co., Ltd.*, for the year ended June 30th last was Rs. 17 lacs, subject to adjustment on final audit and to provision for depreciation. The issued capital of the company is Rs. 2,10,00,000.

German Companies. The *Rheydt Cablé Works Company* contemplates the distribution for 1924 of a dividend at the rate of 15 per cent. on the old shares and 7½ per cent. on the new capital.

The directors of the *Dr. Paul Meyer Company*, of Berlin, report a loss of 508,000 marks for 1924, which is partly covered by the reserve fund. The demand during the year was small, and it was impossible to get remunerative orders; it was found necessary to accept orders at unfavourable prices so as in some measure to keep the works in operation and maintain connections.

The report of *Garbe, Lahmeyer and Company*, of Aix-la-Chapelle, states that ruthless competition prevailed in 1924-25 so that the sale prices did not cover the costs of production. Efforts, however, were made to simplify manufacturing in order to cheapen the prime costs. After having made provision for depreciation the accounts show a loss of 521,000 marks, which has been carried forward.

The *Transradio Company for Transmarine Communication*, of Berlin, reports that the course of business in the current year is favourable, particularly with Argentina. Communication with the East Indies (Java) has recently been opened, while next year the large station in Rio de Janeiro will be inaugurated for traffic with Brazil. In these circumstances it is assumed that a satisfactory dividend may be reckoned upon.

Direct West India Cable Co., Ltd.—The net result of the past year's working was a credit balance of £12,233, as against £11,249 in 1923-24. To this is added £28,026 brought forward, making £40,259, and the deduction of the interim dividend and repair expenses leaves £24,537. It is proposed to pay a final dividend of 5 per cent., free of tax, making 10 per cent. (tax-free) for the year, and to carry forward £21,537. There were four interruptions in the company's cables during the year, but they should now be free from further interruption for a considerable time.

American Water Works and Electric Co.—It is proposed to form a new company under the title of the West Penn Electric Co. to consolidate the electrical subsidiaries of this company. The new company will acquire the preferred and common stock of the West Penn Co. and the common stocks of the Potomac Edison Co. and the Keystone Power and Light Co. The capital will consist of 500,000 first preferred $100 shares, 59,258 "Class A" shares, 165,742 "Class B" shares, and 1,000,000 common shares of no par value.

Chadburn's (Ship) Telegraph Co., Ltd.—The report for the past year shows a loss of £1,375, as compared with profits of £1,202 in 1923-24 and £7,454 in 1922-23. The directors state that they are unable to recommend an ordinary dividend. The preference dividend is paid from the balance brought forward, and £1,445 is carried to the next account.

Sir W. G. Armstrong, Whitworth & Co., Ltd.—In a circular to the shareholders, the directors state that as the cash requirements of the company have been heavy, it is necessary to conserve the cash resources. Accordingly, it has been decided to pay no interim dividends in respect of the current year, except on the first cumulative preference shares.

Stock Exchange Notice.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Shropshire, Worcestershire and Staffordshire Electric Power.—7,830 six per cent. cumulative preference shares of £1 each, fully paid, Nos. 1,127,376 to 1,135,205.

Adelaide Electric Supply Co., Ltd.—In August 250,000 eight per cent. preferred ordinary shares of £1 each were issued to existing ordinary and preferred shareholders in the proportion of one new share for each three held.

Consolidated Gas, Electric Light & Power of Baltimore.—The dividend on the common stock has been raised to 62½ cents per share.

Shanghai Electric Construction Co., Ltd.—The directors have declared a first interim dividend of 3 per cent. (as against 6 per cent.).

Cuba Submarine Telegraph Co., Ltd.—A dividend at the rate of 5 per cent., free of tax, has been declared in respect of the first half of the current year.

Stocks and Shares.

Monday Evening.

Anyone who has had practical experience of the working of a rubber boom will understand the physical and mental strain imposed upon those Stock Exchange members who happen to be thrown into the midst of the vortex which courtesy still dignifies by the name of "market." Other matters have to be hastily pushed on one side. The human machine goes on working as long as it can. The market in the Stock Exchange resembles, in a *coup d'œil* from the roof of the House, a closely-wedged mass of animated corks, hundreds of heads bobbing up and down excitedly upon the unceasing maelstrom of the whirl of the boom. Other markets are relegated to the background of public interest. Changes in our this week's price-list testify, by their unimportance, to the neglect with which clients are regarding aught but the popular shares of the moment.

Districts fell 2½ points last Friday, to 40 middle, a price which brought in the speculative buyer, whose purchases served to rally the quotation to 41½. At the latter figure, the stock returns 8½ per cent. on the money, on the basis of the 1924 dividend of 3½ per cent. Metropolitans weakened to 64½, and Underground £10 shares to 2⅛. The less familiar London Electric Railway ordinary stock changed hands at 41 a few days ago, and this is a cheap-looking stock, whose main disadvantage lies in its unmarketability.

In electricity supply shares, Kensingtons have again put on 5s., which makes the price 12⅝. Except for this, no alteration has occurred amongst the London group of shares. Electric Supply Corporation ordinary have recovered their dividend. So have Whitehall preference. Clyde Valley shares eased off to 28s. 6d.

The Power & Traction Finance Company has received an important contract for electrical power works projected in Greece. It is thought that the financing may be undertaken under the provisions of the Trade Facilities Act.

Wireless shares exhibit a fair degree of liveliness, Canadian Marconis being the chief centre of attention. Curiosity is agog as to what may be the true inwardness of a demand which originated in Canada. A well-known Stock Exchange jobber, closely identified with wireless interests, sailed last week for Montreal upon a mission said to be connected with reasons other than those of health and pleasure. The price of the shares is 6s. 4½d. middle, and the parent Marconis hold their advance at 28s. 9d.

Cable stocks incline to dulness. Anglo-American preferred and deferred are both a little lower. The Eastern division is steady. Halifax and Bermuda has declared a tax-free dividend of 5 per cent., making 10 per cent. for the year. Direct West India ordinary shares are to receive the same, which also makes 10 per cent. for the full twelve months. Similar dividends were paid, in both cases, for the previous year. Chadburn's (Ship) Telegraph reports a loss of £1,375, and, in making the announcement, the directors express their regret that for the first time in the history of the company, they cannot recommend a dividend on the ordinary shares. Last year the latter received 3 per cent., and in the previous half-decade, their dividend was 6 per cent. per annum. The preference dividend has been duly met. The ordinary shares stand nominally at 10s.; shares last changed hands at 7s. 6d., on September 24th. No dealings are officially recorded in the 6 per cent. preference since July 1st, when a bargain was marked at 13s. 9d.

Southern Brazil Electric 6 per cent. bonds have put on several points at 54, but Brazilian Tractions reacted to 74. In Mexicans, the movements are somewhat mixed, as usual, Mexico Tramways Fives being better at 73½, Mexican Light and Power issues going back. Rumours suggest that the revolutionary spirit still smoulders amongst some of the banditti in that distressful country. British Electric Traction stocks retain their substantial rises.

Edisons are a few pence lower at 8s. 9d. Cable construction descriptions are unaltered on the week, the rubber activity having no further effect. Automatic Telephones remain at 47s. 6d. International Automatics are quiet at 28s. 6d. Iron and steel shares gave way upon the decision of the Armstrong-Whitworth board to postpone payment of the interim dividends on the company's junior preference shares. Babcocks remain at 2½, but the market as a whole is disturbed and uneasy at this latest manifestation of the unsatisfactory condition of trade in the "heavy" industries.

Proposed Manchester Tube.—A new proposal to deal with the traffic problems of Manchester by means of an underground railway was put forward by Ald. Bowie at a meeting of the North-Western Section of the Institute of Transport on September 25th. The suggestion was that an inner ring should be constructed with a central station in Piccadilly, and that from this the outside areas should be served by a number of branches. The population was large enough to justify the scheme, for it was about the same as that of central London when the first tubes were constructed there—some three millions within a radius of 12 miles from the centre of the city. The speaker said that the cost was estimated at between £250,000 and £300,000 per mile, the geological formation being favourable to construction.

High-voltage Submarine Cable.—Since 1914 the North Sealand (Denmark) Electricity Co. has received a supply of energy from the Swedish hydro-electric works at Lagan, in Halland, through a submarine cable at 25,000 volts, which is laid under the Sound. It was decided some time ago that the pressure should be raised to 50,000 volts, but it was only this year that definite work in the direction of the execution of the scheme was decided on by the electricity company by the establishment of a 50,000-volt line between Sweden and Copenhagen. This has now been carried out in connection with the Southern Swedish Power Co., of Malmo, the town of Fredriksberg, and the city of Copenhagen, which in combination have participated in the total expenditure, which amounts to over 2,000,000 kr. The cable, which is of the three-phase type, has been supplied by a German firm, is 2.89 miles long, and was made in six lengths. The laying of the cable took place between June 28th and July 22nd, and the land-line extension to Copenhagen was then proceeded with.

The Institution of Public Lighting Engineers.

Annual Conference at Leeds.

(*Continued from page* 516.)

On Tuesday, September 15th, the visitors were the guests of the Leeds Gas Committee at luncheon at Leeds Town Hall, where Alderman George Ratcliffe, J.P., chairman of the Gas Committee, presided over a very large gathering.

The toast of "The City of Leeds" was proposed by Sir Albert Ball, of Nottingham. The Lord Mayor of Leeds (Councillor C. G. Gibson) responding, claimed that the Electricity Department was second to none in Yorkshire. In it there was no unit of plant which was older than 1913, and in all they had nearly 100,000 lamps there. They had also a tramway with about 120 miles of single line and contributed nearly £90,000 to the relief of the rates. Alderman Charles Lupton, responding as chairman of the Leeds Housing, Sites, and Improvements Committee, spoke of the great importance of the relative values of gas and electricity in the new housing schemes and in the lighting of the roads serving those houses. When he needed absolutely impartial guidance he sought help from the Fuel Research Department of the Leeds University, which was doing valuable work. Councillor John Arnott (Lord Mayor-elect of Leeds) also responded.

Alderman George Ratcliffe, J.P., chairman of the Leeds Gas Committee, in giving the toast of "The Institution of Public Lighting Engineers," congratulated Mr. Shapley on his new honour, and said that in Leeds the electrical and gas departments worked in complete harmony in the public lighting interest. Mr. Shapley, responding, thanked the members of the Lighting and Gas Committees for the facilities granted to the Conference, and the Corporation generally, for its approval and support. Mr. S. B. Langlands, ex-president of the Institution, also responding, said there could be no quality in street lighting, and they must go on from brightness to brightness.

Councillor E. J. Clarke, chairman of the Leeds Lighting Committee, briefly proposed "The Guests," and Alderman J. H. Waddington, Mayor of Halifax, for many years chairman of the Halifax Gas Committee and vice-chairman during his mayoralty, responding, said that, although he was primarily a gas man, he never regretted that so much had been said of gas at its function and so little of electricity. In all fairness they had to recognise that the future of lighting in our cities, towns, and villages, both in the streets and in the buildings, must to a great extent be left to the electrical side of lighting service. To his mind, as a strong enthusiast for gas, there was no competition to-day with electricity for lighting. On the other hand, when it came to heating, and some aspects of power, he contended that gas held a wonderful first place.

Alderman W. Wilkie, J.P., chairman of the Newcastle-upon-Tyne Lighting Committee, said he had come with Councillor Oates, the Lord Mayor-elect of Newcastle, to invite the Institution to hold its next Conference at Newcastle.

On the resumption of the conference on the morning of September 16th, the delegation from Newcastle formally extended its invitation to that city, which was accepted with thanks.

Mr. Edward C. Lennox, of the Durham County Electrical Supply Co., then threw on the lantern screen a number of views illustrating points in his paper on "Electric Street Lighting in Rural Areas," and the paper was discussed.

Mr. J. S. Thomas, D.Sc., submitted a paper contributed by the Distribution Department of the South Metropolitan Gas Co., and illustrated by a considerable number of lantern views. A discussion followed.

As a result of the election of officers and Council, the following was announced by the secretary as the list of new officers of the Institution:—President, Mr. C. S. Shapley, Leeds; vice-president and president-elect, Mr. R. Davison, Newcastle-on-Tyne; hon. treasurer, Mr. E. M. Severn, London; hon. secretary, Mr. W. J. Liberty, City of London; editor, Mr. E. J. Stewart, Glasgow.

Thanks were accorded to the Lord Mayor and the Lighting and Gas Committees of Leeds for their hospitality; to the president; to the retiring officers and Council; and to the authors and readers of the papers

Presidential Address.

By C. S. Shapley.

(*Abstract.*)

The lay-out of Leeds is difficult from a street-lighting standpoint. The industrial portion is very congested, while the population about two miles from the centre becomes sparse. There are fifteen main arterial roads radiating from the centre; and there are many important roads connecting these arterial roads, which are also very sparsely populated.

We employ in the centre of the city an electric controller which combines three operations in one clock—namely, lighting, checking, and extinguishing. Six of these are in use, controlling 53 lamps, varying in wattage from 300 to 1,000. There are also 58 controllers of the on-and-off type, operating 258 lamps, varying from 200 to 300 watts—making the total number of lamps controlled by time switch 303. The remaining 413 lamps are hand-operated from 53 switch boxes.

A tower motor derrick is kept for general use, and this is at call at any hour for breakdowns. For general maintenance, four hand derricks, each serving 174 lanterns, are employed, and two men per derrick are responsible for the work.

All steel suspension wires and overhead work are examined annually. Steel cables are put to severe test, and coated with a mixture of graphite and vaseline, care being taken that the whole of the wire is coated.

The city is divided into five districts, each controlled by an inspector, who is required to be on his district at lighting and extinguishing time. He patrols one run a week with a lighter, is responsible for the efficient lighting of his district, the supervision of repairs, and the pruning of trees, and has to report on alternate days to the head of the Department. One male and one female clerk, and part-time assistants from the Gas Department, do all the clerical work.

In the choice of lighting, level or uniform density of ground illumination is generally accepted as the ideal. On the other hand, what I should term bright-spot illumination has its supporters; and a strong argument advanced in favour of the latter method of illumination, as compared with level illumination is the pleasing and decorative effect obtained. Added to this is the definite and stimulating influence a bright source of light has on the user of the road. With level illumination, these important factors are very much less pronounced. The lighting may appear monotonous, lacking in contrasts, and rather gloomy. This comparison is probably more noticeable where the light sources for each system are of equal candle power, and the method of obtaining level illumination is by directional light beams obtained by the use of refractors.

I had some experiments carried out in order to compare the lighting of one of our main thoroughfares, when using bright-spot illumination and level-ground illumination obtained by directional beam lighting; and, frankly, I was disappointed with the results of the latter. In this particular case the greater portion of the re-directed light beams was wasted. There was a brilliant band of illumination half-way up the buildings on both sides of the road. The system of illumination by directional light beams was tested on the photometer bar; the curves of the test are shown in fig. 1. The curves 2, 3, 4 and 5, are of lamps fitted with refractors, and curve 1 of a lamp without that device. The ground illumination curve of the lamp with and without the refractor shows graphically that the increase of illumination half-way between the lamps does not compensate for the loss below the lamps. The loss is explained by the concentrated light beams near the horizontal (which are only useful in two directions for street illumination) being made to radiate in all directions. For lighting thoroughfares where the distances between the lamps are necessarily great, one can foresee definite advantages associated with directional beam illumination.

I find it is sometimes an advantage in street lighting to sacrifice illumination for effect; and in Lower Briggate, some gas-filled clear lamps were replaced by opal lamps of the same candle power, with pleasing results. "Even" or "level" ground illumination was a big claim for the particular type of

lamps used; but in the street tests made this claim was not substantiated. The good results obtained from the opal lamps are, in my opinion, due to the bigger area of the source of light, which creates an impression of higher candle power, although it is actually less, as some of the light is absorbed by the opal globe. The lights are brilliant, but not glaring; and the intrinsic brilliancy per sq. in. of globe area is approximately 20 candles. Intensities below this would probably not be so effective. The loss in ground illumination compared with that obtained from a gasfilled clear lamp is comparatively small. The general lighting effect, judged by observation, and not by photometric methods, would appear to be superior to that obtained from gasfilled clear lamps of equal candle power.

With respect to the dazzle effect of bright sources of light, this is not a simple question of brilliance, but of contrasts, and depends chiefly on the observer. Personally, I have not experienced dazzle in the ordinary passing observation one gives to a street lamp, even with the highest candle power units. The loss of vision caused by dazzle (say) from the headlights of a motor-car, is due to the fact that the contrast between the brilliancy of the headlights and the surrounding illumination is too great. The same blinding effect is experienced on going from daylight into a darkened room, though the room may appear quite light when the eyes have become accustomed to the gloom. In this case it is the eyes which are unable to adapt themselves to the sudden contrast. In our street lighting the increase and decrease of illumination to and from lamps is not sufficiently contrasting to interfere seriously with vision, except in isolated places where buildings and obstructions cause deep shadows; and, speaking generally, I think that dazzle in street lighting is more imaginary than real.

The most suitable height at which to fix certain types of lamps in order to obtain the best results was a problem which arose in respect of some special street lighting which we were contemplating. We experimented with a 3-light and a 4-light lamp. The lamps were fixed on 12-ft. columns, and horizontal illumination tests were made at 3 ft. above ground level.

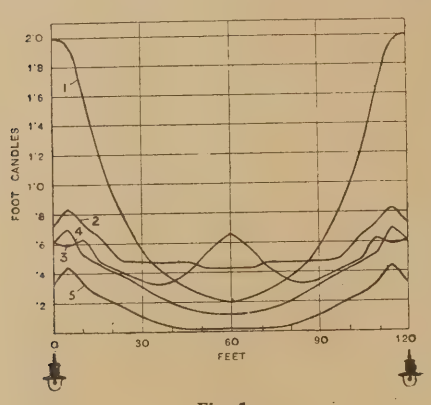

Fig. 1.

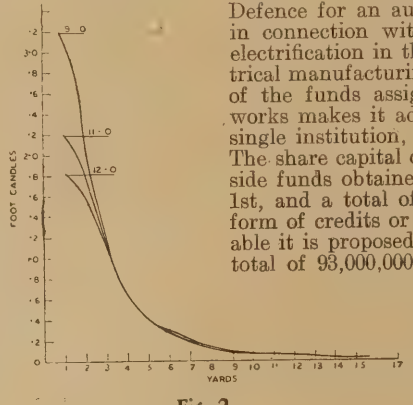

Fig. 2.

An interesting feature to be noted from the curve, fig. 2, is that the horizontal illumination with the 4-light lamp, except within very narrow limits from the base of the lamp, is practically the same for different heights of columns. From the point of view of horizontal illumination with lamps of the above type, the height, within limits, is apparently immaterial. Therefore, any decision in this respect would be influenced chiefly by a knowledge of the locality for which they were intended and considerations of visibility and interference with the line of vision.

In the testing of street lighting the usual standard of comparison is the horizontal illumination; but in my opinion this leaves much to be desired. Horizontal illumination is least influenced by reflected light from buildings and other objects in the vicinity of the lamp, which are factors of sufficient importance to have had some influence in the choosing of the lamp for that particular locality. Pedestrians and any objects in the road are seen chiefly by silhouette and by reflected light from a vertical plane, the reflected light from the horizontal plane playing a part, but not the most important part, in securing visibility. It will be recognised that gradients and the colour of the road surface influence illumination to a considerable extent, and consequently can be considered important factors in the scheme of lighting. In the method of taking horizontal illumination tests, these factors are ignored, the illumination being measured on a white card held in a horizontal position, which is not a true measure of the available illumination.

In taking illumination determinations, we use a lumeter, but its value is very limited, as readings below 0.01 foot-candle are not reliable, though at this illumination definite shadows are produced. In the Jackson Avenue tests observations could only be taken up to a distance of 14 yards from the base of the lamp. This left approximately 45 yards between the lamps where it was impossible to take a reading, though there was distinct illumination in that area; it would be interesting to know if there is an instrument reliable for readings below 0.01 foot-candle.

I think I have demonstrated that my leaning to a bright, cheerful source of light is justified. I would, however, emphasise that street lighting calls for common sense and initiative, in order to give service to the public, and to provide adequate lighting for personal safety—always having regard to economy.

The Exhibition.

An exhibition of lighting appliances was held in the great hall of the Leeds Town Hall throughout the period of the Conference, and was supplemented by sections of street lighting in the city which were allocated to various lamp and control manufacturers for the temporary use of their fittings as a practical demonstration of their worth in normal street lighting. The electrical exhibitors were: Siemens & English Electric Lamp Co., Ltd., showing weatherproof street lanterns, reflectors, anti-vibration disks, &c.; Venner Time Switches, Ltd., two principal types of electric time switches with fifteen-day or six-week clocks, according to size, and various types of housing to suit different local conditions; Foster Engineering Co., Ltd., electric lamps, &c.; General Electric Co., Ltd., electric lighting appliances; Photector Co., Ltd., the "Dia" long-burning flame arc lamp and the "Photector" street-lighting lanterns; Cable Accessories Co., Ltd., electric light fittings; Cryselco, Ltd., opal-type gasfilled electric lamps for street use; British Thomson-Houston Co., Ltd., lanterns as in use in Leeds streets, and "Mazda" lamps; Edison Swan Electric Co., Ltd., anti-vibration fitted electric street lanterns of various classes; Holophane, Ltd., street refractors, two- and four-way, ornamental and otherwise.

In addition to many makers of gas appliances, the following firms showed lighting accessories:—Charles Steel, glassware, paints, and varnishes; Wardle Engineering Co., lamps, globes, &c.; and Donald MacPherson & Co., Ltd., paints, varnishes, and enamels for lamp standards.

(To be continued.)

Russian Electrical Notes.

The Electrical Bank.—The directors of the Electrical Bank have made application to the Council of Labour and Defence for an augmentation of the capital of the Institution in connection with the growing importance of the work of electrification in the country, and the development of the electrical manufacturing industry. It is held that the insufficiency of the funds assigned through the budget for electrification works makes it advisable for these funds to be entrusted to a single institution, and not divided among the different banks. The share capital of the bank is 8,000,000 roubles, and the outside funds obtained amounted to 35,000,000 roubles on August 1st, and a total of 34,000,000 roubles has been granted in the form of credits or loans. If the necessary funds become available it is proposed, in 1925-26, to grant credits and loans for a total of 93,000,000 roubles, of which 12,000,000 roubles would be for the re-equipment of the manufacturing industry, 10,000,000 roubles for rural electrification, 12,000,000 roubles for local electrical construction works, and 15,000,000 roubles for initial works in connection with the erection of new regional stations. Moreover, the bank is faced with the question of financing the importation of electrical manufactures from abroad as the Soviet manufacturing industry does not develop as rapidly as the growth in the demand for electrical goods.

The Weak-Current Trust.—This Trust, whose chief manufactures are telephone and radio apparatus, has brought forward its productive programme for the year beginning on October 1st. The gross output will amount to 16,300,000 (pre-war) roubles, showing an increase of 94 per cent. over 1924-25. Telephone and telegraph apparatus will be turned out to the same extent as in the expiring year, while the output of measuring apparatus is to be increased by 50 per cent., and that of meters by 180 per cent. As the production outlined will be 40 per cent. in excess of the capacity of the works, it is intended to overcome the deficiency by carrying out extensions and the provision of new equipment, which will necessitate the expenditure of 4,300,000 roubles. The working capital will also be insufficient, and a grant of 4,422,000 roubles is asked for by the trust. It is intended to increase the number of persons employed by 71 per cent. to 8,270, and the average wages will be raised by 10 per cent., while the costs of production are expected to be reduced by 8 per cent.

The Electrical Market.—The condition of the electrical market at the beginning of September is stated to have been very animated. A large demand prevailed for stock manufactures and those for delivery in the near future until the close of the building trades season. Cables were in good request, particularly for State industries, as also were copper wire, conductors, flexible cords and other installation materials, while the calls for the supply of lamps were being filled generally by home production. Motors were in great demand, especially sizes up to 40 h.p., and second-hand motors repaired in the shops were being sold at slightly above pre-war prices. The products are being offered principally by the trusts, the part played by other trading organisations in the matter last year having now been greatly reduced, and private firms now only occupy an inconsiderable position in the market.

Electricity Supply in Leningrad.—The programme of the Elektrotok (the Electricity Supply Undertaking at Leningrad) provides for an output of 260,000,000 kWh in 1925-26, or an increase of 35 per cent. over the current year's production. It is proposed to receive 20,000,000 kWh from the Volkhoff station, and a beginning is to be made with the construction of the new peat fuel station, and the erection of a new 10,000-

kW turbo-generator at the Krasnaya Oktyabr station. Altogether it is proposed to expend 7,689,000 roubles on constructional works next year, and in order to complete the programme a loan of 4,000,000 roubles will have to be granted to the Elektrotok.

The Ukraine.—The committee dealing with the electrification of the Ukraine has approved a report deciding that the local electrical committee in the Ukraine should be wound up and be replaced by a district Electric Planning Commission, and that the General Electric Commission should provide the funds for the maintenance of such a commission for that republic.

The Schatur Station.—The inauguration of this station, which is to employ peat as fuel is expected to take place shortly, when the second generating set will be put into operation. Besides making an addition to the supply of Moscow and region, the new works will furnish energy to a number of industrial works. The existing temporary plant will then be shut down, and transferred to the Lyapinsk station now under construction near Yaroslav. The stocks of peat accumulated at the Schatur station amount to 321,000 tons, and will ensure an adequate fuel supply for one year.

Funds for Communal Power Stations.—The National Commissariat of Finance has confirmed an application made by the Central Bank for Housing and Communal Construction for the handing over to the bank of the funds assigned in the State budget for the construction of communal power stations. In 1925-26 it is proposed to finance local stations by the grant of loans for a fixed period of not more than five years at the rate of 6 per cent., of which 5 per cent. would be allotted to the State, and the remaining one per cent. to the bank.

Accumulator Production.—The North-Western Industrial Bureau has confirmed the productive programme of the Accumulator Trust for the year beginning with October 1st. It is proposed to increase the output by 52 per cent. over the current year's production, while batteries for railway purposes only will be augmented by 185 per cent.

Electrical Exports of the United States.

Below are shown the values of electrical machinery and apparatus exported from the United States during the twelve months ended June last. Comparative figures for the twelve months ended June, 1924, are added and notes of increases or decreases also given.

	Twelve months ended June, 1924. Value. $	June, 1925. Value. $	Inc. or dec. $
Electrical machinery and apparatus (total)	68,800,000	66,871,000	−1,929,000
Generators—			
Direct current—			
Under 500 kW	939,000	876,000	− 63,000
500 kW and over	704,000	551,000	− 153,000
Alternating current—			
Under 2,000 kVA	146,000	219,000	+ 73,000
2,000 kVA and over	1,195,000	1,115,000	− 80,000
Steam turbine generator sets	10,000	429,000	+ 419,000
Accessories and parts for generators	1,321,000	1,079,000	− 242,000
Self-contained lighting outfits	652,000	879,000	+ 227,000
Batteries—			
Flashlight batteries	476,000	1,065,000	+ 589,000
Other primary batteries	989,000	941,000	− 48,000
Storage batteries	2,686,000	2,661,000	− 25,000
Transforming or converting apparatus—			
Power transformers	3,937,000	2,086,000	−1,851,000
Other transformers	1,981,000	1,525,000	− 456,000
Rectifiers, double-current and motor generators, dynamotors, synchronous, and other converters	1,076,000	1,110,000	+ 34,000
Transmission and distribution apparatus—			
Switchboard panels, except telephone	2,069,000	2,018,000	− 51,000
Switches and circuit breakers over 10 amps.	2,138,000	1,835,000	− 303,000
Fuses and fuse blocks	333,000	284,000	− 49,000
Watt-hours and other measuring meters	659,000	486,000	− 173,000
Volt, watt and amperemeters, and other recording, indicating and testing apparatus	1,204,000	1,565,000	+ 361,000
Lightning arresters, choke coils, reactors, and other protective devices	918,000	646,000	− 272,000
Motors, starters, and controllers—			
Motors under 1 h.p.	1,683,000	1,703,000	+ 20,000
Stationary motors—			
1 to 200 h.p.	3,155,000	1,957,000	−1,198,000
Over 200 h.p.	936,000	443,000	− 493,000
Railway motors	1,483,000	825,000	− 658,000
Electric locomotives—			
Railway	1,956,000	1,210,000	− 746,000
Mining and industrial	345,000	240,000	− 105,000
Other motors	†120,000	—	—
Starting and controlling equipment	†991,000	—	—
For industrial motors	*877,000	1,101,000	—
For electric railway and vehicle motors	*83,000	141,000	—
Accessories and parts for motors	2,086,000	1,776,000	− 310,000
Electrical appliances—			
Electric fans	1,109,000	812,000	− 297,000
Electric lamps—			
Metal filament	1,101,000	1,135,000‡	+ 34,000
Other electric lamps	331,000	335,000	+ 4,000
Flashlights	629,000	1,056,000	+ 427,000
Searchlights and projectors	404,000	431,000	+ 27,000
Motor-driven household devices	889,000	1,040,000	+ 151,000
Domestic heating and cooking devices	1,055,000	1,231,000	+ 176,000
Industrial electric furnaces and ovens	269,000	225,000	− 44,000
Therapeutic apparatus, X-ray apparatus, galvanic and faradic batteries, &c.	989,000	1,192,000	+ 203,000
Signal and communication devices—			
Radio apparatus	4,062,000	8,273,000	+4,211,000
Telegraph apparatus	446,000	553,000	+ 107,000
Telephone apparatus—			
Magneto telephones	191,000	173,000	− 18,000
Other telephones	657,000	400,000	− 257,000
Telephone switchboards	936,000	987,000	+ 51,000
Other telephone equipment	1,059,000	2,440,000	+1,381,000
Railway signals, switches, and attachments	1,028,000	920,000	− 108,000
Bells, buzzers, annunciators and alarms	126,000	171,000	+ 45,000
Other electrical apparatus—			
Spark plugs, magnetos, and other ignition apparatus	2,127,000	2,247,000	+ 120,000
Insulating material	1,591,000	1,440,000	− 151,000
Metal conduit, outlet, and switch boxes	547,000	655,000	+ 108,000
Sockets, receptacles and lighting switches	1,184,000	1,353,000	+ 169,000
Electric lighting fixtures, interior and street	321,000	990,000	+ 669,000
Other wiring supplies and line material	1,629,000	1,011,000	− 618,000
Electrical apparatus n.e.i.	8,973,000	7,036,000	−1,937,000

* January 1st—June 30th. † July 1st—December 31st.

‡ Electric lamp exports were distributed as follows:—Europe, $38,000; Canada, $37,000; Central America, $83,000; Mexico, $223,000; British West Indies, $22,000; Cuba, $203,000; Argentina, $93,000; Brazil, $26,000; Chile, $52,000; other South American Countries, $75,000; Australia, $129,000; New Zealand, $20,000; British South Africa, $33,000; other countries, $99,000.

Electric Heating "Mystery."—According to the *Electrical World*, the greatest stumbling block in the way of more rapid progress in the application of electric heating is the reluctance of manufacturers and users of the apparatus to publish details. "There is a tendency on the part of many heating engineers to throw a cloak of mystery about the methods used and the results obtained with industrial electric heating. When selling appliances to the user the impression is created that a special secret process has been evolved for his sole purpose. True, most electric heating jobs require special treatment and apparatus, but after the installation has been made the user is more inclined to tell about the improvements he has effected than is the engineer or manufacturer who designed and built the equipment. . . . Specialists who withhold data or harbour the belief that they possess certain trade secrets hamper the growth of the business by creating doubt of the merits of a process about which there appears such a dearth of accurate information."

The Municipal Tramways Association.—III.

Annual Conference at Brighton.

Tramway Finance: Capital Outlay: Application of Surplus Revenue.

By Alderman R. A. Smithson, J.P. F.C.A.

(*Abstract.*)

Since 1918-19 great changes have occurred. The capital expended by local authorities on tramways has increased by £14,824,535, or 26.23 per cent.; the revenue by £5,823,555, or 32.35 per cent.; and the working expenses by £5,384,857, or 40.89 per cent. The revenue per route mile has advanced from £10,870 to £12,954, or by 19 per cent. The effects of the war on the growth of revenue, due to increased fares, and in the working expenses, owing in a large measure to increased wages, are thrown into prominence. The revenue is now more than double what it was in 1912-13, whilst the route miles have increased by less than 18 per cent. On the other hand, the working expenses have increased by 172 per cent. The change in the financial policy and circumstances of local authorities is shown by the fact that while in 1912-13 tramways were assisted by the rates to the extent of £64,988, and contributed in rate-aid £519,715, in 1923-24 they received from local taxation £256,777, and contributed in reduction of it £280,537. In the year 1924-25 34 local authorities raised in rates for tramways the sum of £425,217 (of which seven authorities provided £339,704), and 22 local authorities derived £269,952 in reduction of rates. The amount paid for rates between 1912-13 and 1923-24 increased from £458,317 to £879,980, of which 75 to 80 per cent. was paid in respect of the permanent way. One striking feature is the amount placed to reserve and depreciation funds. It increased from £733,749 to £1,688,405. The total amount set aside in these funds during the last six years was no less than £8,063,132, while the whole sum applied in debt redemption or transferred into sinking funds for that purpose was £9,883,122.

In relation to capital, local authorities differ fundamentally in their financial arrangements from companies. The former must redeem their loan indebtedness, and at the same time maintain their undertakings in an efficient condition. They have thus a burden cast upon them which companies (that as a rule cannot redeem much of their capital) do not have to bear. A municipality may both restore and acquire its capital by the simultaneous operation of renewals and redemption funds. Only in exceptional cases, such as the construction of waterworks or large electricity stations, are they allowed to postpone the commencement of redemption funds. I find that of the total outlay on tramways, £28,653,200 has been spent on the permanent way; £11,029,308 on cars; £6,040,284 on electrical equipment of line; and £3,564,011 on street improvements.

Parliament commonly granted in previous years 30 years for the repayment of permanent way debt, 15 years for cars, and 20 years for the overhead equipment, giving an average (having regard to the amount of expenditure shown above) of 25 years, the shorter period in respect of cars compensating somewhat for the excessively long period applicable to permanent way. Speaking generally, it cannot be said that the loan period is unduly extended in the case of electrical equipment of line. Experience goes to prove that the effective life thereof is in excess of this period. As to tramcars, I am reminded that in Leeds tramcars were purchased by us in 1897, and again in 1900. These cars are now undoubtedly due for replacement. It may be that the effective life-period of this asset has been over-reached, and I may say that replacements would certainly have been effected before this date but for the war and the very high prices ruling thereafter. Respecting permanent way, it is painfully common knowledge that 30 years in respect of all routes over some of which heavy services are run is excessive; 12 or 15 years in these days of much heavier vehicular traffic would be nearer the mark. But it is true that there must be quite a substantial portion of tramway tracks where a 25-years loan period would be quite suitable. 30 years, which is the period according to the usual practice, is therefore too long, if regard is to be paid only to the question of the life of the asset.

Tramway undertakings may, I think, quite legitimately contemplate the replacement of worn-out assets by charging such replacements to capital account, but I accompany this remark with a strong proviso that before fresh borrowings are indulged in for replacements, the old debt in respect of such assets should be entirely repaid. In my view no serious objection can be raised to this procedure, and I may say that in Leeds we are replacing 200 tramcars on this basis. If this method should be applied to sections of permanent way, I think that, as a measure of prudence, it would be advisable to fix the loan period at somewhat less than the present practice of 30 years, in some cases, say, 20 years or even 15 years.

With regard to depreciation funds in addition to sinking funds, I understand that they are statutory in some, if not all, Scottish undertakings. Edinburgh applies to that purpose a sum representing 1½d. per car mile run during the year, while Glasgow adopts a percentage basis varying according to the assets. Last year the total sum represented 3.8d. per car mile, or £490,000, whilst only slightly over £150,000 was actually spent on renewals. Had the undertaking based the provision on, say, 2½d. per car mile (Manchester and Bolton) then the result would have been a surplus instead of a deficit.

I have pointed out that 22 authorities contributed from tramways last year, in reduction of local rates, nearly £270,000. Both the policy and principle involved in that course can be reasonably defended; it cannot be controverted that the rider should pay the cost of the means of transport, whilst the ratepayers in general, who in case of a loss are called upon to meet the deficit, are entitled to some compensation in respect of the risk of that happening. How exceedingly narrow is the financial margin on which tramways carry on the essential services which they render to the community, will be realised when it is remembered that the loss of one passenger per car mile run represents over £1,903,000, or considerably more than the amount set aside in the reserve and renewals fund last year. In these circumstances no one will deny that the risk of loss is a constant and a real one, or question the equity of the contributions when a genuine surplus is realised. I have also pointed out that 34 tramway authorities received assistance from the rates by a direct transfer last year to the extent of over £425,000.

What are the counter-considerations? The amount paid in rates on the permanent way alone last year exceeded £600,000. Without this sum the local rates of the authorities concerned would have been increased by an average of 2d. in the £. The cost of the upkeep of the permanent way—much of which is now ordinary road maintenance—was last year £1,905,000, to which must be added the interest on and the redemption of the cost of constructing it, amounting to about £1,123,000. Electricity for traction purposes cost last year over £2,691,000. The price per unit varied considerably, but from a return which was issued by the Association in October last, it is obvious that the great bulk of it was purchased at a price substantially in excess of the actual cost. It is, in fact, a complaint that in this respect some tramway undertakings subsidise electricity undertakings. The free-riding facilities provided for some deserving members of the community represent a considerable loss of income in many cases. Taken in the aggregate, the tramway industry will compare favourably from the financial point of view with many other industries in the country.

I now pass to another matter, namely, the keeping and publication of the accounts. In this connection it has ever been the aim of the tramway department, over which it is my pleasure to preside, to endeavour to produce and publish the annual accounts at the earliest possible moment, and my committee has had the advantage of being able to consider the annual statements of income and expenditure at the first monthly committee meeting succeeding the expiry of the financial year. This promptitude is highly desirable, in view of the fact that the value of any financial statement dealing with large expenditures is proportionate to the punctuality with which it is available in relation to the financial period treated. It has come within my observation that at a recent conference of a kindred body to ourselves, a member of that body felt himself able to go so far as to make these remarks:—

"It was essential to proper financial control that a local authority should have unity of financial administration. It was therefore necessary that there should be set up by each local authority a finance committee to take charge of and control the whole of the finances and accounts of the local authority. To be consistent with the principle of unity of control, it was also necessary that the chief financial officer should be responsible for, and have charge of, the whole of the finances, and that the accounts should be kept in his office." "There was a tendency for some departments, especially trading departments, to become self-contained and independent of the treasurer's department, which made it difficult for the treasurer to carry out his legitimate duties." "This was wrong in principle, because, as everyone knew, there was a strong temptation to committees and officials interested in any particular undertaking to show satisfactory financial results by methods which an experienced and impartial financial officer would not approve."

It cannot be, surely, that the speaker had in mind, when making these sweeping statements, the large tramway undertakings of the country, and yet these are just the municipal departments where an approximation to self-containment is reached. As the servant of the finance committee the city treasurer must, quite properly, carry out the duties of his office. Nevertheless, the arrangement which has obtained since the inception of the Leeds tramway undertaking has, in practice, been quite satisfactory, whereby the city treasurer and controller deals with all matters of loans, reserves, income tax and departmental audit, &c., whilst the books are kept, and other financial and statistical work carried out, in the accountant's section of the tramway department.

It is evident that the views referred to are not unanimously held by Local Government Officers—as the expressions show which recently fell from Dr. I. G. Gibbon, Assistant Secretary to the Ministry of Health, at the conference referred to. He said:—

"One school tends to regard all matters relating to accounts as a holy of holies within which it is almost impious for

any but the treasurer and his staff to tread. I am inclined to view this as a dangerous doctrine. The best results will never be obtained by a system of checks, however efficient. The mind, not the machine, in the long run is important. The best road to economy does not lie simply in a system of financial control. It is to be found by placing a full measure of responsibility, for economy no less than efficiency, on the head of each particular service."

In my view, the presence of an efficient and experienced accounting officer and staff in the tramway department, at all times assisting the head of that department in regard to financial matters—standing, as it were, at his right hand, following his various operations day by day, and preparing the necessary statistical and financial statements—is essential to the successful working of any large tramway in these days when keen competition (which may alter in incidence almost from day to day) has to be met; and the responsible officer should possess the means of learning, with the least possible delay, what are the results of such alteration in arrangements for handling traffic as he may think it necessary to make. Any change that might be made that would have the effect of transferring from his department the duties of recording and preparing such returns would necessarily make it more difficult for the responsible officer to secure such information as is essential to him in the daily conduct of the undertaking. Such changes might prove uneconomical, and would undoubtedly in the long run result in the duplication of work and staffs.

Discussion.

Alderman W. C. Fenton (deputy chairman, Sheffield Tramways Committee) said it was not generally known by the ordinary man in the street that municipal tramway undertakings had to bear so large a share of the cost of street improvements and street maintenance, as was the case. The reduction of fares because there was a small surplus was the wrong policy if the undertaking was to be kept in a sound financial position. Where the position warranted it, he felt that the ratepayers were entitled to some consideration, for it was upon their credit that the capital for the municipal undertakings was raised. At the same time, the undertaking should not be starved in order to make profits for the relief of rates.

Councillor G. Burke (vice-chairman, Blackburn Tramways Committee) suggested that there should be more strict regulations compelling local authorities to keep their accounts in a commercial way, *i.e.*, providing a trading account as well as a balance sheet. Further, greater attention should be paid to the upkeep and maintenance of the permanent way and rolling stock. In Blackburn this policy had been pursued and the manager there claimed that the undertaking in that respect was as good as, or better than, when it was first installed.

Councillor A. Digby Willoughby (chairman of the Hull Tramways Committee) said it was possible to obtain assistance from the St. David's Committee for the purpose of track renewals on tramways, on those undertakings which were in a poor financial condition. Further, he believed that if the Minister of Transport was approached with regard to some of the difficulties confronting tramway undertakings financially he might allow from the Road Board Fund a fair amount of money towards helping in this direction. Hull had been helped very materially during the past few months from the Road Board Fund.

Councillor V. L. McEntee (chairman, Walthamstow Tramways Committee) complained that municipalities were not able to borrow money at the same cheap rates as private enterprise could. When a tramway authority desired to borrow money it was exploited by the financial people. Recently, Walthamstow had had to pay 5¾ per cent. in borrowing £300,000, and he suggested that the executive council should go into that matter very carefully.

Mr. H. P. Stokes (manager, Plymouth Corporation Tramways) claimed that municipal tramway accounts were kept in the most simple form that could be imagined, and that there was certainly no public company operating transport which would dream of giving the same detail as was to be found in municipal tramway accounts. The paper did not deal very fully with capital expenditure. Many undertakings to-day were suffering from a heavy capital expenditure due to having bought out companies. Profits should be put into the undertaking in the same way that a company puts surplus profits into its undertaking. In that way they could avoid further borrowing. One saw at the present time corporations raising money to renew track at a high rate of interest and at the same time allocating sums from tramway profits to the relief of rates.

Alderman Sir Peter Peacock (chairman, Warrington Tramways Committee) said that Warrington to-day had no difficulty in borrowing at 4½ per cent. On a certain road running through Warrington to Liverpool and Manchester the cost of renewal of the tramway track was very great owing to the heavy through traffic, and although representations had been made to the Ministry of Transport, the Corporation could get no help, and it was told that the tramways were trading undertakings.

Councillor Major Fitzgerald Jones (deputy chairman, Salford Tramways Committee), referring to the question of overlapping loans, said that in Salford there were over-lapping loans and he failed to see how they could be avoided as it was impossible to isolate one portion of the undertaking from another for the purpose of loans. As regarded the relief of rates by means of tramway profits, many people, and he was one of them, were of the opinion that there was no reason why the present generation should subsidise posterity by being charged high fares in order to allow the next generation to have tramway undertakings free of debt. There might be circumstances in which contributions could be made to relieve the rates out of the tramway profits without injuring the riding public.

Bailie P. Burt (sub-convener, Glasgow Corporation Tramways) contended that it was wrong for one municipal department to subsidise another in any way, and added that unless municipalities could carry on an undertaking better than it could be done by private people, then private interests ought to be allowed to do it. The position in Glasgow was that the Corporation could not call upon the ratepayers to make up any loss on the tramways, but there was a fund called the Common Good, which belonged to the citizens and not to the ratepayers, and it was from that fund that the money was obtained for establishing the tramway system. One useful manner in which a surplus could be spent was to lay down tram lines in outlying districts which, although at present they might not provide sufficient revenue to show a profit, would eventually develop into a paying concern.

Alderman Smithson, replying to the discussion, said that although in Leeds a profit on the tramways was usually budgeted for in advance to be applied to the relief of rates at the end of the year, this did not prevent the tramway committee developing the undertaking to the full. This year, for instance, although a profit of £50,000 was estimated for at the beginning the tramway committee had reduced fares to an extent which would reduce the revenue by £40,000, and it might be that the Leeds "chancellor of the exchequer" would not get his £50,000 at the end of the year.

Electricity Supply at Salford.

Agecroft Station Inauguration.

The Salford Corporation's new Agecroft power station, a description of which is concluded on pages 527-28 of this issue, was opened with great ceremony and pride, by the Mayor of Salford, on September 23rd, in the presence of about 400 guests, including the electrical engineers and Mayors of nearly all the neighbouring Lancashire towns. An Electricity Week was also held, the chief feature of which was an exhibition in the Pendleton Town Hall. The Electricity Committee feels that as it now has the resources for meeting a large demand, every effort should be made to create the desire for electricity in the home. Twelve manufacturers participated in the exhibition, which was comprehensive in its appeal, so far as domestic devices were concerned. The Salford Electricity Committee has acquired premises for the opening of permanent electricity showrooms.

On the morning of the opening of the new power station, the guests were given the opportunity of making a tour of inspection. The Mayor, Alderman G. Billington, J.P., who is also chairman of the Electricity Committee, switched on a new 12,500-kW set, two others being already in commission. Subsequently luncheon was served at the Midland Hotel, Manchester.

Sir P. A. Nash, in proposing the toast of "The Electricity Undertaking," congratulated the Corporation on the manner in which it had set out to meet the great demand for electricity, indicating directions in which electric power would most usefully serve the needs of the community, and emphasised the scope for industrial electrification. On behalf of the contractors, Sir Philip asked the Mayor of Salford to accept a handsome piece of plate.

The Mayor of Salford, in acknowledging the toast and the presentation, said that the site of the new Agecroft station was bought originally for a refuse tip. When the present scheme was first put before the Council, it was turned down; eventually costs became more moderate, and the Council decided upon a progressive course. The Corporation was now in a position to assist all large manufacturers to bring down prices by offering them a cheap supply of power, and the Electricity Committee was not out for profits; it was not out to relieve the rates so much as to give the best service possible to the community.

Toasting the trade and commerce of Salford, Lord Colwyn, P.C., D.L., remarked that at one time Lancashire could produce goods cheaper than any other country in the world, but he was afraid that it would not be in that position again until there was a fuller manifestation of co-operative spirit amongst all sections of the community. He urged the young men of to-day to leave sport and recreation and to concentrate their minds on helping their country.

Lord Colwyn provoked a scene when he attacked Communist Sunday schools. A Councillor, apparently of Socialistic sympathies, took exception to some of Lord Colwyn's remarks and the dissension became marked; the Mayor of Salford appealed to the two or three recalcitrants to maintain order and Lord Colwyn desisted from speaking on the matter further, though apparently against the wishes of almost the entire company. When he sat down, he was given a remarkable ovation.

Mr. W. C. Bacon, J.P., chairman of the Manchester Ship Canal Co., said that his company was one of the largest consumers of electricity in the borough, and when developments now taking place had been completed, its load would easily be the heaviest. He was satisfied that electricity would eventually supersede the present wasteful use of coal.

Lieut.-Commander F. W. Astbury, in proposing "The Contractors," said he was delighted to observe that all the machinery in the station was British made and congratulated the Electricity Committee on this fact.

Sir J. Kemnal replied and Alderman J. P. McDougall, J.P., Deputy Mayor of Salford, toasted "The Engineer." Electricity was introduced in Salford 30 years ago, and he had been on the committee 23 years. Agecroft was their third station; in his time there had been five engineers and he was happy to observe that three out of the five were with them that day; the electricity undertaking had given £154,000 towards the relief of rates.

Mr. J. A. Robertson said that the Agecroft station was the result of much co-ordinating work in which many people were concerned, to all of whom he wished to pay tribute. In 191[illegible] the borough was short of power, and the expedient was adopted of forging a copper link with their near neighbour. He hoped that this broadening of the views of the respective councils would be developed to a greater extent. In proceeding with the scheme the Salford Corporation had taken the long view. To-day the station had a load which would be remunerative even if it did not increase.

Mr. S. J. Watson, electrical engineer to the Salford Corporation, emphasised the policy of *service*, and said he hoped that in the near future there would be a great development in the domestic demand.

The final toast to the Mayor and Mayoress of Salford was enthusiastically honoured.

The Magnetic and Electrical Properties of Cast Iron.

By J. H. PARTRIDGE, B.Sc. (Hons.).

Abstract of a Paper read before the Iron and Steel Institute.

The paper is a record of the observations made from a series of experiments on specimens of cast iron, with elements of known and varying degree introduced to find the magnetic and electrical effects produced by them. Cast iron has the advantage of cheap production, convenient casting and machining properties, higher specific electrical resistance, and consequently lower eddy current losses. Hence the use of cast iron could be greatly extended if its magnetic properties could be improved. In 1902 Reusch, from a preliminary investigation, concluded that the carbon content plays an important part in the magnetic value of a material, whilst silicon plays a part chiefly inasmuch as it precipitates graphite, which latter hinders the magnetic induction; manganese did not seem to influence the magnetic induction unfavourably.

In 1921 Goltze concluded that silicon, carbon, manganese, phosphorus, and sulphur decrease the permeability of cast iron and should be kept as low as possible.

In the experiments made with the various constituents the iron was melted in a 30-lb. salamander crucible, and the elements were added either in the metallic form or as ferro-alloys, and bars 12 in. by 1 in. were cast in sand-moulds. The bars were machined down to 1.125 cm. diameter. The primary magnetisation curves were determined by using an Iliovici permeameter, and the hysteresis loops by the bar-and-yoke method. In order to determine the effect of silicon on the magnetic properties of cast iron, bars containing various per-

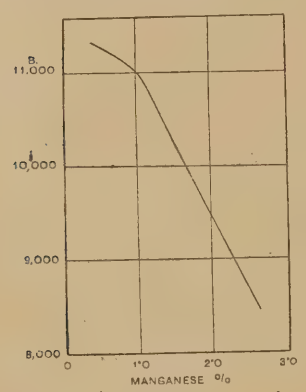

Fig. 1.

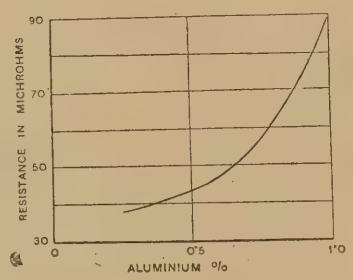

Fig. 2.

centages of this element were cast. Annealed and unannealed specimens were used and the most prominent feature was the magnetic superiority of the annealed bars. The magnetic properties of the cast specimens appear to deteriorate the higher the content of silicon. However, silicon does have a beneficial effect in the cast condition. Thus the magnetic induction of the annealed specimens increases with increasing silicon content. The magnetic properties of the samples were determined by taking hysteresis loops. In investigating the effect of manganese on the magnetic properties of cast iron, the manganese was varied whilst the silicon was kept constant.

Manganese is prejudiced to good magnetic properties and should be as low as possible when cast iron having high induction and high permeability is required. Fig. 1 shows the deterioration of magnetic induction with increase of manganese content. Annealing raises the magnetic induction. In the annealed condition, as in the cast condition, manganese increases the hysteresis loss and the coercive force, but decreases the magnetic induction and remanent magnetism. Since manganese tends to decrease the remanent magnetism, it may be concluded that the addition of this element to cast iron will not produce a material suitable for permanent magnets.

Aluminium was added to American washed iron. The magnetisation and permeability curves are given in fig. 3; specimens A1, A2 and A3 were annealed at 900 deg. C. for 15 minutes. There is a steady decrease in the maximum induction as the aluminium content is increased. The remanent magnetism also decreases as the percentage of aluminium increases. The effect of annealing is very pronounced. The curves of magnetisation and permeability for specimens A5 and A6 in the annealed condition are shown in fig. 3. The extreme high induction of these specimens is largely due to the small amount of combined carbon, and to the distribution of the graphite. Thus aluminium, up to 1 per cent., apparently increases both the coercive force and the hysteresis loss, but further addition causes a huge decrease. The coercive force and hysteresis loss of specimens A5 and A6 are very little greater than those of wrought iron. In order to investigate in detail the effect of aluminium on the magnetic properties of cast iron, it was decided to prepare alloys containing from 1 to 7 per cent., and from 18 to 24 per cent. of this element *i.e.*, to prepare only those alloys which can be machined. Aluminium decreases the maximum induction, the maximum permeability, and the remanent magnetism.

Chromium in the form of 62 per cent. ferro-chrome was added to American washed iron, to which sufficient 45 per cent

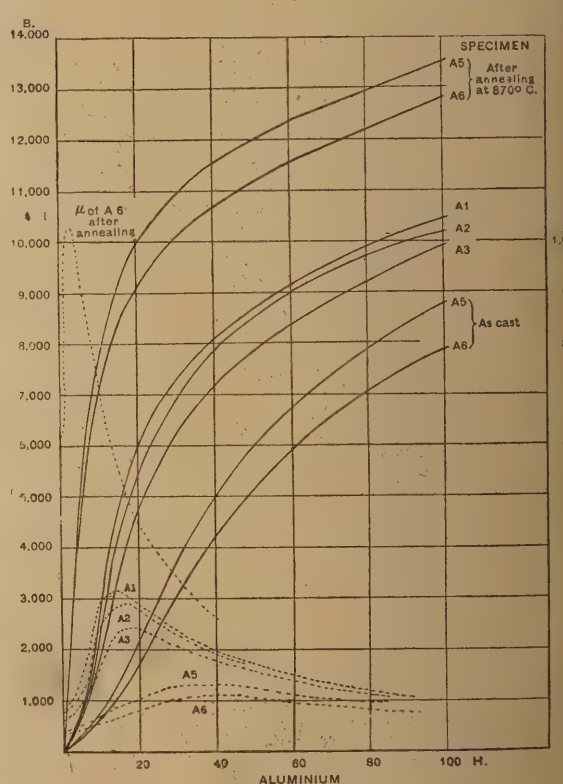

Fig. 3.

ferro-silicon had been added to raise the silicon content to 1 per cent. The specimens had to be prepared in two heat The three bars containing the larger amounts of chromium we satisfactory, but the specimens containing the smaller amoun of this element were high in silicon. Thus chromium is pr judicial to good magnetic properties. Its addition decreas the maximum permeability and the remanent magnetism, a increases the force at which this maximum permeability occur Thus chromium appears to decrease the remanent magnetis and to increase the coercive force and hysteresis loss. A parently chromium is capable of giving a sufficiently hi coercive force, but only at the expense of the remanent ma netism, which would be reduced to a very small amount.

In order to determine the effect of phosphorus, silicon a phosphorus were added to American washed iron. The effe of phosphorus is not very great, and it probably tends to i crease the induction.

In another case cobalt, in the form of metallic cubes, w added to American washed iron in order to determine the effe of this element on the magnetic properties of cast iron. Fro the results of a preliminary experiment, it appeared that coba

would make the iron sound and precipitate sufficient graphite to render the iron machinable. However, this was not the case, and so the bars were remelted and silicon was added. Cobalt increases the magnetic induction, remanent magnetism, and the maximum permeability.

Microscopical examination of the specimens was carried out, and from this it would appear that the magnetic properties depend to a great extent on the microstructure. It was found that for the highest magnetic induction and permeability, the graphite should exist as temper carbon, and as much ferrite as possible must be present. Graphite in the form of flakes is not favourable to high induction. The presence of free carbide denotes low magnetic induction, and should be avoided at all costs when high permeability is required. The presence of carbide also indicates high coercive force, high hysteresis loss, and low remanent magnetism.

The specific resistance of the specimens was measured by passing a small current and measuring the potential drop between two points on the specimen. In order to get accurate results the current was reversed and the specific resistance determined for at least two different current strengths. It was found that silicon increases the specific resistance, and annealing reduces it. In the annealed specimens, the graphite exists in the form of temper carbon, and the continuity of the current is not affected to the same extent.

The effect of aluminium is to raise the specific resistance of cast iron. Annealing raises the resistance, due to the deposition of graphite, as is evident from the fact that the resistance of specimen A5 is less than that of specimen A3, whilst A6 has only slightly higher resistance than A3, although the specimens A5 and A6 contain more aluminium than A3. The increase in resistance due to aluminium is shown graphically in fig. 2. Phosphorus apparently increases the specific resistance.

From his observations made during the series of experiments described, the author has drawn the following conclusions, briefly stated :—

The highest magnetic induction and permeability are obtained with cast iron which has been annealed. When high permeability is required, the graphite should be in the form of temper carbon; as little combined carbon as possible should be present, and free cementite must be absent. In the cast state, silicon decreases the magnetic induction, but its presence may be advantageous in alloys which have to work at low flux densities (*e.g.*, transformer cores). Both in the cast and annealed conditions silicon reduces the coercive force and the hysteresis loss.

In both conditions manganese, nickel and chromium are prejudicial to high magnetic induction. In the annealed condition manganese and chromium increase the coercive force and hysteresis loss and decrease the remanent magnetism. In the cast state aluminium decreases the magnetic induction, permeability and remanent magnetism, and increases the coercive force and the hysteresis loss. In the annealed condition aluminium, in amounts up to 1 per cent., decreases the magnetic induction and the maximum permeability, but increases the coercive force and hysteresis loss.

Phosphorus has little effect on the magnetic properties of cast iron, probably tending to increase the magnetic induction in alloys containing silicon.

The presence of sufficient nickel, or nickel and manganese, makes cast iron non-magnetic.

In the cast state cobalt increases the magnetic induction and remanent magnetism, and increases the maximum permeability.

Both manganese and chromium are capable of giving a sufficiently high coercive force for a good permanent magnet, but in doing so they reduce the remanent magnetism to a very small amount.

Silicon, manganese, and aluminium raise the specific resistance of cast iron.

Cast iron has a very high specific resistance, and is suitable for resistance grids which have to pass heavy currents.

The Wireless Exhibition, 1925.

An All-British Display of Radio-Telephone Apparatus and Accessories.

(*Concluded from page* 514.)

General Electric Co., Ltd.

This company had a very comprehensive display of its radio-telephone products. Prominent among these were examples of super-heterodyne sets—one with six and another with eight valves—designed for a wavelength range of from 200 to 3,000 metres. The six-valve model was arranged with a glass panel to show the construction and movements of the set. Four-valve "Gecophone" cabinet and table sets were exhibited, as well as the new "Gecophone Junior" crystal set. Most of these sets were fitted with the company's new low-loss slow-motion variable condenser (fig. 21). This has an all-metal frame to which the rotary plates are connected. The vanes are of brass and of the "square-law" pattern. The fixed plates are insulated from the frame outside the electrostatic field. The spindle, which is operated by the knob, has a large disk at its end which engages by friction with the small diameter of a "two-speed" idler. The larger diameter

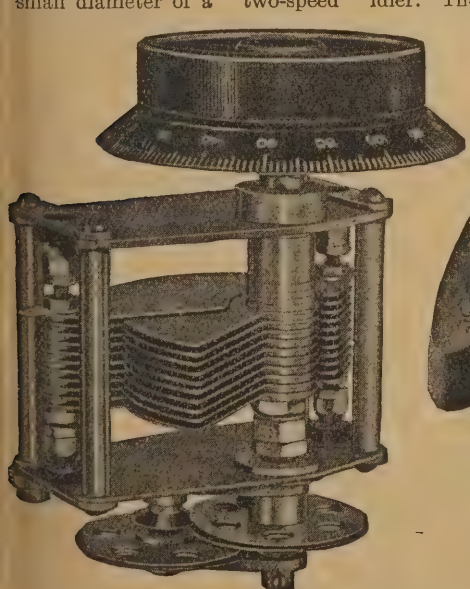

Fig. 21.—The New G.E.C. Low-loss Slow-motion Condenser.

Fig. 22.—Sterling "Mellovox" Loud-speaker.

of the latter engages again with the spindle of the moving vanes, and by this means a considerable speed reduction is obtained. It is claimed that the minimum capacity of this type of condenser is 1/50th of the maximum capacity. The coil holders shown include one for mounting behind the panel, the relative positions of the coils being indicated upon a dial at the front of the panel. Other components shown were a buzzer-type wavemeter; aerial-earth switches; anode reactance units, &c. A section of the exhibit was devoted to "Osram" valves.

Sterling Telephone & Electric Co., Ltd.

A range of standard receivers and amplifiers was on view with headphones and components. The loud-speakers included the "Mellovox," fig. 22, a new hornless model obtainable in three-colour combinations; the "Audivox II" is fitted with an adjusting device, and is claimed to be especially suitable for use out of doors. The Sterling "Super Invicta" battery is as simple as the Leclanché cell as regards ease in handling. Its dimensions are $9\frac{1}{2}\times7\frac{7}{8}\times6\frac{1}{2}$ in., and no chemical depolariser is used, air being relied upon for this purpose. The initial voltage is 1.4 and the e.m.f., after the initial drop, remains practically constant during the discharge on a given external resistance, provided the size of cell is adapted to the ohmic value of this resistance. A large zinc surface is used for the positive and a special carbon for the negative elements; the special construction of the carbon blocks enables them to remain dry in spite of their immersion in the salammoniac electrolyte, so that the gases generated can mix freely, inside the blocks, with the oxygen in the air. The largest cell of this type has an approximate capacity of 500 ampere-hours when discharged at the rate of one ampere for eight hours daily.

S. Smith & Sons (M.A.), Ltd.

This firm's exhibit consisted of transformers, "Mouldensite" insulating material, small h.p. generators for driving motors, &c., and a new unit in the form of a resistance-capacity auto-transformer. The M.L. anode converter is a machine driven by an ordinary accumulator which is intended to take the place of high-pressure batteries for receiving and low-power transmitting sets. The various types of machine include those delivering two separate voltages for the detecting and amplifying parts of the set, and a special model for three or more resistance-capacity coupled amplifiers.

Autoveyors, Ltd.

In addition to condensers and such specialities as "Clix" and radio conduit, the company showed for the first time the high-frequency relay recently referred to in our pages. The adapted model exhibited, whilst retaining most of the principal features of the original design (as employed in the compound focus apparatus) has, in order to avoid too revolutionary a departure from existing subsidiary components and accessories, been confined in principle and design to conform to "valve" convenience, employment, and fitment. It is claimed to provide a means of adaptation of the h.f. relay as a form of "valve" to existing apparatus, and is said to employ electromagnetic phenomena.

S. G. Brown, Ltd.

The various loud-speakers shown by this company included a new cabinet of mahogany without a horn. The tuned-reed principle has not been departed from and a feature is the placing of a quartered moulded board in a central position immediately in the mouth of the flair, which enhances the instrument's appearance. A modified cheaper type of the original tuned-reed "A" headphone was noticed, besides gramophone adaptors, transformers, crystal sets, instruments for the deaf, and electro-megaphones.

Marconiphone Co., Ltd.

Besides valves, including transmitters, amongst the receiving instruments shown were reflex circuits and a new series of two-, three-, and four-valve sets of simplified tuning and construction for loud-speaker work. A large "straight eight" set, as shown in fig. 23, was noticed which employed five stages of h.f. amplification, followed by a detector and two l.f. stages. Reaction has been avoided entirely, which necessitated increasing the number of valves; nevertheless, the filament consumption is only 0.68 A at 6 V, or approximately the same as that of one "R" valve, while the h.p. consumption is said to be no larger than that of four-valve instruments. The dimensions of the cabinet are approximately 26 by 16 by 13½ in. As regards components, the "Junior Ideal" transformer is new, and so is the "die cast" condenser of the square-law type. "Public address" equipment was demonstrated in the main hall, including the Round-Sykes magnetophone, and the valves shown included the D.E.6 (fig. 24), which is particularly suitable for the last stage of a l.f. amplifier using D.E.R. or D.E.2 valves in the initial stages. Its anode voltage is from 60 to 120 V, with from 5- to 10-V negative grid bias; the filament voltage may be from 1.8 to 2 V, and the filament current 0.5 A. The impedance is 10,000 ohms and the amplification factor 5.5.

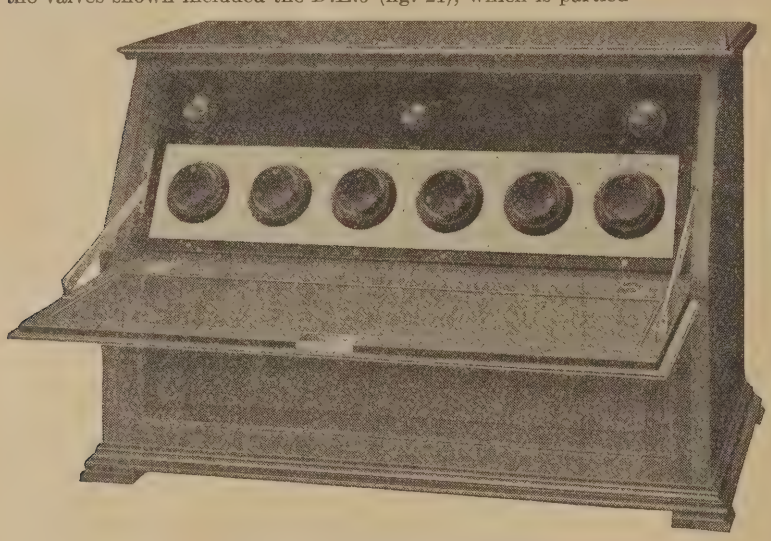

Fig. 23.—A Marconiphone 8-Valve Set.

Fig. 24.—The Marconi D.E.6 Valve.

Fig. 25.—A McMichael Supersonic Transformer.

Chloride Electrical Storage Co., Ltd.

Amongst the various batteries and component parts shown by this company, PW cells for ships' wireless were noted, and the new high-pressure accumulator illustrated in fig. 26. The special features of the latter are: It needs to be recharged only once every six months when used for radio or similar purposes; it is supplied in a dry-charged condition and can be put into operation immediately after being filled with acid, but a freshening charge is desirable during the first month of use. The container is of moulded glass and no separators are required, while no brass or other corrodible material is employed. Every plate is visible, the acid level is plainly marked, and suitable connecting clips are provided with each battery for tapping in 12-volt steps. The battery is made up in 12-cell units, giving 24 volts per battery, the actual capacity of which is 5,000 milliampere-hours when used for very small discharge currents, such as are required for radio apparatus. The normal charging current is ¼ ampere and the weight of the battery is 15½ lb., its width being 4⅜ in., height over the lead terminals 5¼ in., and length 8⅝ in.

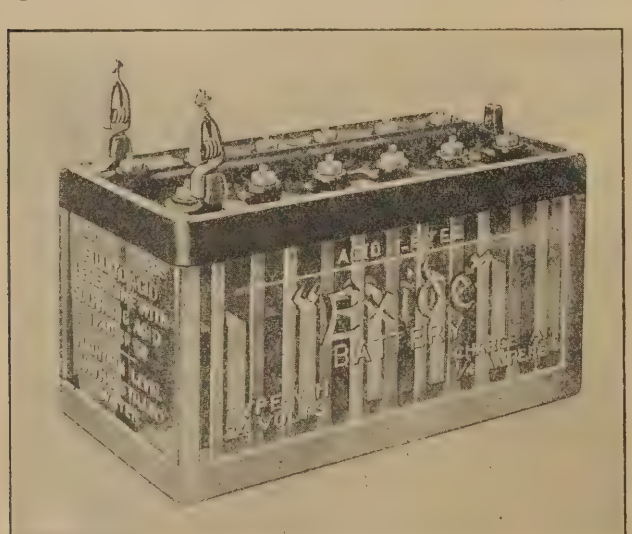

Fig. 26.—The Chloride h.p. Radio Battery.

L. McMichael, Ltd.

Complete receiving sets and many well-known accessories were shown. The firm's super-heterodyne tuned intermediate transformers, although by no means the first to appear, are original in design; the component is provided with a specially-constructed iron core, and a variable condenser to tune the primary is embodied in the top portion of the component, while a milled ebonite knob with a pointer rotating over an engraved scale enables accurate tuning within close limits. The transformer is illustrated in fig. 25. The company's reactor may be used to best advantage as the oscillator unit of a supersonic circuit when plugged in to either its special autodyne neutral point transformer when an autodyne circuit is being used, or into the No. 0 ordinary h.f. transformer when the heterodyne method is being employed.

The M.H. condenser test panel consists of an ebonite base with two terminals, to which are connected four pairs of condenser clips. It will be readily appreciated that by a combination of four clip-in condensers a wide variation of capacities can be instantly obtained by the simple expedient of clipping-in or unclipping the condensers. For obtaining the correct capacity across loud-speaker terminals, for instance, this component is obviously of value. The "Reversine" coil holder will have many uses, for it enables the moving coil to be reversed both in its physical and electrical relationships to the fixed coil. The triple rheostat provides for the control of up to four valves and allows extra valves to be added without disturbing the original lay-out of the panel.

M.O. Valve Co., Ltd.

This company had on view a selection of Marconi and Osram broadcast receiving valves, including 4-electrode bright and dull emitters, high-power commercial valves, and cooled anode 20-kW models. The D.E.T.1 type dull-emitter low-power transmitter is capable of dissipating up to 40 watts at the anode, with an anode voltage of 1,000 V, the filament current being 1.9 A at from 5 to 6 volts.

Radio Communication Co., Ltd.

The "Twin" is an extremely compact receiver, while the "Polar Four" incorporates two distinct tuning circuits, each of which can be tuned to a separate station and the set can be switched to either, thus affording a constant choice of two programmes; it is also suitable for use in a wired house system, enabling control of volume and choice of station from different points in the house. The "block" method of set assembly was represented, and amongst the accessories a hornless sound-reproducing instrument was seen; the dual and triple condensers shown should be very useful for simultaneous tuning, the two or three similar air condensers, as the case may be, being mounted on one spindle, and in order to prevent any risk of the vanes short-circuiting, mica vanes are introduced to separate the metal plates; screening sections separate the individual condensers so as to prevent unwanted coupling between the various sections. The limits of capacity available with the triple condenser are from 0.000014 to 0.00078 microfarad, and the component permits the simultaneous tuning of two or three circuits in one operation, *i.e.*, tuned anodes.

This company staged a representative group of transmitting and receiving apparatus as used on ships of the British mercantile marine. The display included a reproduction of a passenger liner's wireless cabin, in which was fitted a "Polar"

1½-kW transmitting and receiving set, a 1½-kW continuous-wave valve transmitter, and emergency transmitting and receiving apparatus with the necessary manipulating equipment; in addition there was shown a complete ½-kW spark transmitting and receiving set as generally used on an intermediate-type ship, and a ¼-kW spark transmitting and receiving set as usually fitted on board a cargo vessel. A lifeboat transmitting and receiving set was on view and a model of an automatic call device, designed to keep watch on board ship during the absence of the operator and to give an alarm in the event of a distress signal being received.

Burndept Wireless, Ltd.

A full range of this company's well-known apparatus was exhibited, including the new "Ethodyne" seven-valve super-heterodyne receiver, the chief features claimed for it being selectivity and extent of range. Two frame aerials, for plugging into the top of the cabinet, are supplied with the set: one for 250 to 500 metres and the other for 1,000 to 2,000 metres, with a change-over switch. All the tuning is done by the two centre knobs (fig. 27) and the seven valves are of four different types, to ensure that each is correct for the work it has to do. A switch enables one or both power valves to be used; volume control allows the set to be used two or three miles from a station. Besides a series of components the firm supplies valves which are "guaranteed" and a "super-vernier" dial for the fine adjustment of condensers, reaction couplers, variometers, &c., which may be fitted to any set without dismantling it in any way. Concealed within the dial (fig. 28) is a novel friction-driven epicyclic gear and when the knob is rotated it causes the dial and condenser to turn in the ratio of 7 to 1; if rapid searching is required, the dial is rotated instead of the knob. An exhibit was staged in the gallery to illustrate the auto-broadcast system as installed in the Waterloo Hospital under the *Daily News* Wireless for Hospitals Fund. Lead-covered wiring is run throughout the building in a similar manner to lighting circuits and listening points are provided in all the wards. With the aid of the fund seven hospitals have already been equipped in this way and nineteen are in process of being equipped.

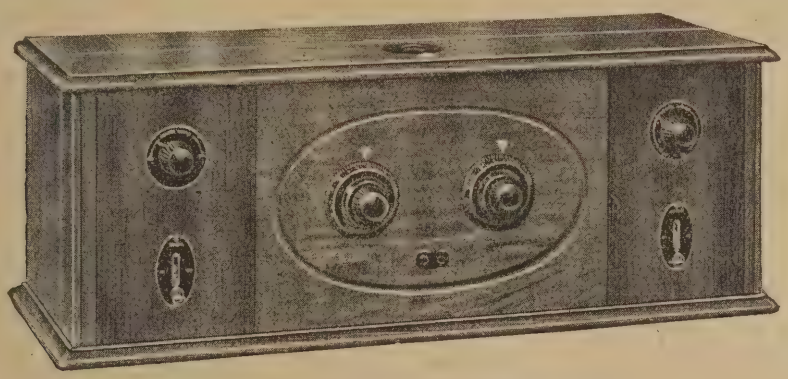

Fig. 27.—"Ethodyne" 7-valve Super-heterodyne Receiver.

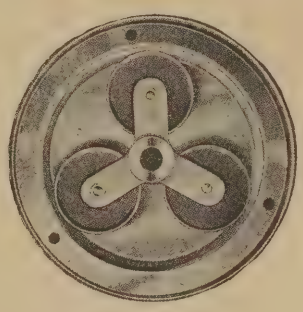

Fig. 28.—Base of Burndept Condenser Dial.

Gent & Co., Ltd.

Besides a variety of "Tangent" radio fitments, there were on view complete receivers, headphones, loud speakers, and a.c. rectifiers for high-pressure supply. The company also caters for constructors' requirements.

Sylvex, Ltd.

This company showed "Sylverex" natural galena crystals and "Kathoxyd" crystals, which are composed of a small brass cup that holds a metal plate covered with a chemical compound. Two special contacts are supplied, one being made of zinc-iron and the other of graphite.

Dubilier Condenser Co. (1925), Ltd.

Amongst typical types of condensers for broadcast receivers, transmitting stations, and laboratory use, the "Univane" pattern was of interest. It is a new type that provides the electrical equivalent of mechanical vernier gearing throughout the full range of the condenser, and this desirable result is accomplished by a simple arrangement by means of which the rotation of the knob of the condenser moves only one vane of the condenser at a time. As soon as one movable vane has been rotated into position where it interleaves with the fixed vanes, a second vane is picked up and is rotated into position as the knob is turned. Thus the full movement from minimum to maximum capacity requires several complete revolutions of the knob of the condenser which enables very fine tuning to be obtained. The number of times that the knob has been turned is shown on a small auxiliary indicator attached to the front of the instrument alongside the dial. The instrument is suitable for use in all types of radio receiving sets.

Other Exhibitors.

The following firms also exhibited sets and accessories:—Auto Sundries, Ltd.; F. E. Wootten, Ltd.; Bowyer-Lowe Co., Ltd.; British Ebonite Co., Ltd.; Neutron, Ltd. (synthetic crystals); J. J. Eastick & Sons; Eagle Engineering Co., Ltd.; Beard & Fitch, Ltd. ("Success" supersonic-heterodyne receivers and components); A. C. Cossor, Ltd.; Pell, Cahill and Co., Ltd.; Falk, Stadelmann & Co., Ltd.; Climax Radio Electric, Ltd.; British Radio Corporation, Ltd.; Hirst Bros. & Co., Ltd.; National Wireless & Electric Co.; Hart Accumulator Co., Ltd.; London & Provincial Radio Co., Ltd.; "Kenmac" Radio, Ltd.; H. Quartermaine (earthing device).

Marconi's Wireless Telegraph Co., Ltd., staged an interesting exhibit of historical apparatus, while the undermentioned firms exhibited sets and accessories manufactured by members of the N.A.R.M.A.T.:—Messrs. Cables & Electrical Supplies; A. W. Gamage, Ltd.; Brown Brothers, Ltd.; Selfridge & Co., Ltd.; H. J. Galleries; Hobday Bros., Ltd.; East London Rubber Co.; and A. J. Dew & Co.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Electrical Propeller for Water-Velocity Measurement.

A recent production of the Stonebridge Electrical Co., Ltd., Victoria Road, North Acton, W.3, takes the form of an apparatus for measuring the velocity of a water system, and is built on the principle of the electrical tachometer. It permits, it is claimed, the direct measurement of the momentary value of this velocity, without intermediate calculations. The device consists of a propeller, direct coupled to a very small generator mounted on a common spindle and enclosed in a metal case which is divided into three compartments. The front portion contains a pipe filled with oil, in which the bearings of the driving spindle are located. The rear compartment houses the generator, a small magneto machine of about 0.3 W max. load. In the middle compartment the spindle is decreased to 1 mm. diameter, with double bearing, in order to reduce the friction and render the compartment watertight. A suitable lubricant fills the space between the two middle bearings. In the case of water entering this, it can be easily removed by loosening a screw, the head of which acts as a support. The indicator comprises a small precision instrument which measures the voltage produced by the generator, transmitted by means of a watertight contact piece and a twin flexible cable. The voltage is proportional to the water velocity.

An Electrical Refrigerator.

The Delco-light Co., 717-723, Fulham Road, S.W.6, manufacturers of the Frigidaire electrical refrigerator, exhibited a film bearing the above title to a gathering of their dealers and others interested in refrigeration at Frascati's on September 9th. The film is very instructional. Commencing with specimens of primitive cooling systems, such as the "Water Caves" of our forefathers, the principles of which are fully demonstrated, it proceeds to the "ice-chest" period, in which stress is laid on the rising temperature and diminishing ice factors, together with the processes by which food is affected in the moist atmosphere of the ice-box. Finally we reach the "Frigidaire" electrical refrigerator, and in this section the full working processes of the plant are shown. The plant is automatic; it is fitted with a thermostatic device which starts and stops the compressing unit whenever the temperature of the cabinet necessitates it, so that there is no waste of current nor can the temperature ever rise above a certain point, which is several degrees colder than ice at its lowest temperature. It is claimed for the "Frigidaire" that it provides an absolutely dry germ-free atmosphere in which food is preserved for a much longer period and in more hygienic conditions than is possible in an ice-chest. It can be operated from any electricity supply at, it is claimed, trifling cost, and is

made in sizes to suit the small household or the requirements of those who want up to 400 cu. ft. of refrigerated space.

The accompanying illustration (fig. 1) is of a "Frigidaire" plant. The heat-absorbing element is sulphur dioxide in liquid form. This vaporises at temperatures above 8 deg. F. The compression brought about by the vaporisation operates the switch controlling a small electric motor driving the com-

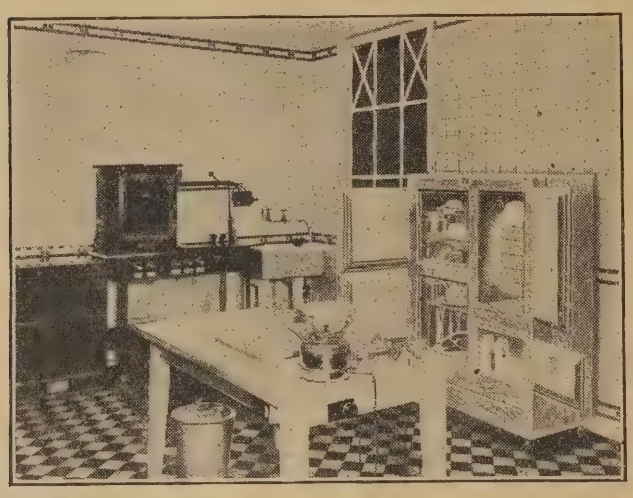

Fig. 1.—A "Frigidaire" Refrigerator.

pressor, at a temperature of 28 deg. F. The sulphur dioxide is compressed into a cooling coil, where it is cooled down till it is converted back into liquid form, when it is again circulated into the absorbing element container. In the latest design of the plant the cooling is effected by air circulated by a fan driven from the compressor motor. In the older designs the cooling was brought about by water circulation.

A Transformer Truck.

The increase in size of the plant in use by the larger electricity supply undertakings and the advantages arising from the rapid installation or changing-over of plant have made the provision of adequate handling facilities of importance. The Brush Electrical Engineering Co., Ltd., Falcon Works, Loughborough, has designed special trucks to suit the requirements, one of which is shown in fig. 2; this truck is designed for loads up to 25 tons, and is intended to facilitate the handling and movement generally of transformers and other plant of a similar nature. Arranged to run on main-line railways, it can be used in conjunction with standard railway locomotives and wagons, the usual spring buffers and centre draw hooks and chains being provided. The wheels are of cast steel, mounted on large-diameter axles, provided with ball bearings at the extreme ends. Side lever brakes are fitted,

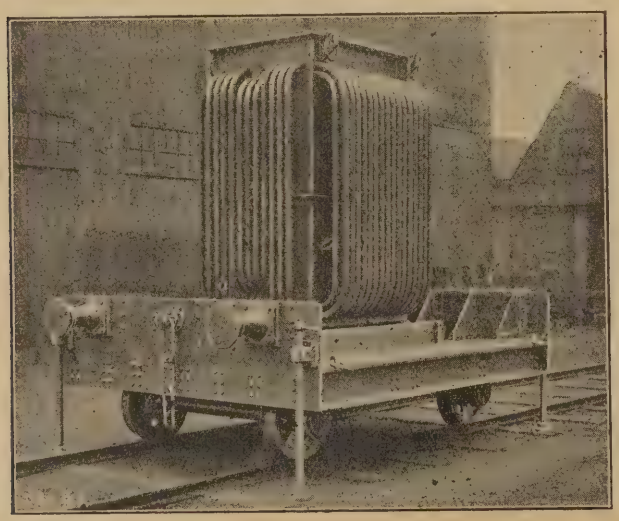

Fig. 2.—A Brush Transformer Truck.

and at each corner there is an adjustable screw column so that the truck may be secured in a level position when being loaded and unloaded, and the possibility of tilting during such an operation is avoided. The floor of the truck is provided with lines of holes to take adjustable stretcher bars of wood, so that the transformer can be firmly held in position during shunting operations. The truck should be of considerable advantage where transformers have to be moved into or out of sub-stations or other buildings, as it can be run into a siding or pit adjacent to the building, and by means of the rollers usually provided the transformer can be quickly run off the truck when the stretcher bar has been removed. The requirements of this class of rolling stock will, of course, vary with the individual requirements of different undertakings, and the makers have different types under construction to suit the particular conditions for which they are needed.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Charges for Electricity Supply.

I was much amused at "Stung's" letter in last week's Review (Sept. 18th), and I cannot let it pass without replying.

To begin with, gas can be stored very conveniently, electricity cannot. Gas should be sold at about 1s. 6d. per thousand and still show a profit—a lot of it is carburetted water, is a deadly poison, blackens ceilings, ruins leather upholstery, burns up the air, &c., *ad infinitum*.

Gas is sold at about three times its value to enable the gas department to change the street lamps every few years, trying to compete with electricity; to lend gas stoves and lead piping to anyone who will use it; to fit powerful lights outside shops at a very cheap rent; in fact, anything that will use gas can be had for next to nothing.

Gas shows such a good profit that they can afford to do it. I would suggest that "Stung," if he is still dissatisfied after reading this, goes back to it and gets value (according to his idea) for his money—the electricity department would not miss him!

Why, even the chairman of the gas department, who thinks (or at least, says) his gas is wonderful, uses electricity!

In rural districts, the people pay anything from 6d. to 10d. per unit for the privilege of having electricity, and I cannot believe the Eccles electricity department will put a service in, supply a meter and a man to read it if they cannot see a return of 30s. per annum paying for what is used at a flat rate.

According to "Stung's" idea, if a house is closed up for a year or two, no charge should be made for service. He wants vision and should think of it like this: A host of men are employed, countless thousands of pounds sterling have been paid out, to give him a supply of electricity, and if when he pressed his switch, no light came, he would have a just cause for complaint. It is up to him to use electricity freely for everything possible, so that his rateable value will be only a small proportion of his total bill. In my own case, frequently I used 2,000 units per quarter and my fixed charge was 30s. per quarter, so that my total inclusive cost per unit was less than ¾d.; at that price there is no room for argument about coal or gas and we cannot forget convenience, cleanliness, and all the other stock arguments.

About 150 small houses had electricity installed about sixteen years ago, the builder buying electricity in bulk and charging 1s. per week in the rent; no meters were installed, no heating or other devices were allowed, and it was found that at 3d. per unit, each house averaged 2s. 9d. per week the year round for lighting only.

As the builder was losing money on this, meters were put in and the average came down to 1s. 3d. per week. I therefore cannot see how "Stung" can have any grievance against the department's insisting on a minimum of £2 per annum, and if he will get busy and buy a few second-hand radiators and *use them*, giving up, "in view of his poverty" his preference for a coal fire, he will find that he gets most wonderful value. There will be less work in the house, he can put ferns in his grate, his wife (if he is married) will be all smiles, having less work to do, and everybody will be happy. He may leave the hall light on every evening, making the house look cheerful.

September 21st, 1925. **E. O. W.**

The Manufacture of Induction Motors.

With reference to Mr. Shaw's letter in your issue of last week, Mr. Shaw will appreciate that the information on which the estimate is based is of a confidential nature and therefore cannot be published.

In anticipation of any scepticism we submitted to you in confidence the basis of the estimate. If Mr. Shaw is seriously in doubt as to the accuracy of the statements contained in the advertisement to which he refers, we suggest that he make an appointment to meet the writer, when we have no doubt we shall be able to give him sufficient information to remove such

F. & A. Parkinson, Ltd.

Guiseley, *September 22nd*, 1925.

[Since the advertisement appeared we have received from Messrs. Parkinson certain figures in support of their claim, the accuracy of which we, of course, are not in a position to vouch for; doubtless they would be pleased to disclose them in confidence to Mr. Shaw. They are also publishing their own output figures for last July in our advertisement pages to-day. Is there any reason why they should not publish replies to Mr. Shaw's questions Nos. 2, 3, and 4?—Eds. Elec. Rev.]

Rural Electricity Supply.

Some very interesting information, in my opinion, is given in the "Correspondence" columns of your issue dated September 25th by Mr. W. Fennell, of the Mid-Cheshire E.S. Co., in particular his remarks on the use of single-phase current, which is only now beginning to be considered on the Continent, as hitherto they have adhered to a 3-phase supply for all power purposes (only utilising single-phase for small lighting loads). His figures of cost of tappings are a remarkable example of what energy and skilled enterprise can bring about, and should do much to take "the wind out of the sails" of those

who make their excuse for not supplying a rural area, that it would cost them over five times the amount of the expenditure to which the Mid-Cheshire E.S. Co. has to go to attain the same end.

As regards the difficulties of possible interference of power lines with telephone lines, there is a great deal in the old saw that "possession is nine points of the law." The telephone engineers were in the field first, and they have built up a fund of accumulated experience upon which it is easy for them to draw when they come in contact with an overhead electrical transmission engineer who, though he may be an expert on his own subject, is not so well versed in the subtleties of the law and custom. The telephone engineer, after all, is only human and he has enough troubles of his own, without adding to them the possible interference of high-pressure transmission lines; so it is obvious that he is not going to make things too easy for the transmission engineer. Again, a powerful government department is very different from a small electricity supply undertaking, and can therefore carry many points by its own weight. Personally, I have always got on very well with telephone engineers, but I have always found it most expedient to confer with them, at as early a stage as possible, in connection with any proposed new development. Still, as your correspondent indicates, it would be just as well if all the electricity supply undertakings could agree on a common basis.

Apart from telephone matters, a much freer hand will be necessary in the design of rural electrification networks. To attain this end there must be some method whereby existing regulations—intended really for entirely different conditions—need not be complied with; hence a solution to this very important question, as to how this can best be accomplished, is badly needed. Mr. Fennell has given some most useful indications as to what is required: now it is for others to add to his contribution.

R. Borlase Matthews.

East Grinstead, *September 25th*, 1925.

The Roman Baths at Bath.

The advertisement on page xxxiii of your issue of September 18th, referred to by Messrs. Johnson & Phillips in their letter in your current issue, was not inserted to flatter them or anyone else. It was inserted to remove a misleading impression—undoubtedly unintentional—that would be sure to be produced by their advertisement in your issue of August 7th (Supplement, p. 11) and to emphasise the principle of "Truth in Advertising."

W. T. Henley's Telegraph Works Co., Ltd.
(W. A. Moore, *Advertising Manager.*)

London, *September 25th*, 1925.

Current Literature.

As of necessity I have to (and like to) keep myself well informed, I have always used such digests as are available. Hence I appreciate your correspondent's suggestion. However, I also know the difficulties. I find it to be a very good plan, if one wants something of this sort and at the same time feels that it has a wide benefit, to start it. If you have compiled a really useful table and would like to have it neatly in print, get it published, and then you benefit others as well as yourself.

Some time ago the Electrical Review used to publish, fortnightly, a classified list of its own contents, which I, personally, and a number of my acquaintances, found very useful. Its only drawback was that it appeared a little late and lacked an international classification.

I started a weekly digest of all the more important current electrical articles in the columns of *Electrical Industries*, a number of years ago. This feature is still running, though the international classification has been dropped. I am at present attempting to deal with all published matter concerning the applications of electricity to agriculture in a monthly journal that I am editing, entitled *Electro-Farming*.

Science Abstracts covered the field very well, but its timing was too great for me. It also suffered from the lack of international classification.

A number of digests of current literature are prepared by various associations and companies in this country; in fact, there is a good deal of overlapping of work. The Association of Special Libraries and Information Bureaux (38, Bloomsbury Square, W.C.1) is doing a great deal to bring about co-operation between those who are digesting various classes of current literature. Your correspondent should get in touch with the secretary. The second annual conference of this Association has just been held.

My general view is that what is chiefly required is (*a*) the classification preferably on the International basis, (*b*) the author's name, (*c*) the mechanical particulars, *i.e.*, length of article and number of illustrations, (*d*) a brief note to give a clear indication of the contents, and (*e*) most important, prompt publication while the journals digested are still current. Rarely can an abstract be sufficient in itself, it should be rather a guide to the article as to whether or not it is worth looking up, since, for serious work, one must always read the original article.

There are over 24,000 scientific and technical periodicals, all of which at some time or other refer to electrical matters, so their abstracting is not an easy affair.

R. Borlase Matthews.

East Grinstead, *September 25th*, 1925.

A Disclaimer.

It has come to my knowledge that a rumour is in circulation that I have accepted the agency of a well-known firm of Austrian manufacturers. Although we all know that rumour was ever a "lying jade," to be severely ignored—in view of the fact that I continue to hold the office of chairman of the N.A.R.M.A.T. Special Committee for the Safeguarding of the Radio Industry, I feel it incumbent upon me in this instance to give rumour the lie direct by stating that I personally have had no business negotiations with any person or firm in Germany or Austria since the outbreak of war; further, I have not accepted the agency for, or taken a commercial interest in, any foreign firm.

I shall feel greatly obliged if you will be kind enough to publish this letter in your next issue.

Guy Burney.

London, *September 28th*, 1925.

Legal.

Telephone Contract Dispute.

In the Mayor's and City of London Court, before Judge Shewell Cooper, on September 22nd, the New System Private Telephone Co., Ltd., Arundel Street, W.C.2, sued Messrs. B. Maisel & Co., Moorgate, for £11 7s. 8d., rent of a telephone installation from January 1st, 1924, to June 30th, 1925. Defendants counter-claimed for damages for breach of contract and a declaration that they were not bound by the agreement of May 29th, 1919, whereby they undertook to rent an installation for 21 years. Alternatively they claimed rectification of the agreement so as to entitle them to give three months' notice to determine it. For the plaintiffs it was stated that the defendants signed the contract in May, 1919, hiring an installation with four instruments for 21 years. The rent had been paid until that now sued for and the defendants sought to say that the contract was void owing to the fact that the instruments had to be attended to from time to time. Documents were produced on behalf of the plaintiffs, which showed that the installation had been periodically examined, and signatures given on behalf of the defendants that all was in order. For the defence, evidence was given by Mr. T. G. Dobb, general manager of the defendant firm, that throughout the period in which the installation had been in use it had been a constant source of trouble. Lately it had been out of use altogether as it was so unreliable. Cross-examined, witness admitted that he signed a contract for 21 years, but said that when he did so he was under the impression that it was not for such a long period, but was subject to six months' notice on either side, and his firm had given such a notice, which, however, the plaintiffs had refused to accept. Witness admitted that from 1921 to 1923 no complaint was made with regard to the telephone in writing, and he also admitted that periods of many months occurred when, according to the records kept by the plaintiffs, everything appeared to be in order. Judge Shewell Cooper said there was only one construction to put upon the contract and that was that it was for a period of 21 years. With regard to the present claim he was satisfied that at times the apparatus had gone wrong and adjustment, and attention was necessary, which was only to be expected in an installation of that kind. It was admitted, with the exception of one occasion when a delay of six weeks was experienced, that the plaintiffs had always attended and overhauled the apparatus when requested to by the defendants. For that six weeks' delay plaintiffs had made a generous allowance. In his view the plaintiffs' claim succeeded, and he gave judgment for them on the claim and counter-claim, with costs.

Radio Goods Conspiracy.

After a trial lasting five days, the hearing was concluded at the Central Criminal Court, on September 23rd, of the case against Naum Abram Ludwin, 34, merchant, and James Smith-Hickie, 26, merchant, who were charged with conspiracy to defraud and with obtaining goods by false pretences.

Mr. Gerald Dodson, opening the case for the prosecution, said that the accused were charged with conspiring together with a man named Anatole Iban Zaitzeff, 54, merchant, who, although he had appeared before the committing magistrates, and been bound over to attend the hearing, had absconded from his bail, and at the present moment the prosecution was unable to arrest him. The two men before the Court, in addition to the conspiracy charges were also charged with defrauding various traders, the method of the frauds being to get goods by representing that they were carrying on a *bonâ-fide* business in the ordinary way, when in reality they got the goods in order to sell them for any price that they might be able to fetch, and put the money in their own pockets. Between July, 1924, and April of this year, they obtained goods to the value of approximately £1,500. Those goods had never been paid for. The defendant Ludwin was a naturalised British subject of Russian origin and was a half-brother to Zaitzeff. The other defendant, Smith-Hickie, got into touch with those two men comparatively recently and occupied a position with them of considerable importance. It was alleged that he was general manager of Ludwin & Co., and managing director of Importex, Ltd. Those two businesses were those which the defendants purported to carry on as genuine businesses. The defendant Ludwin appeared to have begun a business in 1921, or possibly earlier, at 26, Gray's Inn Road, and

he carried on under the style of N. A. Ludwin & Co. In 1923 he removed to an address at 122, Bunhill Row, taking the first floor of those premises. There then came into existence upon the door of those premises the names of a number of businesses and companies. There were the General Distributing Trading Co., Ltd.; British & Overseas Dental Supplies, Ltd.; N. A. Ludwin & Co.; A. I. Zaitzeff & Co., Ltd.; Importex, Ltd.; and the Lancashire Trading Co., Ltd. It was alleged by the prosecution that those businesses and companies had been used for the purpose of giving references to each other. In addition, Counsel said that there was another company called Darag (London), Ltd., but the name of that company did not appear on the door. About December, 1924, Messrs. Hogan and Wardrop, electricians, supplied goods to the value of about £150. They were given three bills of £50 each by way of payment, and those bills were accepted by Ludwin on behalf of Importex, Ltd. The first of the bills was met, but the other two were dishonoured. Ludwin asked Messrs. Hogan and Wardrop to accept payment of £20 weekly until the debt was liquidated. Two cheques for £10 each were given and met. Afterwards, however, Messrs. Hogan & Wardrop were forced to take proceedings and they recovered £29. The balance due to them was £53. Counsel, quoting another case, said that Ludwin had approached the Igranic Electric Co., Ltd., and obtained a large quantity of goods.

At the conclusion of the case for the prosecution Ludwin gave evidence denying the charges. He said that he had been robbed of a large quantity of goods. In his absence from the business goods had been sent by Smith-Hickie, to a firm known as Hoile & English. Witness said, "Hoile & English is a firm carried on by Smith-Hickie's wife and a wife of one of my travellers. Goods I paid 15s. for have been disposed of by them for half that amount." Witness added that Hoile and English owed him £800. If that money had been paid it would have gone to his creditors. Smith-Hickie in the witness-box denied the charges, but admitted that his wife was a partner in Hoile & English. Goods had been supplied to that firm by him.

After a short absence the jury found both the defendants guilty.

The Judge said it was not an ordinary case of long firm fraud. It was not a bogus concern started with the dishonest purpose of entrapping traders, but they sought to bolster up the business by dishonest means. Sentence of six months' imprisonment in the second division was passed on both the defendants.

Theft of Electricity.

At Falmouth Police Court, on September 24th, Frederick Ernest Deeble, principal of the firm of J. H. Deeble & Sons, electrical engineers and yacht furnishers, was charged with fraudulently abstracting electricity belonging to the Electric Supply Corporation, Ltd. It was stated that on July 3rd, 1924, the meters at defendant's premises were inspected by the Corporation's resident engineer and manager, Mr. A. R. Howden, and found in order. On July 9th a meter inspector examined the cut-outs and meter cards, and, two days later, in consequence of information, Mr. Howden examined all the meters, which were in order with the exception of the power meter. That one was unsealed, and a match had been jammed between the revolving disk and the magnet and a piece of bell wire also connected with the terminals inside the meter. Either of these was sufficient to prevent the meter working.

Pleading guilty on behalf of defendant, Mr. H. S. Prideaux said the facts were admitted. The distressing position in which Mr. Deeble found himself was due to a very foolish and ill-considered action on his part. He was ready to assist the Corporation in every way to arrive at the amount of current consumed and to make full reparation. Mr. Prideaux appealed to the Bench to treat defendant as a first offender.

The Mayor said that the magistrates felt that this was a case where the trust and confidence of commercial life was at stake, and they could not do less than fine defendant half the maximum penalty, namely, £25.

Stoller v. Davidson & Co.

In the Whitechapel County Court, on September 21st, before Judge Cluer, a reserved judgment was delivered in a case in which Abraham Joseph Stoller, Stepney, E., sued Messrs. E. Davidson & Company, Stepney, E., electrical engineers, to recover £3 15s. 6d. for an accumulator entrusted to the defendants on May 8th for charging and destroyed by fire the same night on the defendants' premises. The case was heard in July. A member of the defendant firm said that the fire was caused through accumulator acid leaking. If the acid touched anything, it would complete a circuit, cause a spark, and so give rise to a fire. A faulty or leaky accumulator was not usually taken to an electrical engineer for charging. Judge Cluer said that the plaintiff had to prove that the defendants had been negligent. So far as the evidence went, the fire was not caused by any negligence of the defendant firm. Judgment was accordingly entered for the defendants, with costs.

The Mersey Tunnel.—Work upon the construction of the new Mersey tunnel is to commence at an early date under the supervision of Mr. Basil Mott and Mr. J. Brodie, the City Engineer of Liverpool.

Published Specifications.

Compiled expressly for this journal by Patent Agents.

The name of the applicant's patent agent, if any, will be found on the printed specification.

The

Electrical Review

VOL. XCVII. OCTOBER 9, 1925. No. 2,498.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone Nos.: Central 8260 and 8261

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

New Electricity Supply Areas.

THE report recently issued by the Minister of Transport respecting proceedings under the Electricity Supply Acts includes a list of the Special Orders made by the Electricity Commissioners during the year under review (to March 31st, 1925). A rough analysis of these Orders may be of interest as indicating the new territory which will thus be catered for in the way of electricity supply, who are the enterprising authorities, and generally the direction which developments are taking.

There are 73 Special Orders altogether, of which 72 authorise supply to new areas and one authorises a transfer of part of an undertaking. Of the 72 Orders for new areas, local authorities have promoted 33 and companies (or persons) 39.

From the nature of the case, all these Orders refer to country areas or small towns. Two of the Orders refer to "cities," but these are the city of Lichfield and part of the city of Wakefield. For the rest, the Orders relate to county boroughs, urban and rural districts, and parishes.

From the point of view of the much-discussed rural development, it is interesting to note that out of the 72 Special Orders, 47 Orders are for supply to rural districts, covering indeed the big number of 93 rural districts in whole or part. The urban districts covered (68) are, of course, also almost exclusively country areas. To the foregoing have to be added 26 parishes and 20 boroughs (of which the most important is, perhaps, Newark-upon-Trent).

One interesting aspect of these Orders is the indication they give of an increasingly popular policy with local authority undertakers, namely, that of extending their areas of supply to the surrounding rural districts. One of the most ambitious of these is Luton, which is extending outwards in a very wide sweep, including Dunstable and rural districts in Bedfordshire, Buckinghamshire, and Hertfordshire. The Bedford undertaking is likewise extending its boundaries, so that these two local authorities will together cover a fairly extensive area.

Worcester is similarly proposing to supply the rural districts to a three- or four-mile radius round the city. This is an element in the South-West Midlands District scheme. Sheffield, Middlesbrough, and Leicester have also secured Orders for extensions into the surrounding country. Of the provincial companies which are similarly expanding their boundaries, the Northampton Supply Co. has a fairly ambitious programme under its Order covering extensive rural and urban dis-

tricts and Daventry. The Oxford Company is extending to Woodstock and elsewhere, and the Abingdon Company is also expanding. The two undertakings, we understand, either have been or will be interlinked. Another company which is interested in rural supply, in fact, mainly engaged in it, is the Western Electric Distributing Corporation, whose West Wilts. Order covers Chippenham, Devizes, Westbury, and a comprehensive slice of that rural country. The power companies are also getting new customers for their bulk supplies by taking out Orders. The Lancashire Power Co. has obtained an Order for the urban district of Golborne, and Electrical Distribution of Yorkshire, Ltd. (the feeder to the Yorkshire Power Co.) has taken out three Orders covering a formidable number of rural and other districts, some 28 altogether. The Lothians Electric Power Co. is fulfilling its obligations (in partnership with the Edinburgh Corporation under the Edinburgh and Lothians Electricity District scheme) to provide "a cheap and abundant supply of electricity", within the portion of the district for which it is responsible, by an Order with a voluminous list of burghs and parishes.

Finally, there is the London and Home Counties Electricity District, which offers very little scope for new Orders. Nevertheless, the few remaining unappropriated spots are being decreased in this list by the following: The County of London Co. has taken Orders for some of the unappropriated areas of Essex, the Leatherhead Co. has staked out a claim in the Epsom rural and Guildford rural areas, the Egham and Staines Co. and the Woking Co. have secured such parts of the rural district of Staines as are innocent as yet of electricity supply, and the Urban Co. has taken up uncatered-for areas in the rural districts of Reigate and Godstone.

In view of the interest attaching to the changing panorama of electrically supplied areas, we have thought it worth while to commence to publish a series of maps illustrating the position up to the time of printing. In some parts of the country, practically the whole area is already parcelled out to statutory undertakers, and, of course, almost all of the "unoccupied areas" are of the rural type, wherever they are met with. We shall deal first with the counties which are still far from completely covered, and afterwards with those offering less scope for new enterprise, omitting counties the whole of which has been allotted to the care of authorised undertakers of one sort or another. The first of these maps, dealing with Bedfordshire, Bucks and Northants, appears in this issue.

Rural Overhead Lines.

Recent correspondence, following on comments in these pages, has recalled attention to the regulations which control the construction of overhead lines for pressures above 125 volts, and to the restrictions thereby imposed upon the development of electricity supply in rural areas. It may not be generally realised that the residents in such areas, which have hitherto been regarded by many as an unpromising field for electricity, are eager to avail themselves of its benefits directly the mains come within hailing distance, and the only obstacle to the satisfaction of their longing for release from the tyranny of the paraffin lamp and oil-cooking stove is the cost of the transmission lines.

That the existing regulations seriously impede rural development is certain, and that there is no necessity for their excessive stringency has been witnessed by Mr. W. Fennell and Mr. R. Borlase Matthews in our columns, whilst we have repeatedly received similar testimony from other engineers in private conversation. Further corroboration was given by Mr. R. B. Mitchell, president of the Incorporated Municipal Electrical Association, at the recent meeting of the Institution of Public Lighting Engineers at Leeds; as reported elsewhere in this issue, Mr. Mitchell, who is chief electrical engineer to the Glasgow Corporation, referred to the rapid extension of electricity supply that is taking place in rural areas, and declared that the "very rigid Board of Trade regulations" were a great handicap to the development of rural electric lighting. Mr. E. C. Lennox, the author of the paper under discussion, who is familiar with rural distribution, agreed, and said they could hardly move for the regulations "rigidly round their necks."

We feel sure of two things: that we are making ourselves ridiculous in the eyes of the rest of the world by maintaining these restrictions, to the detriment of everyone concerned; and that if the electrical fraternity unanimously expresses a wish for the drastic revision of the regulations, the Electricity Commissioners will be found very willing to accord a sympathetic hearing to its representations. So far as the Post Office requirements are concerned, we have in the letter of Mr. S. C. Bartholomew, published in our "Correspondence" columns to-day, evidence that the Engineering Department is by no means unfriendly to the development of rural electricity supply networks, and, with other information which has reached us, we are encouraged to believe that in no long time from now the situation will be materially improved.

The Electrical Outlook in China.

He would indeed be a bold man who would seek to prophesy what prospects China offers in the immediate future for the British electrical exporter. Those enterprising spirits who, decades ago, foresaw that they could benefit China as well as themselves by introducing modern methods into Chinese industrial life and who devoted their capital and energy to building up a market for electrical apparatus and supplies have passed through a period of serious anxiety in recent years. Civil war and brigandage have combined to hamper transport and trade. With the gradual undermining of the authority of the central Government the finances of the country have gone from bad to worse. Throughout the land the treaty rights under which the whole system of Chinese trade has been built up have been increasingly disregarded. Yet amidst this growing unrest and dissension there have been wonderful examples of vitality and recuperation. Customs receipts, which have remained under foreign control, have shown increases where none was expected, and in the foreign trade returns there have also been advances. It is true that the statistical records go no further yet than 1924. The progressive decline between 1921 and 1923 in the tael value of imports of electrical material and fittings was arrested in 1924. In that year their total value was Hkwn. tls. 8,420,098 against Hkwn. tls. 8,266,181 in 1923. What the 1925 figures will be it is hard to say, but we have always urged the British exporter to cultivate the Chinese market, and we still believe that in time he will reap his reward. British material and workmanship still bear a high reputation. The Chinese have not forgotten some bad accidents that took place not many years ago owing to the use of inferior foreign electrical apparatus. Whilst the principal users of electricity are cotton mills, flour mills and oil mills, the most promising line of development at present is in lighting, from town schemes down to small units of 2½ to 10 kW for provincial residences. Hydro-electric plant is practically non-existent, although water power is available in many districts.

It has always been said of the Chinese market that, despite political troubles and internal disorder, business at the Treaty ports would thrive; but Bolshevism, boycott, and strike have so damaged business in recent months that it will take a long while to remedy the disaster. Yet there are a few rays of hope in an otherwise gloomy outlook. In contrast with the turbulent spirits who have been fomenting the anti-foreign movement, many Chinese industrialists thoroughly recognise that the future of the country, like its past, lies in the co-operation of the foreigner. The old-established Chinese merchants are men of great business acumen, and it is their influence as much as any that has led to the fixing of the date for the long-deferred Tariff Conference and to the settlement of the Shanghai strike. An attempt has even been made to produce some semblance of order and authority in Peking by the time the conference assembles there on October 26th. The British delegates have been told by Mr. A. Chamberlain

that, when dealing with the question of raising Customs duties, they must require security for China's performance of her promise to abolish the internal duties known as "likin." On the other hand, the great difficulty is to find amidst the welter of party faction any authority whose promise is likely to be performed. A change for the better may, however, emerge from the fact that, apart from the Bolshevist agitation, there is a truly national movement for freeing the country from foreign control and influence. This national movement is the more moderate of the two, and it is hard to believe that with the example of Russia before them the saner elements will not be able to check Bolshevism. They must be persuaded to use their efforts to place in power responsible men who by their actions can convince the foreign Governments of their ability to restore order and protect life and property. When that is accomplished it will be time to talk of abolishing ex-territorial rights and doing without the foreigner. And unless that is accomplished China must expect henceforth to do without foreign capital or foreign co-operation and to see her agriculture and industries wither and decay.

Hungarian Railways.

It is reported that a Franco-Spanish group has dispatched representatives to Budapest to investigate the possibility of the electrification of the Hungarian railways, this group being said to be the same as has been interested in the conversion of Italian railways to electric traction. An English group is stated to have prepared a scheme some months ago for the construction of a power station based on the utilisation of the lignite mines of Varpalota for the supply of power for the working of the Trans-Danubian railways, but the project proved to be too costly. It is assumed not to be out of the question that the Loucheur group is at the back of the Franco-Spanish group, the former having acquired the majority of the shares in the Phoebus electricity works a few months ago, which supplies the vicinity of Budapest, and also having obtained an interest in the electrical and transport undertakings, which own many electricity works in the provinces and in ceded territory. If the scheme for the conversion of the railways should be realised the Franco-Spanish group would appear to be approaching the position of being able to control the electricity supply system of Hungary.

The German Wireless Apparatus Industry.

Dealing with the second large radio exhibition in Berlin, which has recently been closed, and which is dealt with elsewhere in this issue, Herr Hamm, of Charlottenburg, states that it was a great success, there having been 250 exhibitors and over 400,000 visitors. The economic results were not so brilliant as might appear from the outward circumstances, but most of the firms were satisfied. This is regarded as a very favourable situation having regard to the serious state of distress that the German radio industry experienced during the first two years of its existence. The impression is gained that the state of chaos has been ended and has been succeeded by quiet development. In itself the radio industry has been strengthened; it is controlled by the syndicate of the wireless industry, which also possesses a kind of monopoly for the Telefunken licence, which is provisionally indispensable. Moreover, a smaller syndicate exists, but this only comprises producers of component parts, and so far it has not become of any importance. The policy of the former shows unmistakably the endeavour to prevent, or as far as possible render difficult, the establishment of new concerns. Practically no new firms were noticed at the recent exhibition, but some names have disappeared since the initial period. The tendency of the technical economic development lies in the direction of bulk production, in conjunction with standardisation. The large reduction in prices which has taken place since the spring of 1924 can only be borne if the organisation of manufacturing yields the highest possible results. Whereas a four-valve set at that time was priced at 500 marks and then dropped to 350 marks, one firm has now produced a three-valve set at 135 marks, which can be converted to a four-valve set at an additional cost of 50 marks. If good component parts are used it is impossible at this price to get more than an insignificant profit, so that compensation must be sought for in bulk production. As for the quantities concerned, Herr Hamm states that one of the most important firms in the "low-pressure" branch produces 3,000 double receivers daily, which number is sold and could be increased to 10,000 daily if the works could turn out this number, while a smaller firm constructs 50,000 per month.

Concerning the export possibilities of the German radio industry, Herr Hamm states that these are still favourable. For instance, a head-'phone costs from 8 to 14 marks in Germany according to quality, whereas the price in England and America is 20s. It is argued that with such a price difference Customs barriers cannot entirely stop the export trade, and, in fact, large quantities are being exported to America which are not yet specifically enumerated in the German official statistics.

Suggestion Schemes.

The basic idea of the suggestion scheme is unquestionably a sound one; there is nothing Utopian about it, and it can be abundantly justified on purely utilitarian and economic grounds. Where a scheme has really succeeded, it has given satisfaction to all parties directly concerned. At the same time, however, the history of actual experiments in this direction, it is to be feared, makes but mixed reading. There have been, and there are, quite notable successes; but there have been also failures. Unfortunately, it is the derelicts and cripples which are most noticed and commented upon, and all too often the efficient schemes are passed by in silence. There is certainly no inherent reason why a wisely conceived, soundly executed programme should not fully satisfy all reasonable expectations. A sound scheme working smoothly not only aids efficiency, it is itself a token of efficiency. It also suggests confidence, and may express even cordiality, in the relations as between management and executive. These are prime essentials.

Probably the foremost reason why so many of these experiments are still-born, or fail to reach maturity, is just the fact that those responsible for their inception, and entrusted with their execution, overlook the human element that is involved. The psychological factor here looms large: nowhere, indeed, is it more in evidence. It has to be remembered that success is the logical outcome, not of a purely negative thing, as mere acquiescence, but of something positive, as a species of enthusiasm. More than that, the enthusiasm has to be shared; in other words, there must be keenness alike to solicit suggestions, on the one hand, and to offer them on the other. Employers and employés must be at one in this that they welcome the facilities the scheme provides. In addition, it is most necessary to obviate, if possible, all covert opposition from intermediary officials. To this end everything must be above board, and all concerned must be assured of a square deal. Suspicion, more than anything else, kills all such enterprises. Put in skeleton outline: The employers solicit proposals which shall ensure increased efficiency, &c. They promise that careful consideration shall be given to all suggestions submitted, and state in general terms the kind of thing they want. The offers which are accepted they will pay for at a fair price. In any case, they will give a reasoned reply when a suggestion has been turned down. The rest is matter of detail.

For those interested in the subject who wish to study details of actual schemes, and to realise more fully what is involved, a brochure entitled "Suggestion Schemes," prepared by the Industrial Welfare Society, of 51, Palace Street, Westminster, S.W.1, can be recommended.

Guiding principles, exposition of schemes, details of working, including suggestion box and other methods, questions affecting adjudication and assessment of values, and of dealing with appeals, are all treated with judgment, and clarity. The nine appendixes in particular give just the kind of data that those thinking of inaugurating an actual scheme will find of most use.

Mining Electric Locomotives.—II.

Battery-Propelled Machines submitted for the Markham Competition.

It is of interest to record the fact that of the five locomotives which competed in the final tests for the £1,000 prize offered by Sir Charles Markham for a machine suitable for use in place of the pit pony for the haulage of tubs in coal mines, three (including the prize winner, which was described last week) were fitted with standard Kathanode batteries manufactured by the D.P. Battery Co., Ltd.

The locomotives had to be designed to meet the arduous conditions met with underground. The machine built by the Metropolitan-Vickers Electrical Co., Ltd., was designed in accordance with the specification drawn up by the promoters of the competition; it was found impossible, however, to adhere to the weight specified and at the same time construct a locomotive which the designer considered to be sufficiently robust for all underground duties. The electrical gear was kept as simple as possible, and the M.V. machine is actually capable of turning through an angle of 90 deg. on a 13-ft. radius with an overhang not exceeding 10¼ inches, *i.e.*, 1¼ in. less than that specified.

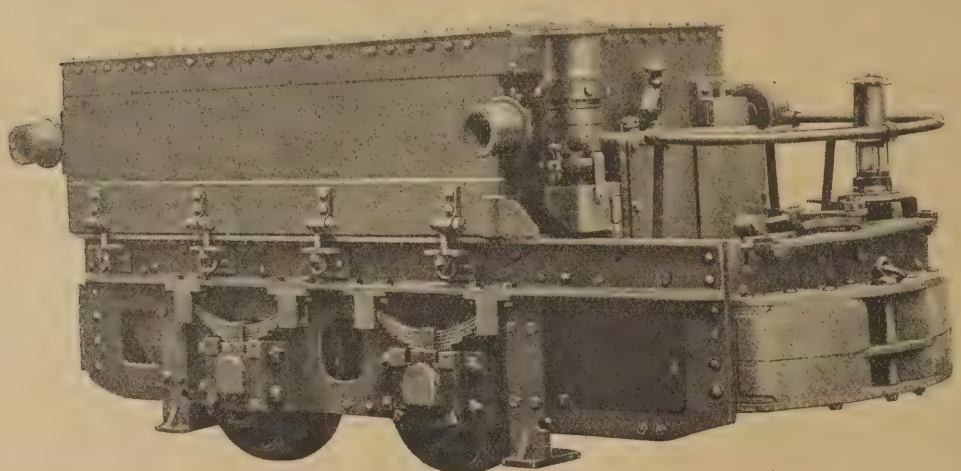

Fig. 1.—Metropolitan-Vickers Mining Locomotive.

The Metropolitan-Vickers Locomotive.

This machine is illustrated in figs. 1, 2, and 3; its battery was manufactured by the Chloride Electrical Storage Co., Ltd., and is of the "Exide-ironclad" locomotive type, consisting of 35 LMV-10 cells, which type of cell can give heavy current discharges without undue drop in the voltage, thus maintaining speed when negotiating steep inclines. The battery has a capacity of 323 ampere-hours at the 5-hour discharge rate; sufficient mud space is allowed, so that cleaning out is unnecessary during the life of the plates, whilst the head room over the plates is such that topping-up is minimised and acid sloppage practically impossible, qualities that make for trouble-free service.

The battery compartment is flame-proof and strong to withstand an internal explosion or a fall of roof; it is fitted with wide flanges separated by distance pieces to provide sufficient ventilation, the arrangement being such that it is impossible for the hot flame of an explosion to communicate with the outside atmosphere. All the terminals inside the batteries are suitably protected from short circuit. The case is made additionally strong by dividing it into three separate compartments which have specially wide flanges between them.

The two motors, one on each axle, figs. 2 and 3, are spring-suspended in the usual locomotive manner. The drive is through a double reduction chain, the high-speed chain being totally enclosed. The motors are enclosed in flame-tight covers, the terminal boxes being cast to the motor frame and forming separate flame-tight compartments through which the leads are taken by means of flame-tight bushes. Suitable inspection doors are provided for the motors in accessible positions.

The controller, enclosed in a flame-proof box, is of the cam-operated contactor type with a blow-out coil on each contactor; in addition, two interlock line switches with an overload relay are provided. The motors are reversed by means of a separately interlocked drum, the arrangement being similar to that provided on the standard Metropolitan-Vickers locomotive controller. This reverse drum is operated by a removable key which can only be taken off in the "off" position and also in this position the controller handle is locked so that it cannot be moved. In addition, the interlock is such that it is impossible to operate the reverse drum unless the controller handle is in the "off" position. The controller handle is of the "dead man's" type, and is so arranged that in the event of the handle being released the current is immediately cut off from the motors, and before it is possible to start up again it is necessary to return the controller handle to the "off" position. A flame-tight receptacle is provided on the battery box, into which a suitable plug engages. When the locomotive is in commission this plug is locked in place; similar locks are provided on the controller case so that it is impossible for any unauthorised person to open the controller case or remove the battery plug. In order to remove the battery box from the chassis, four special rollers are provided, which are detachable. These wheels would be kept in the charging station and would only be fitted at the station when it is required to replace a battery. The wheels engage with a side track, and the track on which the locomotive runs is slightly inclined to the horizontal, so that the weight of the battery is taken on the wheels provided, and by slacking off the retaining bolts it is possible for the battery box to be lifted out clear of the chassis. The locomotive chassis can then be run out to the re-charge battery station, where a reverse process takes place.

The locomotive has brakes on each wheel. The brake gear is of the compensated type and can be operated by either foot or hand. In order to lessen the possibility of generating sparks of sufficient heat to ignite gas when braking, the shoes have been lined with Ferodo. Sand boxes have been provided for each direction of running and are operated by suitable foot levers.

The Patterson Locomotive.

The rectangular steel-plate body of the machine (fig. 4) submitted by Messrs. R. H. Patterson & Co., Ltd., of Newcastle-on-Tyne, is 18 in. square and open underneath, the cab being attached to an extension of the frame and of equal strength to the main body. The overall dimensions are: length, 8 ft. 3 in.; height, 3 ft. 5½ in.; and width, 3 ft. 1½ in.; the wheel base is 22 in., and the maximum overhang on a 13-ft. curve is 7⅞ in. outside the outer rail. The weight of the complete vehicle is 2 tons 15 cwt.

The 10½-b.h.p. intermittent-rated, series-wound, totally-enclosed motor (by Messrs. Clarke, Chapman and Co., Ltd., of Gateshead) operates at 64 volts and a speed of 1,200 r.p.m. for full-load speed. The steel yoke has facings to fit exactly between the vertical members of the chassis and is rigidly bolted and dowled

to it. The transmission end of the motor shaft is enlarged, bored, and splined to take the driving shaft of a (Messrs. D. Brown & Sons) worm reduction differential mechanism, which is contained in a steel casing built into the main chassis. The reduction gear has a ratio of 10.5 to 1. The driven shafts of the differential

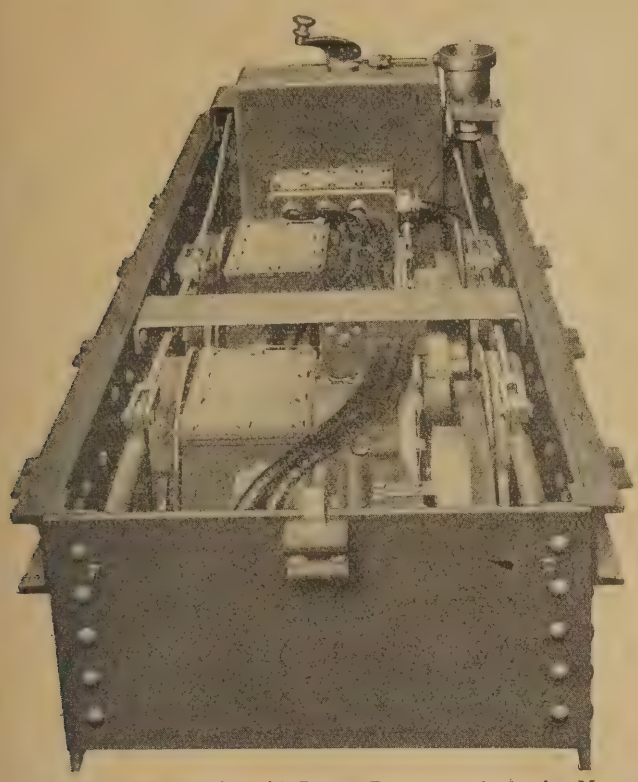

Fig. 2.—M.V. Locomotive with Battery Box removed, showing Motors.

extend through the sides of the chassis, and have two steel driving disks rigidly secured to them, each driving disk being provided with a nickel-chrome steel crank pin at 4½ in. radius

The track wheels have steel centres and main-line quality tires, and are mounted on the ends of the fixed axles with Hyatt roller bearings enclosed in the bossing of the wheel centres. Crank pins of nickel-chrome steel are secured to the track wheels at 4½ in. radius, and a compensated driving yoke of triangular form connects each set of wheels and the driving disks, one set on each side. In this manner differential action is transmitted to the track wheels through the driving yoke. The bearing taking the crank pin of the driving disk is a phosphor-bronze solid block sliding in the jaws of the driving yoke, and supported by a steel spring. The wheels are mounted in cast-steel horn blocks, sliding in machined pockets on the main chassis, and supported by steel springs of the same strength as the springs on the driving yoke. The bearings connecting to the track wheel cranks are of the "SKF" radial double-track ball type.

A totally-enclosed flame-proof controller (made by the Electro-Mechanical Brake Co., West Bromwich) is situated in the cab, combined with the same firm's flame-proof "unbreakable" resistance and a circuit breaker of the tramway type (by the English Electric Co.) enclosed in a flame-proof casing with automatic blow-out and handle control. A notched gate device on the controller lever ensures the steady cutting out of resistance step by step, it being impossible to short circuit across any step of the controller, and a mechanical spring return gives a "dead-man's" effect in case of accident to the operator, the controller handle returning to zero the moment it is released.

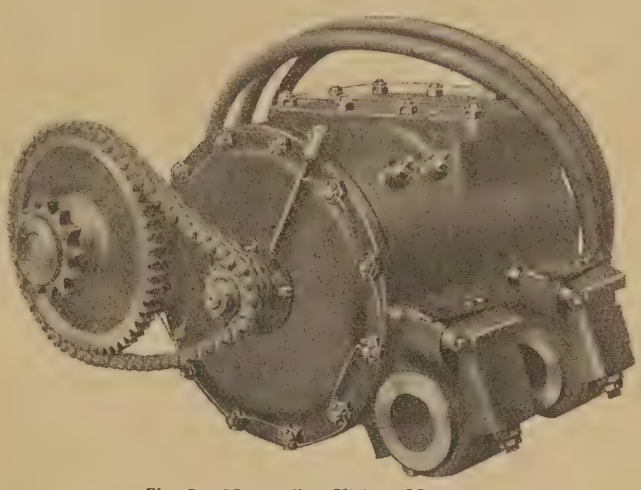

Fig. 3.—Metropolitan-Vickers Motor.

Brake drums 12 in. in diameter by 2½ in. face are formed on the back of, and concentric with, the driving disks on each side. The two brake posts are curvilinear, and are pivoted on adjustable fulcrums mounted on the chassis. At the other end, a tension bolt passes through the extended ends of the brake posts, and is fitted with check nuts on the lower side, and cams mounted on the ends of the lay shaft engage with the upper leaves of the brakes, the tension head bolt being pivoted within the cam heads, so that upon the lay shaft being rotated by link and lever, the cam depresses the top leaf, and by imparting an axial motion to the tension bolt pulls the lower leaf equally and oppositely. The brake leaves are held open by a coil spring on the tension bolt, and the two brakes are synchronised to work simultaneously. Control is exercised by a lever with clutch and quadrant in the cab.

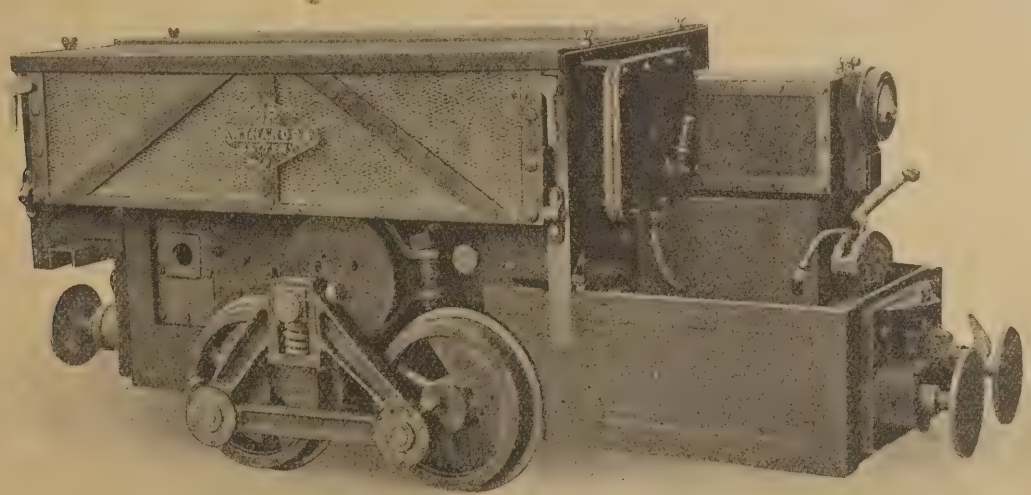

Fig. 4.—The Patterson Mine Locomotive.

The TR-29-type 32-cell lead-acid battery of the "Kathanode" series (manufactured by the D.P. Battery Co.) is contained in four teak crates, each portable by itself. The four crates straddle on the top of the chassis in a cage formed with two rigid end plates and two portable hinged doors, with portable cover. The terminals and inter-cell connections are heavily covered with rubber to ensure freedom from open sparking, and a voltmeter is fitted to show the open-circuit voltage as an indication of the battery's condition.

Steel headstocks with spring buffers and draw hooks are fitted at the forward and after ends. Sanding boxes are provided with dead-lift valves operated by pedals from the cab, one pedal controlling the forward pair and a second the after pair. The full-load haulage speed on a gradient of 1 in 24 is five m.p.h., the light speed being approximately seven m.p.h. The draw-bar pull has been tested to be between 1,100/1,200 lb.

The principal feature of the Patterson machine is the method of transmission between the prime mover and the track wheels. The differential gear imparts a differential action in curving to the driving frames, which, in turn, dispose the power in exactly equal parts to both track wheels. The spring-compensated sliding block gives a cushioning effect to the driving pin when starting under load, and also gives the wheels freedom to move vertically without straining the driving yokes in any way.

Control Gear for Beet Sugar Manufacture.

By J. O. KNOWLES, M.A.

In the manufacture of beet sugar large quantities of low-pressure steam are required for process work from the diffusing of the beet liquor to the refining of the crude sugar. This fact in itself suggests that electric power can be generated at a very low cost in the sugar factory, because the enormous condenser losses of the usual power station (comparable as they are to the actual electrical energy produced) can be at once diminished by using a turbo-generator exhausting into the process service instead of into a condenser.

The power required for the handling of the large quantities of materials is in the aggregate considerable and this power is required at widely scattered points in the process routes. Electrical drive is therefore a foregone conclusion, both because of the low cost of generation under the conditions stated above and because of the convenience and economy of electrical and individual drive as against a possible alternative of steam or Diesel-engine drive. Apart from these questions of cost and economy, the one essential for the auxiliaries is reliability. This is true of all process work, and of sugar manufacture in particular, because of the quantities handled in a continuous succession of processes, and because of the comparative instability of the syrups in the process stages and the demand for quality in the finished product.

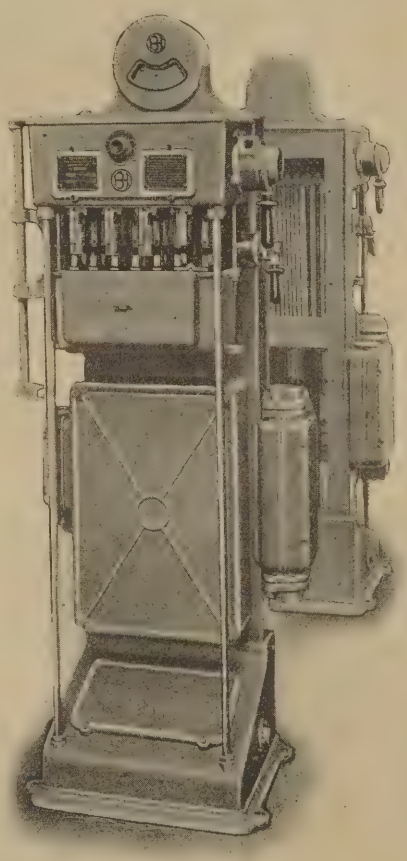

Fig. 1.

Variation in the speed of the driving motors is not a very important matter in most of the processes, as the quality of the product is governed by temperature, and the length and repetition of processes. Thus the only serious objection to the use of a.c. supply is removed, and the electric drive becomes a fairly simple problem in the selection and control of the right motors for the various working conditions.

Most of the motors will be required for handling the materials from one stage to another, the chief exception being the drive of the slicing machines for cutting the beets into small pieces preparatory to the extraction of their juice by diffusion. A slicing machine approximately 7 ft. in diameter, of the annular type (in which the beets are fed into a hopper so as to fall into an annular space where knives moving in a horizontal circle slice them across) will cut some 300 tons of beet in 24 hours, sufficient, that is, for about 35 tons of sugar. The starting duty of the slicing machine motors will, of course, be fairly heavy, so that wound-rotor motors are required and the starters should be of the step-by-step type with liberally rated starting resistances. Fig. 1 shows a suitable starter with a ratchet (step-by-step) handle suitable for operation by men having no electrical knowledge, the starting switches being of the multiple drop-switch type so as to give a quick certain movement on each step, without danger of breakdown by severe burning, such as might occur if a slowly moving contact arm were used. The drop-switch type stator circuit breaker is mounted in the same pillar, so that the whole forms a compact unit (with its own resistances) that can be set down in a convenient position without the necessity of making interconnections and interlocks on site.

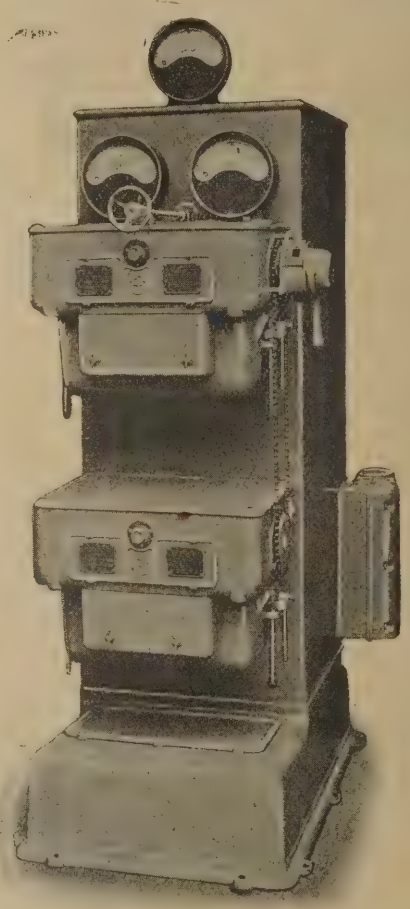

Fig. 2.

Alternatively, a synchronous motor may be used on the heaviest drive so as to keep up the power factor and improve the efficiency of the whole system. The motor will be started as a wound-rotor motor with a re-

sistance in the rotor circuit. When all the resistance has been cut out of circuit, the motor will be running at nearly synchronous speed (*i.e.*, with a small slip of, say, 5 per cent.). The rotor circuit is then opened again to superimpose on the rotor current an additional current from the exciter. The switchgear required will comprise a stator circuit breaker, a rotor starter, a change-over switch in the rotor exciter circuit and an exciter field regulator. The stator circuit breaker, which will be of the oil-immersed drop-switch type (with no-volt and overload releases), may be mounted with the change-over switch and the rotor starter in one pillar as shown in fig. 2, or for large motors, the rotor starter may be separated from the circuit breaker in another pillar. The liquid type of starter has also certain advantages for large isolated motors which it has not for the control of smaller motors. For large motors the liquid starter is comparatively small in size, easy to maintain (in large individual units), and gives a smooth start.

Having considered the power plant for the heaviest drives, and general questions of speed variation and load factor, the most suitable type of supply is practically settled.

Apart from the slicing-machine drives, the other motors are largely required for handling the product from process to process. The conveyors practically describe the sequence of processes, for the bulk of the material dealt with is such that mechanical handling is essential. Thus conveyors are required for bringing the raw beets to the washers (through which they are conveyed by spiral arms on a horizontal shaft.). Elevating conveyors are then needed for loading the slicing machines, which may be placed over the diffusers so that the slices can fall by gravity. In the next few processes the main product is in the form of a liquor, but the waste products—the fibrous residue of the beets from the diffusers (where the liquor is pressed from the beets), the carbonate of lime from the saturator (where the liquor is reduced to sugar in solution), and after evaporation and concentration the "char" or charcoal from the refiners require mechanical handling. Finally, the crystallised sugar from the vacuum pans must be removed, sorted, and packed, and the finished product dispatched.

For the various conveyors, auto-transformer starting will usually be the most satisfactory. The initial torque required to start heavy laden conveyors against considerable bearing friction is too great for satisfactory star-delta starting, and yet a squirrel-cage motor (protected by a well-designed starter in which the change-over cannot be made too soon), is sufficient without the added expense of a wound-rotor motor. A further safeguard is an overload restrainer which automatically lowers the overload cores, not right out of circuit, but sufficient to prevent the trips operating on the normal current peaks in switching to the "start" and "run" positions. In the case of long runs, where several conveyors must be used in series, an auxiliary contact can be fitted on each starter to energise the no-volt coil of the starter before it in sequence, so that no conveyor can be started unless the next conveyor is already in motion to remove the conveyed material.

Apart from solid materials, circulating pumps are required for passing the liquor from the beets through the saturators and filters, though the plant will no doubt be arranged to use gravity where possible. For some of these pumps wound-rotor motors may be required, especially where the lift is exceptional or the volume of stationary liquid to be set in motion is considerable. A suitable controller for the larger pump motors is shown in fig. 1, already described, but for smaller pumps up to, say, 10 h.p., a simpler type might be used to reduce the high cost of using a wound-rotor motor (where necessary), without diminishing the factor of safety. While some of the features that are advisable for protecting larger motors may be omitted or modified, the construction should be strong even in the case of those parts which are too often made of light material because they only carry small currents. For such small starters mechanical strength is of greater moment than electrical capacity. Especially in process work is it important that the small auxiliaries should be as sound a job as the larger plant.

Besides conveyors and pumps, a number of fans will be required for circulating air and gases. In the first place, CO_2 must be produced (by calcining limestone) and pumped into the saturators for treating the different liquors, to remove the lime as carbonate of lime. Then sulphurous acid gas is needed to decolourise the resulting juice from the lime filters, and after evaporation and concentration in vacuo, air fans are still required for drying the sugar. Star-delta starting can be used for the fans, but in some cases it is essential to have some means of altering the draught or air pressure. A good combination (to save the expense of wound-rotor motors with wasteful rotor resistances) is to use a two-speed motor in conjunction with a baffle in the air-pipes. These two-speed motors have two separate stator windings and a squirrel-cage rotor. When starting, the low-speed winding is switched on first (by straight-on, star-delta, or auto-transformer starting) and an extra switch is provided in the starter by which the high-speed winding is switched in (the low-speed winding being cut out by the same movement). By using the two speeds in connection with regulation of the baffle almost any required draught can be obtained economically.

A few other special drives are required, such as stirrers for the washing conveyors and melting pans, and of course the power plant auxiliaries are necessary if power is to be produced at the sugar works as suggested in the first paragraph.

Beet sugar manufacture does not differ very much from cane sugar manufacture. The yield per acre and the yield of sugar is now about the same (about 25 tons of beet or 3 tons of sugar per acre), and a large plant would deal with 1,000 tons of beet in 24 hours. The cane sugar factories have, of course, the advantage of cheap labour, but the beet sugar industry, with Government help, is now developing quickly in this country, and provides a new opening for business in electrical manufactures.

The writer is indebted for the photographs and some of the information in this article to Messrs. Brookhirst Switchgear, Ltd., of Chester, who are at present engaged on the manufacture of control gear for several of the new beet sugar factories being erected in this country.

High-pressure Transmission Masts.—Our German contemporary *Elektrotechnik und Maschinenbau* published in a recent issue an interesting article on the respective merits and costs of wood, steel, and ferro-concrete masts for the support of high-pressure transmission lines. The author considers that wooden masts are not suitable for lines working at a higher pressure than 35,000 volts, and even then are liable to cause interruptions. It is possible to get wooden masts that will carry lines working at higher pressures, but they are almost as costly as, and less durable than, steel or ferro-concrete masts. The author strongly favours the latter, and on the question of their durability, draws attention to the fact that they have been used for twenty years in France and for fifteen years in Austria. The only advantage, he considers, that can be put forward in favour of steel masts is that they can be taken down and rebuilt in new positions. This is, however, a convenience rarely required in connection with high-pressure lines.

Automatic Oil Purification.—Now that the principle of the employment of centrifugal separators on motor ships for the purification of fuel oil is becoming more generally recognised, interest is being centred in the details of the installation of such plant in order that the maximum efficiency and convenience of operation may be obtained. In this connection the arrangement which is being utilised on one of the new Holt Line motor ships now under construction at the Caledon yard illustrates the automatic operation of separators. The daily consumption of fuel oil will probably be in the neighbourhood of 13 tons, and this can be handled by one of the two De Laval machines working only a certain number of hours per day. According to the *Motor Ship*, the system is entirely enclosed, and is provided with an automatic controller, which not only regulates the maximum throughput, independent of the variable temperature of the oil, but also controls the head of pressure of the oil. The fuel is first passed through a coarse strainer, thence to the electrical heater, and finally to the purifier. The clean oil tank has an automatic float operating the regulating valve from the electric heater, and when closing it the electric current to the heater is switched off, thus preventing the oil from being overheated.

Electricity Supply in Great Britain.—I.

The Present Position with Regard to Statutory Powers.

Since the Electricity Commission was established in 1920 considerable progress has been made towards the accomplishment of its primary purpose—the reorganisation of electricity supply throughout the country; most of the Electricity Districts have been definitely delimited, and in some of them Joint Electricity Authorities or Advisory Boards have been set up, whose function it will be to ensure that further development shall be accelerated, with the ideal in view that every part of the country shall eventually be provided with a supply of electricity, generated and distributed on the most economical lines. The Commissioners have also granted a large number of Special Orders, supplementing the Provisional Orders and Acts of Parliament under which electricity is distributed and thus greatly extending the area covered by statutory powers.

There still remain, however, considerable areas over which no authorised undertakers have the right to supply electricity; many of these are more or less adequately catered for by companies or persons as yet unprovided with statutory powers, but for our present purpose, following the practice of the Electricity Commissioners, we shall regard these as "unoccupied areas," without prejudice to the possibility—in many cases the probability—that the unauthorised undertakers will eventually take steps to secure Special Orders and join the ranks of the elect. We propose to publish a series of maps showing the areas which are not yet covered by statutory powers, using for this purpose (by permission of the Controller of H.M. Stationery Office) the Ordnance Maps prepared for the Boundary Commission of 1917, which give the boundaries of county boroughs, rural and urban districts, and parishes. These maps, on a scale of 4 miles to one inch, can be got from Messrs. Edward Stanford, Ltd., price 6d. each.

The information on which the maps are based is to be found in the most convenient form in the Electricity Commissioners' volume of Returns of administrative particulars relating to authorised undertakers, published in January, 1925; but as these data are correct only up to the end of 1923, they have been supplemented with particulars contained in the Commissioners' Annual Reports, the *London Gazette*, and other publications obtainable from H.M. Stationery Office, bringing the information up to date. The map reproduced on the opposite page shows the various municipal boroughs, urban districts, rural districts and parishes contained in the Administrative Counties (divided by thick lines) of Bedford, Bucks, Northants, and Soke of Peterborough, together with the County Borough of Northampton. This area comprises 1,420,914 acres, and contained a population of 791,996 persons in 1921. The assessable value of the total area is approximately 4½ million pounds. As far as can be ascertained from the various available records, no statutory powers for the supply of electricity are held, nor has any application been made for them, in respect of the portions of the area shown on this map which have not been hatched.

The following is a list of authorised undertakers whose areas are wholly or partly included in the map:—

Local Authorities.

Aylesbury Corporation.
Bedford Corporation.
Luton Corporation.
Maidenhead Corporation.
Peterborough Corporation.
Kettering Urban District Council.

Companies.

Chesham Electric L. & P. Co., Ltd.
Cookham and District Electricity Corporation, Ltd.
First Garden City, Ltd.
Northampton Electric L. & P. Co., Ltd.
Rushden and District Electric Supply Co., Ltd.
Slough and Datchet Electric Supply Co., Ltd.
Uxbridge and District Electric Supply Co., Ltd.
Wellingborough Electric Supply Co., Ltd.
Windsor Electrical Installation Co., Ltd.

The Metropolitan Electric Supply Co., Ltd., possesses certain bulk supply powers under its Acts for parts of South Bucks—both shaded and unshaded.

Since this map was prepared by the Ordnance Survey Department in 1917, two new Urban Districts have been created, *viz.*, Wolverton and Burton Latimer.

It should also be noted that Hedsor Parish is now in Wycombe Rural District, and Wendover Parish has been transferred to Aylesbury Rural District; and a small part of the parish of Eton Wick has been transferred to Eton Urban District. Except for the above alterations, the map is topographically up to date in all respects. With the aid of such a map, the area entrusted to any particular undertaker can be readily traced out from a description of the area in words, except where the boundary line does not follow the various local government boundaries shown on the map, which is not very often the case. When all such areas have been shaded over, the areas that remain unoccupied can be readily described from the map, and any particulars regarding them that may be required can be ascertained from the census or other official publications.

It has been estimated that the possible number of consumers in the whole of the area shown on the map is well over 200,000, whereas the present number of consumers probably does not much exceed 20,000.

The above estimate of 200,000 is based on the figures given in the 1921 census, which shows the number of resident families to be over 190,000. In addition, in Table 10 of the Census the number of buildings not containing dwellings is given as over 10,000. These buildings include such places as offices, factories, warehouses, workshops, places of worship, and places of amusement.

In dealing with the areas of the various authorised undertakers, it is very important to be able to ascertain the relation in position and extent of undertaker A's area to undertaker B's area, &c. For this purpose it would be necessary to use a map of the whole country in order to make a complete survey of the situation. As such a map reproduced in our pages would be on too small a scale to be of practical use, it is proposed to deal with the respective counties on the largest practicable scale. The unoccupied areas are shown unshaded; those which are hatched are covered by statutory powers either granted or applied for (in the latter case, of course, the powers may be withheld).

The following details with regard to the existing undertakers have been extracted from the Electricity Commissioners' Returns:—

Luton.—Arrangements for mutual assistance have been entered into by Luton Corporation and the North Metropolitan Electric Power Supply Company, under Section 19 of the Electricity (Supply) Act, 1919; approved August 25th, 1922.

Uxbridge and District Electric Supply Co., Ltd.—Arrangements for mutual assistance have been entered into by the Uxbridge Company and the Metropolitan Electric Supply Co., Ltd., under Section 19; approved November 22nd, 1923.

Northampton Electric Light and Power Co., Ltd.—Arrangements for mutual assistance have been entered into by the Northampton, Wellingborough, and Rushden and District Companies, under Section 19. Also the Northampton Company has been authorised by the Northampton, Wellingborough and Rushden Electricity (Bulk Supply) Special Order, 1922, to break up certain streets outside the respective areas of supply of the three companies.

Engineering and financial data relating to the authorised undertakers mentioned above can be obtained from the Electricity Commissioners' Return—"Electricity Supply"—published in June, 1925.

Electricity Supply in the Counties of Bedfordshire, Buckinghamshire, and Northamptonshire.

Practical Nomography.

How to Make and Use Nomograms.

By REGINALD O. KAPP, B.Sc., A.M.I.E.E.

The graphical representation of a law, known as a nomogram or alignment chart, is fascinating. The connection between the lines and scales on the chart and the often complicated mathematical concepts represented is so far from obvious that such charts must appear astonishing to the uninitiated and not far short of black magic to the non-mathematician. One might think that great ingenuity was required to devise a graph which would correctly interpret a mathematical formula involving a diversity of functions of several variables. And yet the geometry on which this branch of graphical representation is based is quite elementary.

It is possibly the apparent difficulties of the subject that have prevented this aid to practical engineering from being more universally employed, although it was invented by M. d'Ocaigne many years ago.

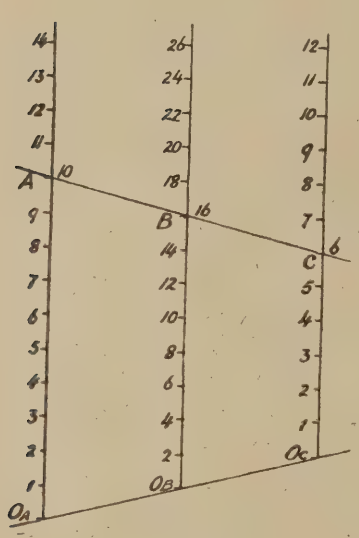

Fig. 1.

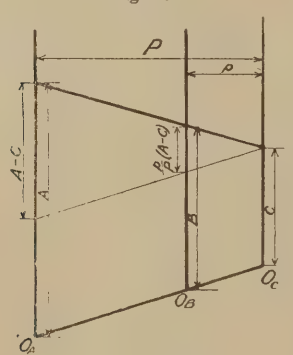

Fig. 2.

Parallel Straight Lines.

The three parallel lines in fig. 1 are equally spaced and therefore: $O_A A + O_C C = 2 O_B B$, wherever the straight line A B C is placed.

If scales are drawn on the three lines the zero point of each being at O_A, O_B, O_C respectively, and if the scale divisions on the B line are placed at half the distance from each other to those on the other two lines, and if O_A, O_B, O_C all lie on one straight line, then any straight line must cut the three lines at such scale divisions A B and C that we can read off the diagram scale divisions to solve the equation:

$$A + C = B, \text{ or put in another form,}$$
$$A - B + C = 0 \qquad (1)$$

Thus fig. 1 is a nomogram for the above simple formula.

The three quantities A, B and C may each be a function of one of three independent variables. In this case the scales on the A, B and C lines must be so-called functional scales. A functional scale is one on which the distance of each scale division from the zero point is proportional to the function of the variable. We *measure* a distance corresponding to the *function* of the variable and *write* against the point thus obtained the value of the variable itself. Functional scales familiar to engineers are those contained on the slide rule in which the function is the logarithm of the numbers marked on the scale. As an example, consider the expression for the moment of resistance of a rectangular beam:

$$R = bh^2/6$$

This can be written: $\log R - 2 \log h - \log b/6 = 0$.

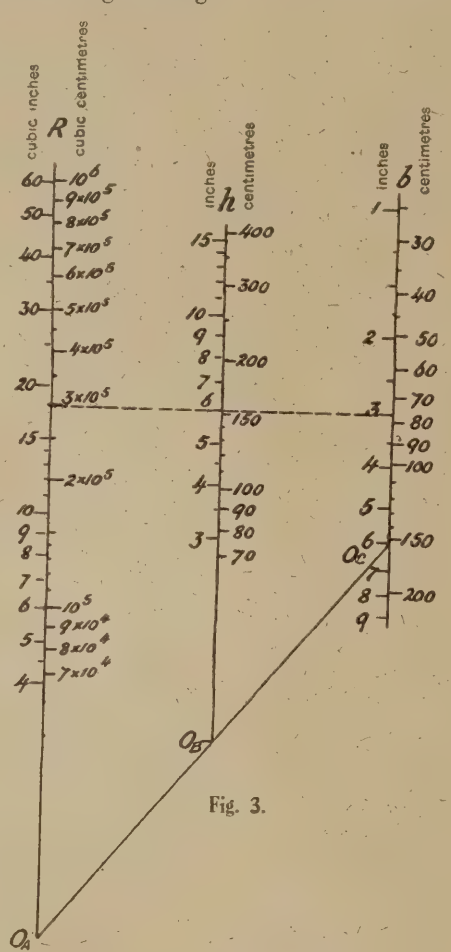

Fig. 3.

In this form the resemblance to expression (1) above becomes apparent if we write $\log R = A$, $2 \log h = B$, $-\log b/6 = C$. If we *measure* on the left hand or A line values of ($\log R$) and *write* the corresponding values of R against the measured points, making the point where $\log R = 0$ coincide with O_A, we have a functional scale of $\log R$. Similarly we can mark off a functional scale of $(-\log b/6)$ on the right hand or C line. The point for which $(-\log b/6) = 0$ must coincide with O_C. At this point $b = 6$. This is the same thing as operating a slide rule so that the 6 on the slider is opposite the 1 on the fixed portion. The 6 causes the scale to be shifted, but has no influence on the distances between scale divisions, which must be the same as on the scale of R. The function being negative, increasing values of b involve decreasing values of the function so the scale runs in the opposite direction from the scale of R. On the middle or B line we mark a functional scale of ($2 \log h$). The distance to be measured between corresponding scale divisions would be half as great on this scale as on the two outer scales if the function were $\log h$. As the function is $2 \log h$, the distance between scale markings is the same on the middle scale of h as it is on the two outer scales. The point at which $2 \log h = 0$ or $h = 1$ must coincide with point O_B.

It suffices now to choose the slope of the line O_A, O_B, O_C so that the useful values of R, h and b lie conveniently on our paper. Suppose we wish to construct a chart for cases where h varies between 3 in. and 15 in. and b varies between 1 in. and 9 in. Our tie line O_A, O_B, O_C must slope rather steeply as shown in fig. 3. To avoid this difficulty we can choose some other example as a tie line corresponding to more useful values of our variables. Such an alternative tie line is shown dotted in fig. 3, and if this is used, there is no need to extend the scales to their zero points.

It is useful that each line has two sides to it so that one side can be used for one kind of unit and the other side for another kind of unit. Thus fig. 3 has been constructed in inches, but corresponding values in cm. have been added on one side of each line. When this is done a nomogram may save a great deal of arithmetic in the conversion of units.

Figs. 1 and 3 show the correct type for any expression containing three independent variables which can be got into the form of equation 1. One variable must occur only in A, another variable only in B, and the third variable only in C. In each case the function of the variable may be simple or complicated; the chart will always have the same simple form.

A large number of expressions involve only multiplication and division of the variables or simple powers of them, and all these are easily got into the form of equation 1 by taking logs, and the graphs will contain simple logarithmic scales. Every engineer carries at least two logarithmic scales about with him, unit length being exactly half as much on one as on the other. These

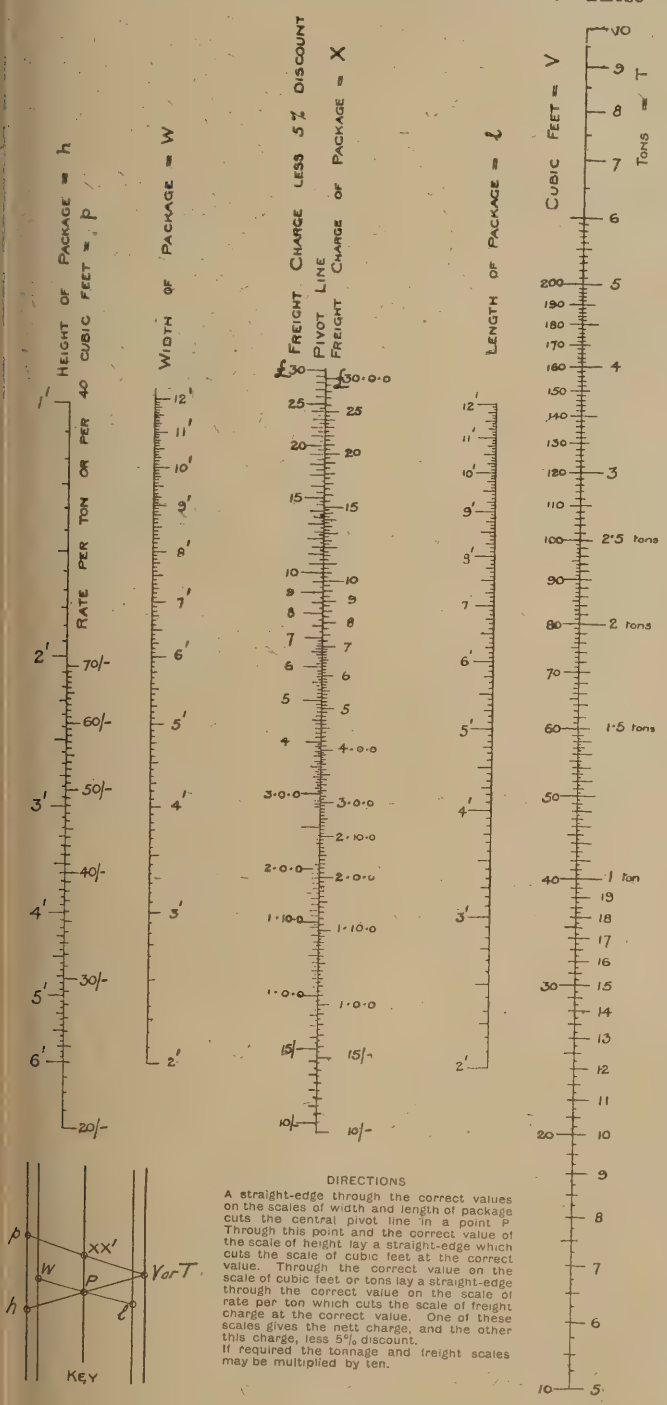

Fig. 4.—Nomogram for Freight Charges.

are the long and the short scales on his slide rule, and these suffice for a great number of graphs. In fig. 3 only one of these scales is needed.

A rule is useful to decide whether increasing values of the function are to be plotted upwards or downwards. A glance at equation 1 gives the rule. For this equation increasing values of all the three functions are measured in the same direction, and the sign of each term is opposite to the sign of the terms next to it. So we may say that *if two successive terms are of opposite signs, the scales are measured in the same direction; if two successive terms are of the same sign, the scales are measured in opposite directions.*

Unequal Spacing of Lines.

We have so far only considered cases where the three parallel lines are equally spaced. If they are not equally spaced and the distance of the B line from the C line is p and the distance between the A and C lines is P, fig. 2 shows that—

$$B = C + p/P \times (A - C).$$

It will be easily found that—

$$A - B \times P/p + (P/p - 1)\ C = 0 \quad \ldots\ldots\ldots\ldots\ldots\ldots (2)$$

This means that the scale divisions must be so spaced that if unit length represents one unit of the function A, p/P unit lengths will represent one unit of function B, and $p/(P-p)$ unit lengths will represent one unit of function C.

Unequal spacing is useful in exceptional cases; for instance, if the expression to be represented contains various higher powers of the variables, particularly if these differ by one. It may then be possible to use the same logarithmic scale for all three lines. Unless there are good reasons for it, unequal spacing should be avoided. A nomogram in which the spacing of the lines and the choice of unit length on the scales are arbitrary is needlessly tedious to construct, and looks amateurish when finished. It suggests that the designer set about his task with no clear idea of what he was doing. *When the scales are logarithmic, the advantage of being able to use the available scales on the slide rule should never be lost sight of.*

More than Three Variables.

So far we have only considered expressions containing three independent variables. For the case involving more variables, we will choose as an example the calculation of freight charges from the weight and dimensions of a packing case.

The cubic contents of the three dimensions denoting length, height and width are:—

$$\text{cubic feet} = V = h \times l \times w$$

$$\text{or } \log V - \log h - \log l - \log w = 0,$$

which can be arranged in some convenient way so that any two terms are on one side of the equation sign and are equated to a value which we will call K. For instance—

$$\log V - \log h = \log l + \log w = K$$

so that we get two separate equations—

$$-\log h - K + \log V = 0$$

$$\log w - K + \log l = 0.$$

Each of these expressions can form a separate chart for three variables. If we elect to make the scale run upwards for increasing values of a positive function, the scale of h must run downwards. Applying our rule, the scale of K must run upwards, as the sign is the same as that of the function of h. As the sign of the last term is opposite to the sign of the K term, the scales of these two run the same way so that the V scale must run upwards. The long scale of the slide rule can be used for both h and V. As we are not interested in the values of K, it is not necessary to write any figures on this scale. A blank line suffices. For the second chart, the scale of w runs upwards, that of K also runs upwards as before, and that of l must run upwards. If the choice of unit length on all scales is consistent, which holds in this case if the same slide rule scale is used for each, we can superimpose the two K lines. The single K line thus formed is called a pivot line.

The charge for a given package

$$X = p \times V/40$$

if p is the charge for 40 cb. ft. or one shipping ton.

This can be written—

$$\log (p/40) - \log X + \log (V) = 0$$

Applying our convention, all the scales increase upwards, and as the scale of V previously found also increased upwards, the new nomogram can be superimposed on the one giving V so that the values for V coincide. The same slide rule scale can be used again. To reduce the number of lines, the distances should be so chosen that the X line coincides with the K line already constructed, and we get a complete chart as in fig. 4. A second scale on the V line gives shipping tons corresponding to volume and a second scale on X gives costs where 5 per cent. discount is allowed. A glance at a

slide rule will make it clear that this second scale of x is the first scale moved so that the .95 mark on one comes opposite the unity mark on the other.

Charts with Slanting Lines.

We now come to consider another type of alignment chart based on equally simple but somewhat different geometry.

On fig. 5 we have the relationship $A/B=p/q$. The apex of the two similar triangles can have any position on the line O_A, O_B, giving different values of p/q. Put $p/q=C$ and we can write values of C along line O_A, O_B. We have then a chart solving the expression

$$A/B=C \quad \ldots\ldots(3)$$

and as before A, B and C may be any function of three independent variables, and the scales A and B functional scales. C is also a functional scale, but of a more complicated nature. The correct points can be calculated,

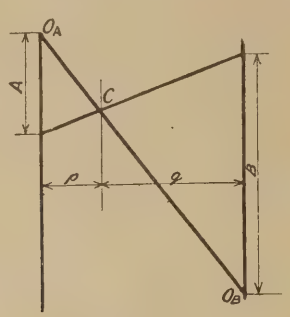

Fig. 5.

but it is generally simpler to construct all values of C point for point. Assume a convenient value of B such as 1 or 5 or 10. Then $A=C$ or $5C$ or $10C$, as the case may be. A series of lines through the selected value of B and successive points on A cuts the C line in points corresponding to easily calculated values. It will be readily seen that the same relationship holds if the values of C are placed on the C line produced beyond O_A. This gives a more extended scale of C, and is therefore sometimes of advantage.

In the simplest form of equation (3), it is better to turn the expression into the form of equation (1) by taking logs. But sometimes one of the functions is not

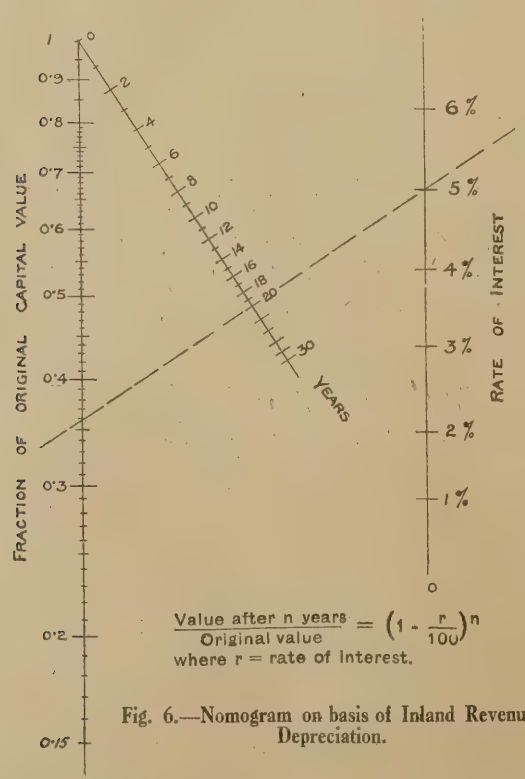

Fig. 6.—Nomogram on basis of Inland Revenue Depreciation.

suitable for simple logarithmic representation. For instance, A may be of the form $(f(a)+m)$ where m is a constant, and then the form indicated by fig. 5 is the easiest and quickest to construct. An example of this type of chart is shown on fig. 6. If p is the fraction of original capital value after n years, r the rate of interest—

$$p=(1-r/100)^n.$$

Taking logs,

$$\log p/\log(1-r/100)=n,$$

which is of the form shown in equation (3).

By taking logs a second time, a chart as given by equation (1) could be constructed instead.

(To be concluded.)

Reviews.

Alternating Currents and Transients. By F. M. Colebrook, B.Sc., &c. Pp. 195; 97 figs. London: McGraw Hill Publishing Co., Ltd. Price 15s. net.

In this volume, the author treats the theory of alternating currents by the well-known rotating-vector or symbolic method, and the book is apparently the outcome of a desire to co-ordinate the nomenclatures of pure vector analysis and the rotating-vector method of treating a.c. theory, and to simplify the interpretation of the symbolic operator j. As a matter of fact we have never found any particular difficulty in comprehending the meaning and function of j, and we do not think that the author has succeeded in making clearer what already offers little difficulty. In this treatment, the author endeavours to counteract the interpretation of the symbolic operator j as an "imaginary" quantity, and instead he pleads for the simple understanding that "the symbol j . . . rotates a vector through 90 deg. in a certain defined direction. . . ." We do not know of any other interpretation to be placed upon it!

Chapter I opens with vector definitions and proceeds immediately to introduce the operator j. The principles of vector addition and subtraction are then indicated and the study of j proceeds on more advanced lines. The author indicates the distinction to be drawn between vectors and operators, and the chapter concludes with graphical calculations employing both of these. The triangle of fig. 11 should be lettered A.B.C. in order to accord with the text, and in the line immediately below this figure, v should be av.

Chapter II treats of the scalar product of vectors, and the point of chief interest lies in the indication that transferring the operator j from one member of a scalar product to the other does not alter the magnitude of the product, but it reverses the sign. This is a useful rule to remember.

Variable vectors are dealt with in Chapter III, and the calculus is here employed for the first time in the volume.

Chapter IV enlarges upon the vector analysis of alternating currents, and very clear diagrammatic representations are given illustrating Kirchhoff's laws. The author then proceeds to a vectorial study of simple circuits containing resistance, inductance, or capacitance, and thence to compound series and parallel circuits containing more than one of these characteristics. We think it is regrettable that the author has not indicated by arrows, the assumed directions of rotation of the vector systems, and we deplore the settings of figs. 30, 31, 32, 33 and 34, the pairings of which are incongruous. We should much prefer to see the use of the word capacitance to capacity; it is more euphonious in our opinion, and in better harmony with inductance. We see that on p. 43 the author uses the conception of a "charge on the plates" of a capacitance, but we prefer Steinmetz's dictum that there is obviously no more sense in thinking of current as charging the capacitance with a quantity of electricity than of voltage as charging an inductance with a quantity of magnetism. The latter idea has been discarded long ago, so why not let the former also die a natural death? The subsequent treatment deals with inductively coupled circuits, which include transformer and a.c. bridge circuits.

Chapter V bears particularly upon the problems arising in the theory of the action of telegraph or telephone cables. The application of hyperbolic functions to the determination of current and potential distribution in telephone and telegraph cables is given, and the chapter concludes with a short treatment of stationary waves on wires.

Chapter VI includes a vectorial treatment of damped electric oscillations, and the theory of the generation of continuous oscillations by means of the thermionic valve is given. Free oscillations in magnetically coupled circuits are dealt with at greater length.

Chapter VII is concerned with the application of vector analysis to the theory of irregular a.c. waves and it very pertinently brings to the fore the fact, which is not always appreciated in practice, that if a non-sinusoidal e.m.f. wave is applied to an inductance, the current harmonics are smaller in amplitude than the corresponding pressure harmonics; the ratio of the nth current harmonic to the fundamental, for instance, is only $1/n$th of the ratio of the corresponding e.m.f. terms. In the case of capacitance, however, the opposite is the case and the current harmonics are greater in amplitude than the corresponding pressure harmonics; the ratio of the nth current harmonic to the fundamental is n times the ratio of the corresponding e.m.f. terms. These features are of very considerable importance in the testing of high-pressure cables.

Chapter VIII studies the current and pressure relationships in unloaded and loaded three-phase star and delta connected systems. The power supplied by three-phase systems and the three-wattmeter and two-wattmeter methods of power measurement are discussed. The two-wattmeter method of determining the power factor of a balanced three-wire star connected load is given, and a brief reference to the general theory of symmetrical polyphase systems of e.m.f.'s of any wave form concludes the chapter.

The usual series of examples and answers is given after each chapter for the benefit of students.

The author generously gives a bibliography of twenty-four publications dealing with the subject matter of his book, which those interested will recognise as containing most of the best and really useful works upon the subjects.

The illustrations are excellently clear and well reproduced, and the general make-up of the volume is a credit to the lishers. A useful summary of contents is given at the front of the volume and a subject-matter index at the end.

We think the title of the work might have been chosen more carefully, as far too little attention has been given to the study of transients to warrant the inclusion of that term in the descriptive sense adopted.

The Induction Motor. By H. Vickers. Pp. ix+332; figs. 151. London: Sir I. Pitman & Sons, Ltd. Price 21s. net.

At the present day it cannot be expected that any new book on the induction motor can bring with it a large amount of new matter; and in the preface the author admits that "he is deeply conscious of his great debt to various writers." Indeed, it would not be too much to say that the free use that has been made of the writings of such authorities as Steinmetz, Walker, Kloss, Smith, and others, gives to the book much of its utility. In addition, Dr. Vickers has the advantage of personal experience in the design of induction motors. The book thus represents a useful compendium of present knowledge and practice on the theory and calculation of induction motors. The subject matter is somewhat wider than the mere title implies, but the treatment is often scanty.

With all deference to American writers, we do not like the expression of torque in synchronous watts. In our opinion the author has not in the first chapter carried out his claim in the preface to have rendered due acknowledgment to sources upon which he has drawn, while some diagrams have not been copied correctly. The cross-field method has been chosen in preference to the rotary-field method in the treatment of the single-phase induction motor. Chapter III is headed "Starting devices for single-phase motors"; but after two pages the author makes a startling digression into the action of the induction generator, while the tail-end of the latter subject appears to have monopolised the succeeding chapter. Credit can be given to the author for his work in the chapter on electric braking.

The induction motor as phase converter deserves more than the two pages it receives. Speed control is treated at great length—in particular the rheostatic and pole-changing methods. The author's close connection with Mr. Hunt may serve to explain the long account of the motor bearing this name, but we are surprised to find that so little has been made by him of the ingenious device due to Mr. Creedy, wherein the speed change is effected by altering the number of phases.

As is to be expected, phase advancing and the induction-type synchronous motor find a place in a modern treatise on the induction motor, but we could have wished that they had received less cursory treatment. Windings are dealt with satisfactorily in a modern manner, though the three coloured plates referred to appear for some unexplained reason in the middle of the chapter on starting devices. The remaining chapters devoted to design should prove of value to the student.

Greater care should have been spent on the revision of the proofs, while some of the German references would defy even experts at solving puzzles.

Telephone Communication. By Charles Allen Wright and Albert Frederick Puckstein. Pp. xviii+515; figs. 294. London: McGraw-Hill Publishing Co., Ltd. Price 25s. net.

This volume is mainly devoted to telephone communication at what the authors call medium-frequency, in order to distinguish it from wire telegraphy and radio telephony, the frequencies of which lie outside. This medium band of frequencies lies within the limits of 50 and 6,000 cycles per second. Principally, however, the work deals with the causes that produce attenuation and distortion of speech, and the means of minimising them.

The work is sub-divided into four parts, dealing respectively with (*a*) The general discussion of the telephone problem; (*b*) Telephone apparatus and lines; (*c*) Recent developments in telephone communication, and (*d*) The maintenance of telephone plant. These are followed by an appendix on the electrical fundamentals which apply directly to medium-frequency apparatus and lines.

Much of the ground covered by this work has already been fully treated in several English manuals, but the reader who is particularly interested in the mathematical treatment of telephone problems will find here all the essential material required to enable him to calculate those quantities which enter into the phenomena of telephone transmission. The practical side of telephony receives a fair amount of attention, *e.g.*, the construction of loading coils, relays, cables, valves, &c., &c.

The chapters on multiplex or carrier-current telephony and radio-telephony are up to date, but the Austin-Cohen formula for the received radio current must be accepted with reserve in view of recent experiments in this direction.

Under "Maintenance of Apparatus and Circuits," simple tests for resistance and the localisation of faults are given and these are followed by descriptions of methods for the measurement of alternating currents, potentials, frequencies, phase shifts, and attenuation.

It is a pity that the authors dismiss so important a machine as the Franke alternator in the brief space of eleven lines in view of its importance in alternating current measurements. A diagram showing its principle, and a somewhat more extended treatment of its operation, would be distinctly useful.

The chapter on "Electrical Fundamentals" is a convenient summary of the various formulæ met with in electro-technics, followed by a brief explanation of vectors and hyperbolic functions.

Each chapter is followed by sets of questions and problems, as also by a bibliography of books which it is recommended should be read in connection therewith. A series of laboratory exercises forms a final appendix.

Although an American manual, having its distinctive transatlantic expressions, the British reader will find much useful information within its pages.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities New Publicity Literature, Liquidations and Failures.

A Shopping Week.—In connection with Dewsbury shopping week, which opened on October 3rd, the Electricity Committee of the Corporation supplied illuminated signs for the Town Hall; tramway standards and electric street lamps were decorated; and the Yorkshire (Woollen District) Tramways Company and the Ossett & Soothill Nether Tramways Company each supplied a decorated and brilliantly illuminated tramcar for touring the surrounding districts to advertise the "week."

E.D.A. Activities.—On Saturday last about 60 newspapers in all parts of the country contained an apposite advertisement drawn up by the British Electrical Development Association drawing attention to the end of "Summer time" and the approach of the lighting and heating season. The keynote of the advertisement was "Light, warmth, and comfort in one word—Electricity."

An "Exide" Window-dressing Competition.—A window-dressing competition in connection with "Exide" batteries was recently organised by the Chloride Electrical Storage Co., Ltd., and over 1,400 entries were received. The judges, who were editors of the automobile and radio Press, awarded the first prize (20 guineas) to the Negus Electrical Co., Cambridge. The second (10 guineas) and third (5 guineas) prizes were awarded to Mann, Egerton & Co., Ltd., Norwich, and J. Tee and Co., East Finchley, respectively.

Window-lighting Competition.—Messrs. W. P. Holt and Co., electrical contractors, Bradford, are to be congratulated on the fact that the electrical installations at the shops of Madame Eda (modiste), Bridge Street, and Mr. J. Walton (confectioner), Victoria Square, which won the first prizes in two sections of the window-lighting competition in the recent Bradford Shopping Week, were put in by them twelve months ago, and were not altered in any way for the competition.

Works Visit.—Last month a party of members of the East Kent branch of the Electrical Contractors' Association paid a visit to the Cosmos Lamp Works (Metro-Vick Supplies, Ltd.), Brimsdown. The journey was made by charabanc and upon the return a break was made to allow the party to inspect the company's London showrooms.

Catalogues Wanted for Australia.—The Australian Commonwealth Engineering Standards Association is establishing a valuable collection of trade catalogues and similar commercial material in connection with its library, which, with the very extensive library of the Institution of Engineers, Australia, is available for the use of members of both organisations. The engineer-secretary, Mr. W. R. Hebblewhite, of Macleay House, 16, College Street, Sydney, asks us to bring the matter to the notice of British manufacturers, in order that the Association may be placed on their mailing lists for the receipt of their publications.

Lead.—Messrs. James Forster & Co., in their lead market report of October 3rd, say: "Closing prices yesterday were £39 15s. for October and £37 5s. for January, a rise on the week of 30s. and 25s. respectively. Since September 21st, when the price touched £40 10s., consumers have not been much in evidence, but it was certain that, with the present acute shortage, prices would advance again when buying was renewed. The shipping strike is dislocating supplies and its effect will be felt for many months to come. On the other hand, consumption shows signs of decreasing both here and on the Continent owing to the high price, and lead is arriving in London from France, Germany and Belgium. Under present conditions the price is likely to go higher yet."

Electrical Commercial Travellers.—The following events are included in the programme of the Electrical Trades Commercial Travellers' Association, to which we briefly referred in our last issue:—

October 10th.—Bohemian Concert, Manchester Hotel, 7.30 p.m.

October 30th.—Lecture by Mr. V. Dale on "Salesmanship," at E.L.M.A. Rooms, at 7 p.m.

November 13th.—Annual General Meeting, St. Bride's Institute.

November 21st.—Whist Drive and Social, Manchester Hotel, 7.30 p.m.

January 15th, 1926.—Lecture Demonstration on "Lighting," by Mr. W. E. Bush, at E.L.M.A. Bureau, at 7 p.m.

February 13th.—First Annual Dinner, Manchester Hotel, 6.30 p.m.

March 20th.—Grand Carnival Dance, Manchester Hotel, 7.30 p.m.

For Sale.—Lincoln Corporation Electricity Committee invites offers for one 750-kW Willans-Westinghouse turbo-alternator and exciter, also a quantity of steam valves. Mr. H. J. Shaw will sell by auction on October 27th, at 85, Newington Causeway, a stock of electrical and wireless goods, &c. (See our advertisement pages to-day.)

Trade Announcements.—The Macintosh Cable Co., Ltd., have moved to larger premises at 241a, West George Street, Glasgow. Telephone No.: "Central 7278"; Telegrams: "Cablamac."

The telephone numbers of Messrs. Everett, Edgcumbe and Co., Ltd., Colindale Works, Hendon, have been altered to "Colindale 6045 and 6046." The firm's London office telephone numbers will remain unaltered, *viz.*: "Victoria 3020 and 3021."

Iron & Nickel Battery Co., Ltd., have removed to 17-19, Cockspur Street, Pall Mall, S.W. Telephone: Regent 7187.

Runbaken Magneto & Accessory Co. state that all communications, parcels, &c., intended for the Runbaken Magneto Co., Ltd., should be addressed to 270, Deansgate, Manchester, and not elsewhere, as their former branch depôts have been closed down.

On September 30th Mr. M. W. Woods removed his London offices and showrooms to larger premises at 3, Denman Street, London Bridge, S.E.1. Telephone number: Hop 6966/7.

Mr. J. Carman, electrician and wireless engineer, of 65, King Street, Ramsgate, is opening a branch business at Broadstairs.

Mr. J. E. Dawson, radio engineer, has opened new showroom premises in High Street, Boston.

Messrs. S. Evans & Sons, electrical and wireless specialists, have opened premises at 16a and 18, King Street, Maidenhead.

Catalogues and Lists.—Mr. F. Turner, 61-63, Summer Hill, Birmingham.—An illustrated leaflet containing details and prices of art metal fire surrounds, curbs, &c.

Marconi's Wireless Telegraph Co., Ltd., Marconi House, Strand, W.C.2.—Leaflet No. 1052, containing an illustrated description of the company's 100-W "Type Q" broadcast transmitting equipment.

Messrs. Crompton & Co., Ltd., Chelmsford.—Descriptive List No. 607, dealing with auto-synchronous motors and their applications, particularly in the improvement of power factor.

Brookhirst Switchgear, Ltd., Northgate Works, Chester.—Calendar cards for October, November and December, bearing views of Chester.

The British Thomson-Houston Co., Ltd., Mazda House, Newman Street, Oxford Street, W.1.—An illustrated pamphlet dealing with the "Trojanette" kitchen-lighting unit, and a blotter advertising "Mazda" lamps.

Mr. O. N. Beck, 11, Queen Victoria Street, E.C.4.—An illustrated pamphlet describing the "Opifex" water-level communicator for boilers.

Metropolitan-Vickers Electrical Co., Ltd., Trafford Park, Manchester.—Leaflets Nos. 18/1-1, describing the company's d.c. mill motors; and 17/1-1A and 17/1-1D, dealing with the "X" type d.c. commutating-pole motor. Fully illustrated.

Metro-Vick Supplies, Ltd., Trafford Park, Manchester.—A series of illustrated pamphlets dealing with the "Cosmos" three- and five-valve sets, crystal set, and valves.

The Mulford Wireless Service Co., Ltd., Nightingale Lane, Balham, S.W.12.—A showcard indicating which of the radio valves on the market possess similar characteristics. Also an identification "tally" for the use of those who charge accumulators in quantity.

Rotocrete, Ltd., 11 and 12, Windsor House, Victoria Street, S.W.1.—Three pamphlets describing the "Rotocrete" beam system of building construction.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—A pamphlet entitled "The Secret of Better Home Lighting," describing the company's domestic lighting fittings and lamps. The "Osram Bulletin" for October, advertising "Osram" lamps and valves.

The Cambridge Instrument Co., Ltd., 45, Grosvenor Place, S.W.1.—An illustrated postcard depicting CO_2 and CO content measuring instruments.

Attaix, Ltd., 36, Bernard Street, Southampton.—Two leaflets illustrating and describing the "Chargeless" high-low tension supplier and the "Adaptolite" four-valve wireless set.

Mr. W. S. Johnson, 42, George Street (first floor), Edinburgh.—A leaflet illustrating and describing a cordless electric iron.

Messrs. Alan Wright, Sentinel House, Southampton Row, W.C.1.—An illustrated and priced folder advertising "Inventum" electric fires.

Tungstalite, Ltd., 47, Farringdon Road, E.C.1.—An illustrated folder dealing with "Tungstalite" lamps, and a price list of cables, conduit, lampholders, switches, &c.

Igranic Electric Co., Ltd., 149, Queen Victoria Street, E.C.4.—An illustrated pamphlet describing the "Igranic" supersonic heterodyne receiver outfit, and a priced leaflet of component parts for radio purposes.

Messrs. Simpson, Baker & Co., 2-5, Nelson Street, Bristol.—A booklet showing radio receiving sets, loud speakers, valves, and other component parts. Illustrated and priced.

Messrs. Etablissements Merlin et Gerin, Grenoble, France.—An illustrated catalogue, describing various types of transformer pillars for tapping overhead high-pressure transmission lines.

Messrs. Hunter & Jack, 38, Elliot Street, Cranstonhill, Glasgow.—A price list of "B.I." lamps.

Swedish General Electric, Ltd., 5, Chancery Lane, W.C.2.—Stock list No. 116, containing particulars and prices of a.c. motors and d.c. motors and generators available for immediate delivery. Also pamphlet No. 102, dealing with motors and machinery for the printing trade.

The Jackson Electric Stove Co., Ltd., 143, Sloane Street, S.W.1.—October blotter bearing an illustration of the "No. 586" fire.

Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—A leaflet bearing illustrations of the showcards, signs, posters, &c., produced in connection with the company's lighting "campaign." Also monthly price list for October.

Messrs. Cole, Marchent & Morley, Ltd., Bradford.—An illustrated pamphlet describing the company's heat-extraction steam engines.

Messrs. Birkbys, Liversedge, Yorks.—A mailing card showing a transformer tapping switch for 200 A at 50,000 V (max.), moulded in "Elo" insulating material.

Messrs. J. Hopkinson & Co., Ltd., Britannia Works, Huddersfield.—Illustrated list (No. 1850) particularising their "Mac" valves.

Messrs. Higgs Motors, Witton, Birmingham.—October stock list of motors, announcing a.c. price reductions.

Messrs. Herbert Morris, Ltd., Loughborough.—32-page illustrated pamphlet relating to their hand overhead cranes.

Messrs. Tok Switches, Ltd., Granville House, Arundel Street, London, W.C.2.—Blotter for October.

Bankruptcy Proceedings.—F. A. Fraser, electrical engineer, 33, Tothill Street, Westminster, S.W.1.—This debtor attended on September 29th before Mr. Registrar Francke, at the London Bankruptcy Court, for public examination upon accounts showing unsecured debts of £806; a partly secured debt £2,500 (security valued at £800), assets "nil," and a deficiency estimated at £2,506. Replying to Mr. Vyvyan, Assistant Official Receiver, the debtor stated that in addition to being an electrical engineer he had acted as director to several limited companies. Among the number was the Electrical Contract and Maintenance Co., Ltd.; that concern went into liquidation in 1924, but was succeeded by the Electrical Contract and Maintenance Company (1925), Ltd., which was still in existence. Whilst a director of the old company he guaranteed an advertising account owing to Messrs. Sells, Ltd., who had obtained judgment against the company for £326; they agreed to refrain from proceeding under the judgment in consideration of witness guaranteeing the payment; a sum of £150 was paid before the company went into liquidation, but Sells, Ltd., thereupon proceeded against witness for the balance, obtained judgment for £186, and instituted bankruptcy proceedings. At the time of giving this guarantee witness held 2,000 shares in the company. In October, 1919, he assisted in the formation of R.J. Corporation, to which Messrs. Cox, the bankers, advanced £13,000 on the security of debentures and the joint and several guarantees of the four directors. That company went into liquidation in 1921; Messrs. Cox realised £3,000 in respect of the debt, and the four directors became responsible for £2,000 each in respect of the balance. Witness had returned his guarantee as the partly secured debt of £2,500, the security being a reversion which he had valued at £800. The debtor attributed his insolvency to the failure of companies in which he had been interested and to his liability under the before-mentioned guarantees. The examination was concluded.

W. J. Lattimer (Lattimer & Co.), electrical engineer, 52, High Street, Croydon.—Receiving order made September 24th, on creditor's petition. First meeting October 14th, at 29, Russell Square, W.C. Public examination November 23rd, at the County Court, Croydon.

J. S. McLeod (McLeod Bros.), radio and electrical engineer, 189, Blackburn Road, Bolton, and also with a partner as

McLeod Bros., at 55, Chorley New Road, Horwich.—First and final dividend of 3s. 10½d. in the £, payable at the offices of Messrs. H. L. Price & Co., 47, Mosley Street, Manchester.

C. Wright and H. T. Wright, electrical engineers, 251, Fulham Road, S.W.—Trustee, Mr. W. Strachan, 50, Gresham Street, E.C., released August 25th.

S. H. Bardwell (Bennett, Bardwell & Co.), electrical engineer, 22, Church Street, Basingstoke.—Receiving order made September 24th, on debtor's own petition.

T. Roberts and J. Taylor (Roberts & Co.), electrical engineers, 61, Old Town Street, Plymouth, and Fore Street, East Looe.—Trustee, Mr. F. West, appointed September 26th.

J. Isherwood, wireless and photographic dealer, 91, Lee Lane, Horwich.—First and final dividend of 2¾d. in the £, payable at the Official Receiver's offices, Byrom Street, Manchester.

J. B. Shields, plumber and electrician, 221 & 198a, Linthorpe Road, Middlesbrough.—First and final dividend of 1s. 5d. in the £, payable October 13th, at 55-57, Albert Road, Middlesbrough.

F. Mitchell and J. Mitchell (separate estates), electrical engineers, lately carrying on business under the style of F. Mitchell & Co., 97, Stockport Road, Ardwick, and 58, Ashton Old Road, Openshaw, Manchester.—Last day for proofs for dividend, October 14th. Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester.

F. J. North, electrical engineer, 13a, Midland Road, Wellingborough.—First and final dividend of 2d. in the £, payable at the Official Receiver's office, The Parade, Northampton.

A. Thompson (Arnold Electrical Co.), electrical and mechanical engineer, 38, Lucy Street, Hulme, Manchester.—Last day for proofs for dividend October 17th. Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester.

Dissolutions of Partnership.—Electro-Factors, electrical factors, 4, Oxford Mews, W.2.—Mr. E. A. Pye and Mr. F. J. Whaten have dissolved partnership. Debts will be attended to by Mr. Pye, who will continue the business under the same style.

Hone & Stammers, electrical engineers and wireless contractors, 46, Malden Road, New Malden.—Mr. B. F. Stammers and Mr. H. P. G. Hone have dissolved partnership. Mr. Stammers will attend to debts.

Company Liquidations.—Will Smith, Ltd., electrical engineers, 281, West Derby Road, Liverpool.—An adjourned meeting of creditors was held recently. At the statutory meeting held previously a statement of affairs was submitted which disclosed liabilities of £2,028, and net assets of £43, leaving a deficiency as regarded the creditors of £1,985. The meeting was adjourned to enable the debenture holder to be asked to withdraw her claim in favour of the unsecured creditors. This, however, she was not prepared to do, and the adjourned meeting eventually broke up without any resolutions being passed; the matter will therefore remain with the present liquidator.

C. F. Hendrick & Co., Ltd., loud speaker manufacturers, 10, Berwick Street, Victoria, S.W.1.—A meeting of creditors was held on September 28th, when the chair was occupied by Mr. H. R. Gothard, C.A., 8, Laurence Pountney Hill, E.C., who stated that he had been appointed to act as the liquidator in the voluntary liquidation of the company. The statement of affairs presented disclosed liabilities of £507, and net assets of £16, leaving a deficiency of £491, subject to the costs of liquidation. Mr. Gothard reported that in addition to the liabilities shown on the statement of affairs there was a certain amount due to directors. The company was formed on September 4th, 1924, with a nominal capital of 3,000 shares of £1 each. It was stated that 750 shares were allotted to Mr. Hendrick as consideration for the purchase of an invention. In addition 1,502 shares were taken up for cash. No sales had taken place at all. The stock was mostly partly finished and if sold by auction would not fetch more than £50. Mr. Gothard added that there was every possibility of a reconstruction and in that case the creditors would be paid in full. It was decided to confirm the voluntary liquidation of the company with Mr. Gothard as liquidator. The following are creditors :—

	£		£
New Synergy Co.	22	Wandsworth Die Casting Co.,	
Solidite Mfg. Co., Ltd.	24	Ltd.	40

Deeds of Assignment.—W. Wilson (J. Rattray & Son), plumber and electrical engineer, 293, Great Western Road, and 1, Westbourne Terrace, Glasgow.—Particulars of claims to be forwarded immediately to the trustee, Mr. J. McNicol, 59, Bath Street, Glasgow.

J. A. H. Halifax, electrical engineer, 24, Duckworth Grove, and 5, City Road, Bradford.—Particulars of claims by October 28th to the Trustee, Mr. J. E. Turner, 2, Piccadilly, Bradford.

Private Arrangements.—Charles Gates, Ltd., electrical engineers and wireless dealers, Norwich.—A conference of the creditors of the above was held on October 2nd, at the Royal Hotel, Norwich, when the representative of the bank, who were creditors for £585, was elected to the chair. The statement presented disclosed liabilities of £3,468, whilst the assets were estimated to realise £1,707. From the latter amount had to be deducted £131 for preferential claims, leaving net assets of £1,575, or a deficiency of £1,892. It was stated that the claims of the trade creditors totalled £2,882. The company was registered in March, 1924, with a nominal capital of £2,000, of which approximately £1,100 had been issued. There were two directors, and the accountants reported that during the twelve months to March last the turnover was in the neighbourhood of £9,000. The gross profit earned had been insufficient, having regard to the working and overhead expenses. It was further stated that the accountants had been investigating the matter on behalf of a client, who was contemplating finding capital for the business. It was possible that something like £1,000 would be found for the company. After discussing the position, it was decided to appoint a committee to consider the matter, and to deal with any offer which might be received. The committee consisted of the representatives of the Cable & Electric Accessories Co., Burndept., Ltd., Chloride Electrical Storage Co., the Hart Accumulator Co., and one local creditor.

The Institution of Rubber Industry.—At the annual general meeting of the London and District Section, on September 28th, Mr. D. A. S. Porteous (Messrs. Johnson and Phillips, Ltd.), was elected chairman, and Mr. S. C. Mote (India Rubber, Gutta Percha and Telegraph Works Co., Ltd.), as vice-chairman. Dr. T. J. Drakeley (Head of Department of Chemistry and Rubber Technology, Northern Polytechnic Institute), was re-elected hon. secretary. Dr. Drakeley stated that 180 new individual members had joined the Institution during the previous week. Members of the Section are paying a visit to the laboratories of the Netherland Government Rubber Institute, at Delft, Holland, at the invitation of Dr. A. van Rossem (Director of the Institute). They were to leave London last night (Thursday), October 8th, and return by Sunday morning next. On Monday last at a meeting held at the Engineers' Club, Sir Chas. Higham read a paper on "Collective Advertising."

Book Notices.—"Arctic and Western Hudson Bay Drainage (and Mississippi Drainage in Canada) in Alberta, Saskatchewan, Manitoba, and Western Ontario, Climatic Year 1922-23." (Pp. 234 and map.) Ottawa: F. A. Acland (Government printer).—This publication is a mass of detailed information regarding stream measurement and similar matters, compiled by the Dominion Water Power Branch, Department of the Interior.

"Faraday House Journal." Vol. XI, No. 4. London: Faraday House.—The Michaelmas term issue, besides the usual notes and notices, contains an article entitled "A Three-phase Balanced Load Wattmeter," and another on "The Pressure Testing of Cable Lines with D.C." It is satisfactory to note the long list of appointments secured by Faradians, and the official "blazer" badge of the College is illustrated.

"On the Road," by W. H. Beable. 115 pp. London: Simpkin, Marshall, Hamilton, Kent & Co. Price 5s. net.

"The Confessions of a Capitalist," by Sir E. J. P. Benn, Bart. Pp. vii+287. London: Hutchinson & Co. Price 18s. net.

"Modern Picture Theatre Electrical Equipment and Projection," by R. V. Johnson. Pp. xii+170; figs. 79. London: Crosby, Lockwood & Son. 15s. net.

"Modern Advertising," an authoritative guide to the use of every form of present-day publicity (to be completed in 20 fortnightly parts). Part I. London: Sir Isaac Pitman and Sons, Ltd. Price 2s. each part.

"Circular of the United States Bureau of Standards."—No. 276, Motor-Vehicle Headlighting. Price, 20 cents.

Local Exhibitions.—Scunthorpe and Frodingham.—An electrical exhibition was opened on September 28th by the chairman of the municipal Electricity Committee (Mr. Donald Munro) at the Central Auction Rooms. The show remained open for the rest of the week.

Nottingham.—The electrical exhibition organised by the Nottingham branch of the Electrical Contractors' Association was to be opened yesterday (Thursday). The exhibition has the support of the Corporation Electricity Department, and sixteen members of the Association have erected stands. The result is a very comprehensive demonstration of electricity in service, the arrangements having been made under the supervision of Mr. W. A. Gillott. The Corporation's exhibit takes the form of a bungalow, each room of which is equipped with the appropriate electrical appliances.

New German Company.—With the title of the Gesellschaft fur Hochvolt Isolation a new company has lately been formed in Dresden to manufacture insulating material for very high voltages.

Large Foreign Orders.—An optimistic note is struck in *British Industries*, dated September 30th, in the publishing of a list of important orders from oversea countries secured by members of the Federation of British Industries. It is stated that one of the surest signs of a return to stability in the world's commerce and industry is the increased magnitude and number of orders for export of their products received and accepted by British engineers. Among the orders quoted are the following :—Six additional patent stokers for the Buenos Aires Central Electric Station; three Marconi radio-telegraph and telephone installations of the "YB1" type; a 3,000-line automatic telephone exchange for Fontainebleau (Paris); and the erection and equipment of an electrolytic plant in Paris.

Japanese Machinery Import Restriction.—Advices from the F.B.I. correspondent in Tokyo show that a committee of investigation consisting of Governmental and business people has been set up to study the question of reducing the importation of machinery as much as possible. The committee has been named the National Product Investigation Association, and its terms of reference include the following :—(1) To investigate the present Customs tariff in connection with the development of the Japanese electrical industry; (2) to consider the advisability of establishing a system of inspection

of Japanese-made machinery in order to improve the quality; (3) to consider the granting of subsidies; (4) the adoption of a standard rating for electrical machinery; (5) the reduction of reckless competition between makers; (6) an investigation of the possibilities for reducing imports.—*The Times Trade and Engineering Supplement.*

"Use Electricity."—The autumn number of this little quarterly booklet, which has been regularly issued by the North Metropolitan Electric Power Supply Co. to its consumers and others in its area since 1919, bears on the front cover an amusing sketch of "Mr. Switch of the North Met," whose helpfulness from morn to eve is exemplified inside. The company, which has added 2,375 premises to its connections during the first half of 1925, offers a fixed charge and low unit rate for all domestic purposes, and nearly 1,000 consumers have adopted this attractive tariff, known as the "Annual Service Rate." Two new showrooms have recently been opened, making a total of 16.

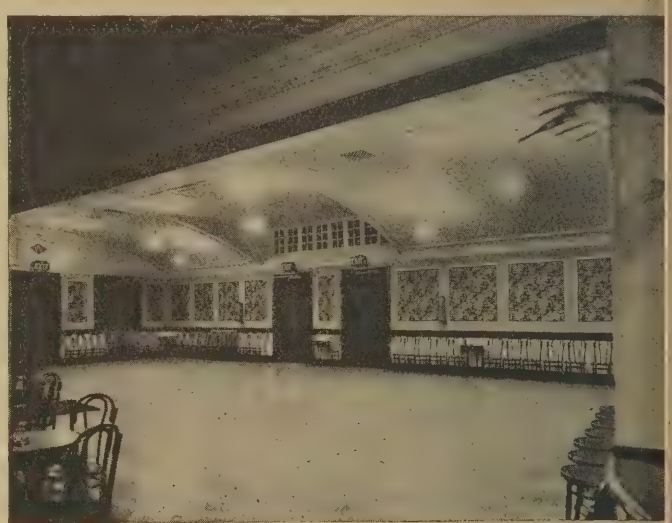
New Indian Company.—A new company has lately been formed at 2, Fairlie Place, Calcutta, with a capital of 500,000 rupees and the title of the Electric Welding and Manufacturing (India) Co.

Hackney Strike Failure.—The strike of employés at Hackney electricity works, which was to have taken place last Friday afternoon, failed to materialise. Only eight men ceased work, the others refusing to obey the strike notices, and there was no interruption in the electricity supply. Seven of the men who struck returned to work later. The dispute arose from the employment of a jointer who was not a member of the Electrical Trades Union. The 20 wiremen employed in the wiring of the Council's new showrooms, who ceased work, have been deemed by the Council to have resigned.

Trade Openings in Bulgaria.—A Sofia correspondent of the *Financial Times* says that there is, without doubt, an opening for British trade in Bulgaria, more especially in the matter of textiles and machinery. Machinery of all kinds is needed for agriculture, irrigation, electricity, and automobiles. For the first five months of the year imports from Great Britain amounted to £700,000, an increase of 50 per cent. as compared with the similar period of 1924. This shows that the trade is to be found in spite of competition from Italy, France, and Czecho-Slovakia. It is stated that British goods are recognised as the best, and the price is not so much of a difficulty as the method of paying for them.

Wage Reductions Unprofitable.—Speaking at a luncheon of the American Chamber of Commerce in London last week, Mr. E. A. Filene, a prominent American business man, said that mass production and mass distribution were the order of the day if a country was to find success. Reduced wages and longer hours would not necessarily mean cheaper or greater production. He concluded by saying:—"For the first time in history it pays to pay good wages."

Machinery for New Zealand.—The New Zealand Railway Department intends to make extensive additions to its workshops in the Dominion which will involve the purchase of very considerable quantities of up-to-date machinery. It is intended, as far as possible, to place the orders for this machinery in Great Britain. Particulars of requirements are now with the New Zealand High Commissioner in London, who is receiving many inquiries from British firms.—*The Times.*



Egyptian Government Contracts.—The *Board of Trade Journal*, dated October 1st, contained a further reminder to British manufacturers that the lists of tenderers for supplies for the Egyptian State Railways, Telegraphs and Telephones are being revised, and a new application must be made by any firm desirous of being placed on the lists. Among the materials specifically mentioned are electrical materials, lifting machinery, lighting materials, signalling material, and telegraph and telephone materials. Applications should be addressed, by October 15th, to the General Manager of the Egyptian State Railways, Telegraphs and Telephones, Cairo, and the reference 129.45/7 should be quoted.

The 1925-26 E.D.A. Conferences.—As we mentioned in our last issue, the 1925-26 series of Conferences organised by the British Electrical Development Association commences on October 15th with a demonstrated address by Mr. W. E. Bush on "Selling Better Lighting to the Shopkeeper," at the E.L.M.A. Lighting Service Bureau; the programme will be repeated on the following evening. On November 20th the *venue* will be Caxton Hall, Westminster, and a paper on "Assisted Wiring Schemes" will be read by Mr. James Edgar (South Shields); the chair will be taken by Mr. R. P. Sloan, C.B.E. A display of electrical films will be given at Australia House on December 18th. Mr. Ll. B. Atkinson, M.I.E.E., will be the principal speaker on January 15th, his subject being "Suggestions and Auto-Suggestion in Salesmanship"; the chairman will be Sir Philip Nash, K.C.M.G. Mr. Walter Riggs, A.M.I.E.E., will occupy the chair on February 19th, when Mr. G. Blair Imrie (Messrs. Imrie & Angel) will speak on "The Electrical Industry and the Architect." The final meeting will be held on March 19th; Mr. D. N. Dunlop will be in the chair and Mr. J. J. McKenna will deliver an address on "The Progress and Prospects of Commercial Electric Cookery." The last three meetings are to be held at Caxton Hall. Definite limits have been fixed for the conferences, the programme stating that they will commence at 7.30 p.m., and terminate at 9.30 p.m. The programme also says: "There are no fees. Everyone electrical cordially invited."

Radio Apparatus in South America.—In a review of the radio apparatus market in South America, *The Times Trade and Engineering Supplement* states that in Chile the United States and Germany hold the lead as suppliers, chiefly owing to price considerations, as the main demand is for the cheapest sets which will operate satisfactorily. While the buying public realises the good quality of British apparatus, prices are too high. It is estimated that the United States' share of the trade has increased from 60 per cent. in 1924 to 75 per cent. this year. At the same time, the German share has fallen from 20 to 12 per cent., and that of Great Britain from 15 to 9 per cent. In Brazil the position is better; recent figures show that Great Britain is pushing ahead, and in 1923 British exports of radio apparatus to Brazil were slightly higher than those of the United States. In dealing with Brazilian firms, it should be remembered that rather extended credit facilities are required; agents' catalogues should be in Portuguese; and advertising is very necessary. The Germans have a good hold of the electrical industry, and their commercial acuteness is shown by the German manufacturers' system of combining non-competitive agencies for marketing composite lines of electrical merchandise. The Uruguayan market is good; the United States supplies the bulk of the goods, followed by Great Britain and Germany. The ten-year concession secured by the Peruvian Broadcasting Co. opens up an assured and progressive market for radio goods in that country. Ecuador and Colombia are moderate markets, but the importation of receiving sets into Venezuela is at present prohibited.

Fire.—Early on the morning of September 29th a fire occurred in the Test Department of the British Thomson-Houston Co., Ltd., at Rugby.

The Lighting of an Assembly Hall.—The accompanying illustration is a view of the Muswell Hill Assembly Hall, a new building which has recently been illuminated throughout by Messrs. Wight & Co., Finchley. From the ceiling of the main hall are suspended three rows of "Unalux" units equipped with "White Osram" lamps. This equipment provides an even, glareless illumination. The steps of the entrance hall are illuminated by two units fitted beneath the portico, comprising special fittings with G.E.C. "Superlux" globes, and two "Unalux" units light the entrance hall. Over the serving counter of the bar two cord pendants are fitted with "Equiluxo" glassware of the distributing type. In the wine and spirit stores, immediately behind the bar, illumination is provided by special ceiling fittings with "Superlux" globes; and a single "Unalux" unit provides the general illumination of the bar. A special feature of the installation is the number of wall plugs fitted at various points round the hall, for the purpose of enabling spotlights and projectors fitted with rotary colour screens to be used. In the grounds experiments are being carried out with G.E.C. "Fairyland" strip and "Osram" colour-sprayed lamps. Floodlight projectors fitted with colour screens are also being tried, with the aim of producing decorative colour effects in the trees.

Muswell Hill Assembly Hall.

British Machinery for Russia.—M. Bogdanov, the president of the All-Russian Supreme Economic Council, who is at present in London, interviewed by a representative of the *Financial Times* recently, said that his purpose in coming to Great Britain was to become acquainted with the condition of British industries, and the possibility of placing orders for a variety of equipment and machinery in this country. "Already a million pounds' worth of equipment for the textile industry has been placed in Great Britain. Negotiations are proceeding for further quantities of machinery, as well as for ship construction, power installations, &c., but we expect to be offered acceptable terms of credit for our orders."

Electrical Equipment for Buenos Aires.—Plans for the electrical equipment of the new port of Buenos Aires have been prepared and submitted by the Director-General of Navigation and Ports to the Government. A preliminary estimate of the cost of the installation amounts to 840,000 pesos. —*Reuter's Trade Service* (Buenos Aires).

Australian Electrical Imports.—It is stated that the value of the imports of machinery into Australia during the fiscal year 1924-25 was £1,822,543 in excess of the 1923-24 figure, owing principally to the larger imports of electrical apparatus.

Indian Trade Commissioner's Address.—The *Board of Trade Journal* states that as from November 1st the address of Mr. T. M. Ainscough, C.B.E., the Senior Trade Commissioner in India, will be: Fairlie House, Fairlie Place (P.O. Box 683), Calcutta.

An Anglo-South American Association.—An Anglo-South American Association has been formed, with offices at 25, Haymarket, S.W.1, for the promotion of British trade in South America. The Association has only one object—to inform public opinion on the vital urgency of recapturing the great Latin-American markets. It has the support and co-operation of some of the most prominent business men in the country; among those who have already promised to be vice-presidents are:—Sir Godfrey Baring, Bart., Sir Trevor Dawson, Bart., Sir Robert Hadfield, and Sir Arthur Stanley, G.B.E. A circular issued by the Association says that British investments in South America amount to over £1,100,000,000. There is half a billion of money in Argentina alone; there is a quarter of a billion in Brazil. Even in the comparatively small and unexploited Venezuela we have £10,000,000, and it is significant that nearly all the latter's rich oil and mine workings have been subsidised by British money. "South America wants to trade with us more than anybody. The South American Republics have never forgotten what the British people did for them in the cause of Latin-American freedom. They would rather see our ships and traders than those of any other country in the world, and we intend to see that this fact is brought home to everybody in Britain, and particularly to our traders whose commercial interests can be directed to South America. Higher prices, due to higher wages, have not been the only reason why we have lost our South American orders. We have not shown the energy, the enterprise and the personal enthusiasm of our competitors. Informed public opinion can alter this. To-day South American markets are in effect the greatest and perhaps the only markets in the world where we can hope completely to recover our prosperity from the appalling industrial set-backs of the last 11 years. Germany has not been slow to see its possibilities, nor has the United States."

A B.T.-H. Film.—During the next few months a film produced for the British Thomson-Houston Co., Ltd., will be exhibited at many of the leading kinemas. The title is "Listeners-in," and in a skilful and ingenious manner B.T.-H. headphones are introduced at various points of a romantic story. A series of coloured showcards has also been issued in connection with the "Mazda" lighting and radio campaigns. One of these is a chart showing the voltage of lighting sets and the type of lamp cap employed on passenger automobiles, commercial vehicles, and motor-cycles of numerous makes.

Manufacturers' Tariff Campaign.—Speaking at the annual meeting of the National Union of Manufacturers last week, Mr. George Terrell (president) characterised the Safeguarding of Industries Act as a failure. He said: "The Government scheme has been in operation for nearly eight months, and so far only one industry has been able to obtain the benefit of it. Many industries dare not apply, as from the definite experience of the last few months they know that the procedure is so dilatory, so inquisitorial in character, and the results so uncertain, that they would get an abnormal dump of foreign goods in the interim, which would probably put them out of business for months to come." The Union has decided, therefore, to undertake an extensive propaganda campaign to impress upon the people of this country the need for protecting British industries. A part of the scheme is the training of 50 lecturers to present the Union's case in all parts of the country.

British Trade Mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from September 30th. In the case of foreign applications, the name and address of the British representatives are also given:—

Ledbitum. No. 461,108. Class 1. Bitumen paint. Kalvar. No. 451,110, and Kalvarfin. No. 461,000. Class 1. Varnish paint.—Callender's Cable and Construction Co., Ltd., Hamilton House, Victoria Embankment, London, E.C.4.

Ormond. No. 459,643. Class 8. Condensers, transformers, resistances, crystal detectors, all being component parts of apparatus for use in wireless telephony.—Edward Joseph L. Delfosse, trading as the Ormond Engineering Co., 199-205, Holloway Road, London, N.1.

Radio Sun (lettering and design). No. 458,398. Class 8. Apparatus for use in wireless telegraphy and telephony.—Auto Sundries, Ltd., 10a, Lower Grosvenor Place, London, S.W.1.

Radolion. No. 460,428. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Edward A. Graham, trading as Alfred Graham & Co., St. Andrew's Works, Crofton Park Road, London, S.E.4.

Spark (design only). No. 460,486. Class 13. Sparking plugs and similar electrical devices for igniting the charge in internal-combustion engines, spark intensifiers and component parts of and accessories for ignition devices, lamps, electric lamp bulbs, electric horns, electric safety fuses or cut-outs, electric switches, junction boxes, &c.—Robert Bosch Gesellschaft, 8, Militarstrasse, Stuttgart, Germany (W. P. Thompson & Co., 12, Church Street, Liverpool).

Colco. No. 461,200. Class 13. Clips of ordinary metal for securing wires, tubes and the like to walls.—Colman & Co., 110, Dale End, Birmingnam.

Mulparvo. No. 461,213. Class 18. Electric fires and radiators.—Berry's Electric, Ltd., 85-86, Newman Street, London, W.1.

Midge. No. 461,214. Class 18. Electric fires and radiators.—Berry's Electric, Ltd., 85-86, Newman Street, London, W.1.

New Spanish Company.—La Sociedad Slem is the name of a new company which has lately been formed in Barcelona with a capital of 510,000 pesetas, to manufacture and deal in accumulators.

New French Company.—A new company has lately been formed in Paris (14, Rue Drouot) with a capital of 600,000 francs and the title La Société pour l'Exploitation des Brevets et Procédés Marcel Fichter to manufacture electricity and other meters, automatic time switches, &c.

The "Mulparvo" Heater.—Correction.—We regret that in the advertisement of Messrs. Berry's Electric, Ltd., in our issues of September 11th and 25th, the left-hand block illustrating the "Mulparvo" heater was inserted the wrong way up, and also that the right-hand block showed the heater in a vertical position, whereas it has a slight backward tilt.

For Sale.—By order of the liquidator of Grigg, Ltd., electrical sign manufacturers, of Sanderstead Works, Sanderstead Road, South Croydon, Messrs. Leopold Farmer & Sons will sell by auction on the premises early in November, the stock of electrical signs, plant and machinery, also the freehold manufacturing premises. (See our advertisement pages to-day.)

German Cable Production.—In commenting upon the heavy increase in the consumption of copper which has taken place in Germany in the last year or two, *Commerce Reports* states that this is mainly due to the growth of the cable industry, the capacity of which has been doubled since the war. Germany is exporting cables in large quantities, and the works are said to have orders ahead for some months.

Polish Electrical Engineering Industry.—It is reported from Warsaw that the Protection Union of the Polish Electrical Engineering Industry has recently approached the Polish Ministry of Commerce with a request that, with the object of encouraging the development of the home electrical industry, the import duty on generating machines and motors should be increased by 30 per cent., on cables by 40 per cent., on electrical apparatus, switches, and electro-technical porcelain by 50 per cent., and on electric lamps by 100 per cent.

Unemployment.—For the third week in succession a decrease in the number of unemployed was recorded on September 21st, when the total was 1,312,000, as compared with 1,327,700 on September 14th. The total at the corresponding period of 1924 was 1,180,200.

Copper and Lead Prices.—Messrs. F. Smith & Co. report, October 6th: Copper (electrolytic) bars, £67 5s., 5s. dec. Do., do. sheets, no change; do., do. wire rods, £77 5s., 5s. dec.; do., do. h.c. wire, no change.

Messrs. James & Shakespeare report, October 6th: No change in the prices of copper bars (best selected), sheet and rod, and English pig lead.

Messrs. Edward Till & Co. report, October 6th: No change in the price of india-rubber, Para, fine.

United States Electrical Exports.—During July the United States exported electrical machinery and apparatus to the value of $6,526,668. Although lower than the previous month's figure, this was $286,259 more than the total for July, 1924. The total value of exports for the first seven months of 1925 was $47,787,634, a decrease of $2,197,011. Reverting to the July figures it is seen that there were a number of large decreases as compared with the equivalent figures for 1924. Transformers fell off in value by about one-half to $247,031; generators and parts fell from $380,500 to $370,520; electric railway locomotives from $411,495 to $14,525; stationary and railway motors from $283,742 to $206,126; telephone switchboards from over $150,000 to $50,000; rectifiers, motor-generators, and converters from about $40,000 to $29,642; and there were a number of other decreases. The principal increase occurred in the case of radio apparatus, which rose from $297,586 in July, 1924, to $643,463 in July last. Large increases were also shown by telephone and telegraph apparatus; domestic heating and cooking devices; steam turbo-generator sets; primary batteries; small motors, and many other items.

The Electrical Trade of New Zealand.—The statistics of New Zealand's import trade during the second quarter of the year, published in the *Board of Trade Journal*, show that the value of the imports of electrical machinery was £519,393. The bulk of this (£329,972) came from the United Kingdom, while the United States occupied the second place with goods valued at £141,846. Other exporters were Canada, £21,433; Australia, £7,945; and Japan, £64.

Social Event.—On September 25th, the Dubilier Condenser Co. (1925), Ltd., held its first carnival dance and whist drive at the Chiswick Town Hall, under the auspices of the Dubilier Athletic Sports Association. Two halls were used for dancing. Mr. W. H. Goodman, the managing director of the company and president of the Association, made a short speech, and Mrs. Goodman presented prizes to the successful whist players, and to the wearer of the best fancy dress (Miss Phyllis Leach). It is proposed to hold another similar function shortly.

Orders for Electric Rolling Stock.—Important additions to the rolling stock of the London, Midland and Scottish Railway, for use on the company's Southern electric system, are planned for next spring and early summer. The new rolling stock will serve the Broad Street to Richmond, and Euston to Watford lines, and is intended specially to meet the requirements of the rapidly-developing, residential district between Willesden and Watford. Orders have been placed for a large number of coaches, motors and driving trailers, which will be equipped with the Westinghouse brake apparatus. The new coaches will measure 57 feet by 9 feet and will be of the compartment standard type. New stock of similar type has been ordered for the electric line between Liverpool and Southport.

Lighting and Power Notes.

Bedford.—Extension of Supply.—The Town Council proposes to extend its area of electricity supply to Sandy at an estimated cost of £12,000, and to Potton at a cost of £4,300, and application is being made for sanction to a loan of £16,300 to cover the cost of the scheme.

Bexhill.—Bulk Supply.—The Electricity Commissioners have approved the agreement entered into between the Bexhill Corporation and the Hastings Corporation for a bulk supply of electricity to Bexhill.

Bredbury and Romiley.—Inauguration of Supply.—The Urban District Council's electricity undertaking was formally inaugurated on September 26th. Electricity is obtained in bulk from the Stockport Corporation. The capital cost of the scheme was £20,000.

Canada. — Hydro-Electric Development.—The British Columbia Electric Railway has announced plans for increasing the capacity of its existing hydro-electric generating plant to 700,000 h.p., at a cost of $30,000,000, with an immediate development on the Bridge River to cost $13,000,000 and be capable of generating 62,000 h.p.—*Reuter's Trade Service* (Ottawa).

Continental.—France.—Since the termination of the war, the Compagnie Parisienne de Distribution d'Electricité has effected considerable extensions in connection with the supply of electricity in the Paris district. Five development programmes, involving an outlay of 630 million fr., have been approved by the Paris municipal authorities, and of this sum 470 millions had been expended up to the end of last year. The plant at the St. Ouen and Issy-les-Moulineaux power stations has been increased from 120,000 to 270,000 kW by the addition of five 30-35,000-kW turbo-generators. The third programme involves the substitution for old 10,000-kW turbo-generators of new ones of 12,000 kW, the frequency being at the same time altered from 41⅔ to the standard 50 cycles to enable the company's mains to be linked up with the large hydro-electric systems which are being developed in France. The fourth programme, work in connection with which is well in hand, comprises the installation of three more 30-35,000 kW turbo-generators at the St. Ouen and Issy-les-Moulineaux stations, while the fifth is concerned with the modification and extension of the distribution mains.

Eastbourne.—Electricity Extensions Sanctioned.—The Corporation has received from the Ministry of Transport sanction to a scheme for the erection of overhead lines to provide a supply of electricity to Willingdon. The decision is the result of a recent inquiry.

East Ham.—Loan Sanctioned.—The Electricity Committee has received sanction to borrow £5,000 for the extension of feeder cables from the generating station to Plashet Grove.

Electricity Charges.—The Electricity Committee has recommended the substitution of a flat-rate charge of 1½d. per kWh throughout the year, instead of the winter and summer rates for heating and cooking.

Exeter.—Extension of Supply.—Steps are being taken to extend the h.p. cables to Topsham, and to transfer the Topsham Electricity Co.'s undertaking to the City Council. The following electricity charges are proposed in the Topsham area:—Lighting: 10d. per kWh. Heating and power: 6d. per kWh, with a minimum payment of 10s. per annum. Street lighting: 40s. per annum per lamp of an average of 50 c.p.

Bulk Supply.—The Electricity Committee has recommended that a bulk supply be given to Crediton at 6,000 V, 3-phase, the charge to be at the rate of £5 per kW of maximum demand and 1d. per kWh for energy consumed, subject to a minimum payment of £250 for the first year, £300 for the second, £350 for the third, and £400 for the fourth.

Federated Malay States.—Perak Hydro-Electric Scheme. —*Eastern Engineering* states that it is reported that Sir W. G. Armstrong, Whitworth & Co., Ltd., are prepared to proceed with the Perak river hydro-electric power scheme, subject to the satisfactory results of negotiations which are now proceeding between the company and the Trades Facilities Act Committee. The terms of the draft concession, which will cover the districts of Kuala Kangsar and Kinta, and the Chenderiang Mukim in the district of Batang Padang, are now under discussion, and will in due course be submitted to the Government for approval. The concession now contemplated will not affect the rights of existing concessions.

Guildford.—Street Lighting.—The Electricity Committee proposes to light a number of streets by electricity.

Killamarsh.—Electricity Supply.—The local gas company having intimated that it can make no further reduction in the price of gas, the Council has decided to approach the Staveley Coal and Iron Co. with a view to obtaining a supply of electricity.

London.—Battersea.—The Electricity Committee has received sanction to the borrowing of £30,000 for buildings and £90,000 for plant.

The Committee is making arrangements to supply electrical energy to shopkeepers for lighting their windows after closing hours at the special rate of 1¾d. per kWh and 10s. per quarter for the necessary time-switch.

Hackney.—The Electricity Committee has recommended a scheme for cable extensions, at an estimated cost of £41,850.

Mexico. — Hydro-Electric Development. — According to *Commerce Reports*, the Compania Hidro-Electrica y Irrigadora del Chapala has signed a renewal of the contract with the Federal Government, by which the company is conceded an average of 15 cu. m. of water per second, which can be used between the top of Juanacatlan Falls and a point where the Rio Verde and El Lerma Rivers unite. The company is given the right to construct the necessary dams, and will develop new generating plants of at least 30,000 h.p.

Maidstone.—Extension of Supply Area.—The Electricity Committee has recommended to the Corporation that the scheme for the supply of electricity to the parish of Bearsted be proceeded with at an estimated cost of £6,500.

Newark.—Electricity Charges.—It was reported at a recent meeting of the Town Council that an agreement had been come to with the Derbyshire and Nottinghamshire Electric Power Co., which has powers to supply Newark with electricity in bulk, as to the price to be charged. The Council will pay the company 1.25d. per kWh, a minimum guaranteed consumption equivalent to £2,000 for the first two years and £3,000 for each subsequent year of the agreement. The Council proposes to charge power users a special basic price of £8 per kW on the annual maximum demand, plus .3d. per kWh consumed. Small consumers will be charged a flat rate of 7d. per kWh for lighting, 2½d. per kWh for domestic appliances, and 3d. per kWh for small motors.

Peterborough.—Purchase of Cookers.—The Electricity Committee is applying for sanction to the borrowing of £1,500 for the purchase of 100 electric cookers.

Preston.—Year's Working.—The accounts of the Corporation electricity undertaking (engineer: Mr. J. F. Simpson) for the year ended March 31st last show a total income of £105,542, as compared with £92,167 in the preceding year. Working expenses amounted to £64,176, as against £48,783, leaving a gross profit of £41,366 (£43,384), to which was added interest and a grant from the Unemployment Grants Committee, making a total of £43,344. After deducting capital charges and contributing £792 from revenue to capital account, a net surplus of £7,979 remained. The previous year's working resulted in a surplus of £15,876. The capital expenditure amounted to £166,824, and included £85,290 for plant, machinery, &c., at Ribble power station, and £74,156 for mains and services. The electrical energy sold increased from 7,712,908 to 9,798,324 kWh, and the maximum supply demanded from 3,460 to 4,000 kW.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Stafford.—Heating and cooking: 1d. per kWh.

Burnley.—Lighting: In the borough, from 5½d. to 5d. per kWh; for certain "off-peak" hours the charge will be 2½d. per kWh. Outside the borough, from 6½d. to 6d. per kWh, and for certain "off-peak" hours, 3d. per kWh. Heating and domestic purposes: Flat rate of 1½d. per kWh.

Erith.—Heating: From 3d. to 2d. per kWh.

Hebden Bridge.—Domestic purposes: From 1½d. to 1¼d. per kWh.

Salford.—Charges for Electric Cookers.—The Electricity Committee has adopted the following scale of charges for the hire of electric cookers:—Small standard cooker, a rental of 7s. 6d. per quarter; medium standard cooker, 10s. per quarter. These charges include the provision of a thermometer and an electric kettle, also free wiring up to a maximum of 50 ft. and free maintenance.

South Africa.—Cape Town.—Work has commenced on the new power station near the mouth of Salt River. The erection of the station is part of a scheme which involves an expenditure of about £1,000,000. When completed, the station is intended to supply the energy required for the electrification of the Cape Peninsula railways.

Southampton.—Year's Working.—The report on the working of the Corporation electricity undertaking (engineer: Mr. W. G. Turner) for the year ended March 31st last shows a total income of £173,654, as compared with £149,780 in the preceding year. Working expenses amounted to £111,002, as against £101,123, leaving a gross profit of £62,652 (£48,657). Interest and sinking fund charges absorbed £40,018, special expenditure charged to revenue amounted to £15,355, and £5,000 was contributed to the borough fund, leaving a balance carried forward of £2,279. During the year £110,907 was spent on capital account, the chief items being £41,037 for machinery, &c., £59,510 for mains and services. The electrical energy sold increased from 13,416,882 to 17,909,256 kWh, and the maximum supply demanded from 8,363 to 10,064 kW. A 6,000-kW turbo-alternator was put into commission in December last, and the second 1,000-kW rotary converter put into operation at Back-of-the-Walls sub-station in January.

Spalding.—Electricity Supply.—In granting the Urban District Council a Special Order to supply electricity within the urban and rural areas, the Electricity Commissioners have intimated that they consider the offer made by the Boston and District Supply Co., Ltd., for a supply of electricity in bulk to be satisfactory and one which should be accepted by the Council. The Council desires to have its own generating plant at the gas works, and the estimated cost of this scheme is £30,000.

(*Continued on page 583.*)

An Electric Wire and Small Fittings Factory.

A Visit to the Works of Messrs. Ward & Goldstone, Ltd., Manchester.

The present factory of Messrs. Ward & Goldstone, Ltd., at Manchester, to which we had the opportunity to pay a visit recently, was established in 1918, when the firm of Ward & Goldstone was converted to a public company under the style of Ward & Goldstone, Ltd. The premises, which cover an area of about two acres of ground and six acres of floor space, consist mainly of a two-bay building constructed on modern factory lines with steel-framed glass roofs, and an additional and adjacent three-storey brick building. The main building is devoted principally to the manufacture of rubber and cotton cables, the stranding and rubber covering being carried out in one bay and the vulcanising and braiding in the other.

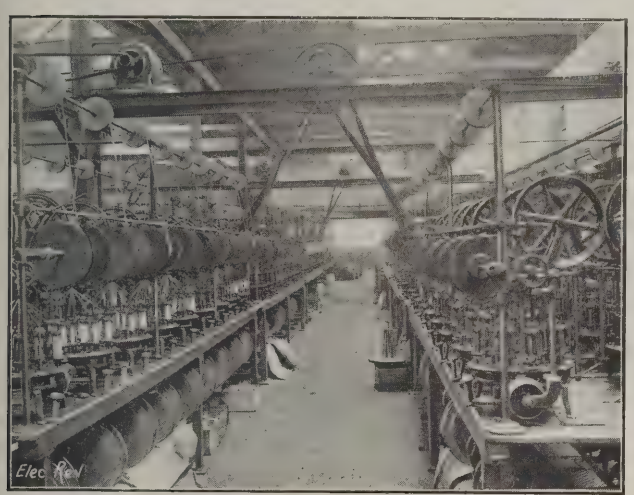


Fig. 1.—Corridor in Braiding Department.

The lay-out of the machinery is such as to facilitate the progress of manufacture, enabling the material in the various stages to be passed from one machine, or group of machines, to another without congestion. All sizes and grades of indoor cables are made at the works, up to 37/12, including the whole process from the wire stranding.

The cable machinery operations are effected in the centre portions of the bays, where the stranding, rubber covering, rubber-winding and rubber-forcing machines are located, and the plant for each operation is set out as a separate department or shop.

Fig. 2.—Fine Silk- and Cotton-Covering Machines.

Fig. 7 is a view of the heavy wire-stranding department. The machines at the front are stranders of the tandem type, used for the heavier gauges of wire, while at the back, high-speed torpedo stranding machines are in service for the stranding of medium- and light-gauge wires. The stranding of flexible wire is a very delicate operation, and is effected by these machines at high speeds.

Three methods of rubber covering are used according to the grades of cable required. Fig. 3, p. 580, is a view of the longitudinal rubber-covering machines, in which the conductor is rolled between two strips of rubber, the machine rollers being grooved to accommodate the cable, where it is covered and the rubber sealed on each side, and some of the heavy-wire rubber insulating machines are shown in fig. 4. Some of these machines give the wire two coverings of rubber in one operation or journey through the machine. The rubber-winding machines are very similar in design to the tandem stranding machines, the rubber strip being rotated about the travelling wire. One machine in this department is of particular interest, in that it effects rubber lapping and cotton covering twice in one operation. These machines are used particularly for the manufacture of bell wire. The rubber-forcing machines are chiefly used for cab-tire sheathed cables, the inner insulation of which is applied first by the rubber-covering equipment. The rubber is forced through a mould surrounding the travelling wire, the mould being heated by steam. The cables, after being dealt with by the rubbering plant, are taken to the vulcanising department. This is situated at one end of one bay and is equipped with two large and one small vulcanising pans, one large one of which is shown in fig. 6.

The next performance in the manufacture of rubber cable, braiding, is carried out in the braiding shop, fig. 1, where there are two parallel rows of vertical braiding machines using hemp, pure silk, or ordinary cotton according to the quality and size of the wire required. The cables pass through the revolving reels of hemp, &c., and are taken off spools under the benches and rewound on others at the tops of the machines. The pattern-braiding process, in which revolving reels carry material of varying colours, is a fascinating operation. Compounding tanks are provided at the far end of the factory for the next operation, where the cables are run through hot bitumen fluid. These tanks are easily convertible for use as enamelling tanks, the process being very similar.

All cables are tested before dispatch in a well-equipped test room. Mirror-galvanometer tests are applied to the insulation, and bridge tests to the conductors. The wires are also subjected to pressure tests, in which a pressure of 5,000 V is put on the cables for 15 to 30 minutes. A small motor generator and a transformer are provided for the purposes of these tests.

Fig. 2 is a view of the fine silk- and cotton-covering machines which deal with all qualities of flexible cords, including telephone leads, for the Post Office and Admiralty, and leads for automobile equipment. Very delicate silks are used in this portion of the works,

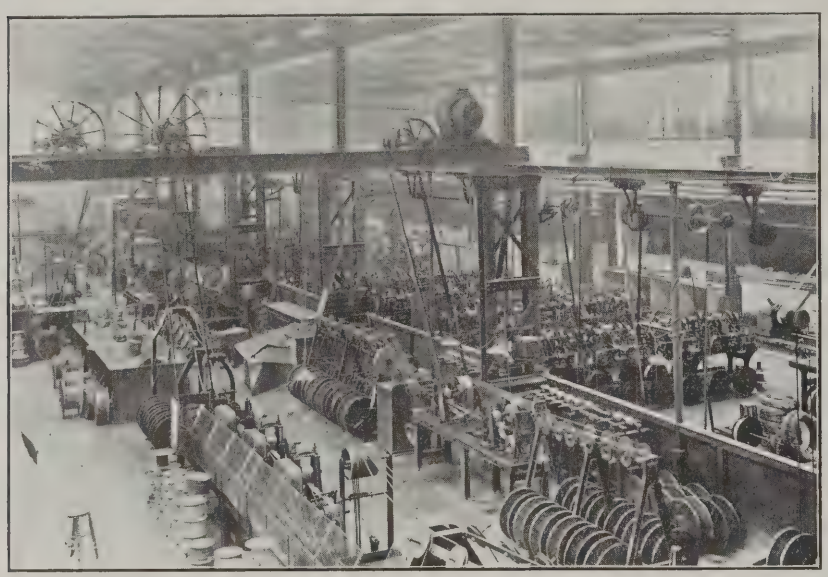

Fig. 3.—Longitudinal Rubber-Covering Machines.

which is rather more suggestive of a silk or a cotton mill than a cable works. The machines shown are of the multiple type, each applying two or more coverings in one operation. The bench at the front is the testing bench for this class of cables, which are examined under a microscope as they are unreeled and rewound from one spool to another. Fig. 8 shows the double cotton-covering machines.

Considerable motor-car cable work is done in this department. This cable is taped with oilproof tape, braided, and then varnished. The varnishing room is in front of the test bench, where a very high grade of varnish, which is claimed to stand the most severe bending test, is used. This process is also used for wire for armature and field coils for small motors, &c. A large quantity of the motor-car cable is armoured, and this performance is done on machines which wind either aluminium, brass, or other metal wires neatly round the cables or leads.

The front end of the main building is arranged in two storeys, the upper floor of which consists of the loom department and the cord room. In the former the telephone and motor-car multiple leads are put through their final operations. The telephone cords are plaited by either of two machines, 4-way or 6-way, which were built to Mr. Ward's own design. The terminals are sweated to the leads in dipping baths in this section of the factory, and the multiple leads are braided by machines which are skilfully operated to reduce the size of the braiding at the ends of the leads, where a lesser number of "singles" is accommodated, and also, in the case of head 'phone leads, &c., to make neat joints where the conductors branch off. The cord room is devoted wholly to telephone cords. The ends of the flexibles are stripped and bound in preparation for the terminals of varying shapes by a looping machine, another little device of Mr. Ward's design. An interesting product of the firm of Ward & Goldstone is what is termed I.E.E.-quality flex. This is treated with two layers of pure rubber, and then cotton covered, braided, and finally twisted. The drums on which the wire is dispatched from the works are made in a well-fitted-out joiners' shop. separate department deals with the winding of instrument wires on small reels and special drums. Fig. 5 shows the fine flexible wire-stranding machines.

The manufacture of the accessories is carried out entirely on the two upper floors of the three-storey adjacent building already referred to, the greater part of the ground floor of which is used as the general stores. Probably the most interesting manufacture undertaken in this building is that of a special insulating compound in the form of bases for wireless coil holders, Home Office pattern lamp holders, &c. The material is produced from a special powder of Ward & Goldstone's own preparation, which is put into moulds and heated under pressure on hand-operated highly-geared moulding presses. Six of these presses are at present installed, three steam and three electrically heated. The product is a black compound of very superior finish, and it is claimed that its insulating qualities are exceptionally high, and that it will withstand a very high temperature without breaking or crumbling. In cases where metal parts are embedded in the compound, these are, of course, placed in position in the mould with the powder before it is put on the pressing machines.

The first floor of this block is devoted to the manufacture of switches and light metal work, including all manner of wireless apparatus, ironclad switches, fans, G.P.O. telegraph sounders and tappers, &c. The bulk of the metal work is turned on standard capstan lathes in the machine shop. Automatic machines are also provided for turning up brass parts, such as adaptors for headlights for cars. A few engraving machines on which the firm's own engraving is done are also installed in this room.

The top floor is equipped with apparatus for metal stamping, stove enamelling and nickel plating, &c. Magneto plates for automobiles, wireless transformer stampings, and similar work are turned out on metal stamping machines. Two Canning nickel-plating machines are installed in a room divided off from the machine room. The assembling of all manner of small accessories is undertaken on this storey, including such articles as "Voltalite" generators and lamps for cycles.

Fig. 4.—Heavy Rubber-Covering Machines.

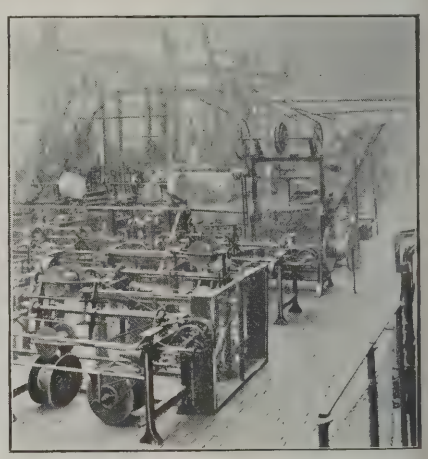

Fig. 5.—Fine Flexible Wire-Stranding Machines.

Electric drive is used throughout the factory, and in several departments, including the braiding room, fig. 1, small workroom, where a steam engine operated the first wire-covering machine. The founders and directors of

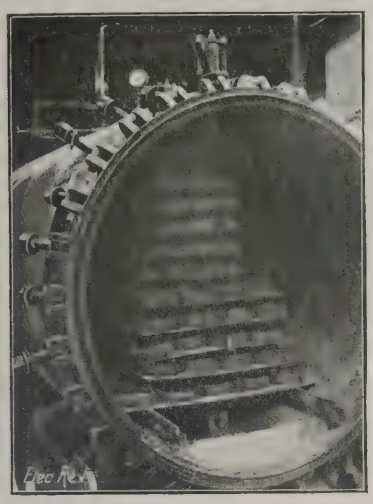

Fig. 6.—Vulcanising Pan.

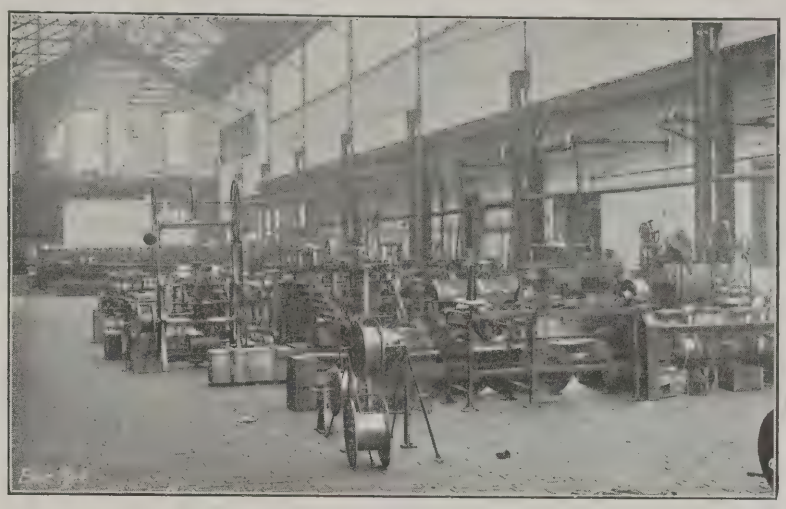

Fig. 7.—Heavy Wire-stranding Department.

this is arranged overhead by motors mounted on steel girders. The supply is at present d.c., and is received direct from the Salford Corporation electricity works, but it is about to be converted to 3-phase a.c., and a sub-station is being provided to receive a high-pressure supply at 6,500 V, which will be reduced to 420 V by a 200-kVA static transformer. A low-pressure 6-panel open-type slate switchboard is being erected by Messrs, Ward and Goldstone for distribution throughout the works.

The works are at present turning out over a million yards of flexible cord per month, and are capable of dealing with 30 to 50 tons of wire per week, but it is anticipated that with extensions to the factory which are now well in hand, this output will be doubled. The extensions will comprise a new bay to the main building, measuring 120 ft. by 35 ft., with an additional extension of 40 ft. by 30 ft.

About 750 hands are employed at the works, and the majority of the charge hands are given a financial interest in the concern. Canteens are provided for the benefit of all employés whose social life is not overlooked, sports, clubs, &c., being organised for their entertainment.

It is interesting to recall that the original works of Ward & Goldstone were established 30 years ago in a

the firm are proud to be able to claim that to some extent the firm has changed the situation which existed in the

Fig. 8.—Double Cotton-Covering Machines.

early days, when the flexible-cable industry was largely in the hands of foreign manufacturers.

Hydro-Electric Progress in Switzerland.

Some Details of the Amsteg (Uri) Power Station.

There are several interesting features in the hydro-electric station recently established by the Swiss Federal Railway authorities at Amsteg (Canton of Uri) in connection with the supply of electricity for the Gothard line. The station utilises the water power of the River Reuss, between Gurtnellen and Amsteg. The barrage is located at Pfaffensprung, and impounds 200,000 cubic metres of water, at an available head of 270 m.; it is constructed on the arched-dam system, as shown in figs. 1 and 2, reproduced from the *Génie Civil*. The height of the dam is 21 m. from the river bed, and the width of the span at the top 25 m.; the masonry is 3.5 m. thick at the base and 1 m. at the top, where the radius curvature is 18.5 m. Theoretically, a thickness of 2.2 m. at the base would have been sufficient. The structure was mathematically investigated as though it were the arch of a bridge, with regard to the effects of compression and changes of temperature, and in order to secure the most favourable conditions, vertical joints at four places in the upper portion were left open during the construction and after the barrage had been exposed to cold weather for a long time they were closed with cement mortar. The work was finished four years ago, and has been under load for three years with completely satisfactory results. From the intake the water is conveyed under pressure to a water tower through a tunnel $4\frac{5}{8}$ miles in length, and of approximately 70 sq. ft. section. The water tower, which is situated above the village of Amsteg, consists of a shaft 16.4 ft. in diameter and $98\frac{1}{2}$ ft. deep, cut in the solid rock; at its lower end it is connected to a gallery 360 ft. in length and 753 sq. ft. in section, and at its upper extremity to a discharge shaft 262 ft. long and 236 sq. ft. in section. From the water tower the water is conducted to the station by means of three steel pressure conduits, each 1,476 ft. in length and of a diameter partly of 5.9 ft. and at the lower end of 5.25 ft. Each of the pipes is intended to feed two 10,000-kW turbine-generators.

So far only five sets have been installed. The turbines are of the Pelton type, constructed by the Société des Ateliers de Constructions Mecaniques, of Vevey, and are coupled direct to Oerlikon alternators. Work is, however, well in hand on the construction of the sixth set.

The turbines are designed to work with water under a head of 902 ft. and a delivery of 1,045 gallons per second, the running speed being 333½ r.p.m. When the station was first projected two schemes were considered, one involving the use of single-rotor turbines operated by two jets, and the other turbines with twin wheels

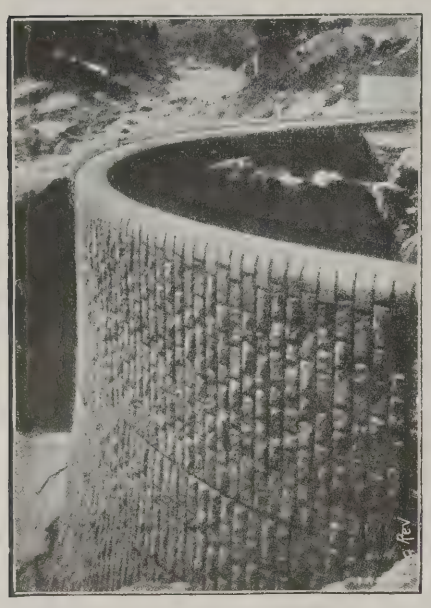

Fig. 1.—The Dam seen from above.

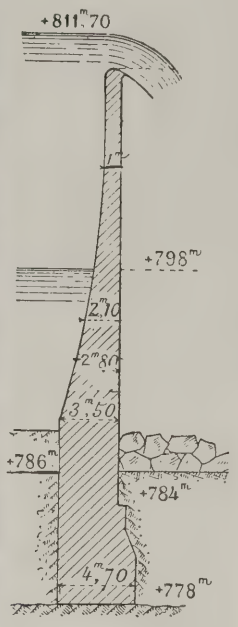

Fig. 2.—Section of Dam at Key.

on the same shaft, each actuated by a single jet. The railway authorities finally decided in favour of the latter type, which possesses the advantage of having more readily accessible injectors and a better water flow. The diameter of the wheels is 6 ft. 1 in., and that of the two jets 215 mm.—about 8.4 in. It is claimed that they are the largest jets so far used in Europe. Each of the wheels is enclosed in a separate casing mounted on

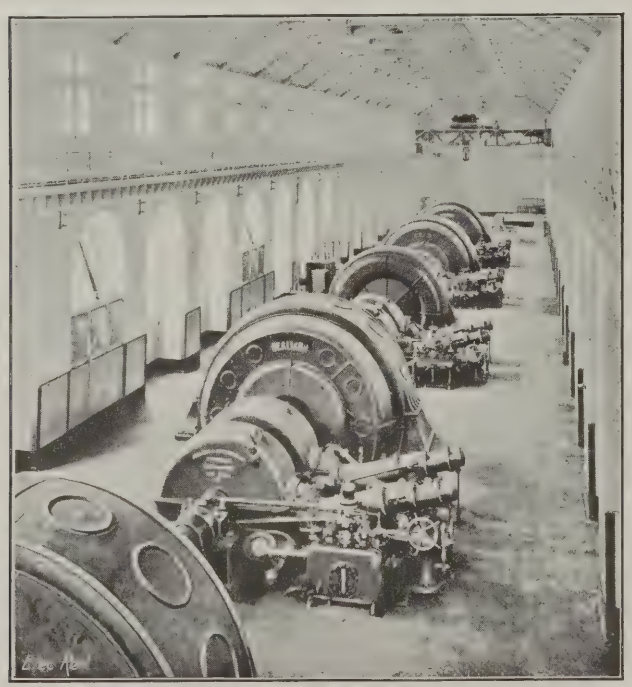

Fig. 3.—The Interior of the Turbine Room.

a common cast-iron base located on steel plates, these being employed in order to protect the masonry of the discharge canal from the action of any water projected from the wheel outlet and from the jets when the latter are suddenly charged.

The Pelton wheels comprise 20 cast-steel blades or vanes, polished on their inner faces; as each vane receives no fewer than 333 17½-ton impulses per minute, special attention was devoted to their secure attachment, this being effected by two special rings bolted to the hub disk, an arrangement which also makes it possible to dismantle the vanes without disturbing the disk.

The two cast-steel injectors each carry a tuyere of similar material with a bronze nozzle, which can be readily renewed. A needle valve in the centre of the circular tuyere enables the water supply to the turbines to be adjusted in accordance with the load. The needle valves are screwed to rods which at their outer ends carry the adjusting pistons of the oil-pressure servo-motors. The thrust of the water on the needle valve is partially balanced by powerful steel springs mounted within the servo-motors to facilitate hand regulation. Although the tendency of the needle valve in all its positions is to close the tuyeres, any sudden closing is rendered impossible by means of a special arrangement of the servo-motors to act as oil brakes should the needle valve close. A second system of control is furnished by a deflector screen surrounding the jet, by means of which the water can be instantly diverted from the turbine in the case of a sudden decrease of load, the screen being actuated by an independent

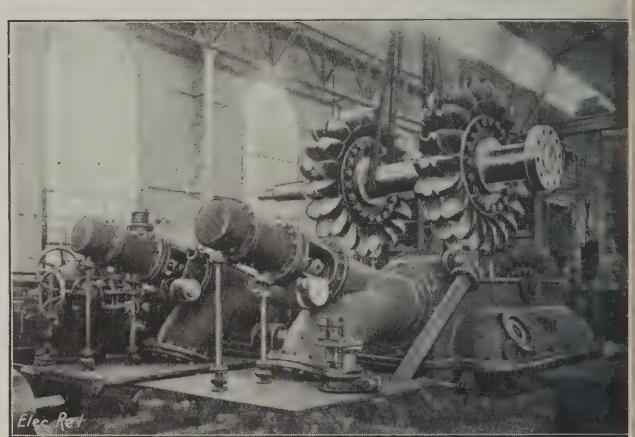

Fig. 4.—A Pelton Turbine During Erection with the Twin Wheels Suspended.

servo-motor. In order also to prevent any interruption of the supply in the event of accident to the double-action regulator, a device has been incorporated by means of which, in such a case, the hand regulation gear is automatically brought into action. An automatic speed controller is also included in the equipment, which automatically diverts the water from the jets whenever the speed of the turbine increases more than 20 per cent. above the normal rate. The turbines are direct coupled

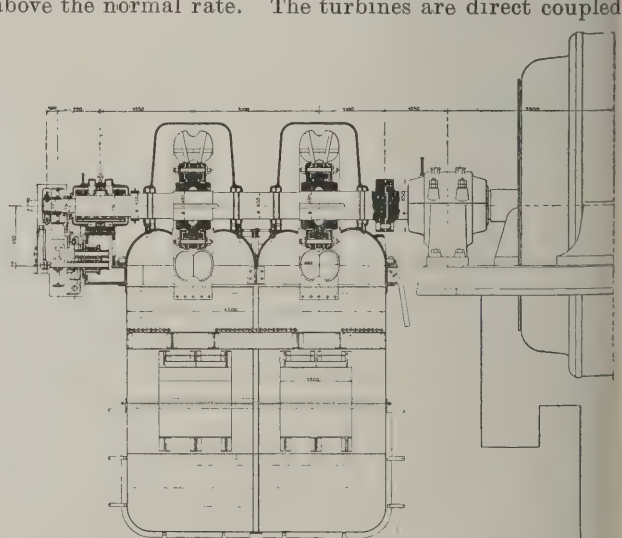

Fig. 5.—Section of 14,300 h.p. Twin-wheel Turbine.

to Oerlikon six-pole totally-enclosed alternators generating single-phase current at 15,000 V, which is stepped up to 60,000 V by 10,000- and 5,000-kVA oil-immersed core-type transformers.

Fig. 3 is a view of the interior of the turbine room, and fig. 4 shows one of the turbines, with the twin wheels suspended, during erection, while fig. 5 is a section of one of the twin Pelton wheels.

Lighting and Power Notes.

(*Continued from page 578.*)

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Western Electric Distributing Corporation, Ltd., to supply electricity within parts of the rural districts of Bath and Frome; and the Lancashire Electric Power Co., for the supply of electricity in the urban district of Leyland.

The Gwynedd Trust, Ltd., has applied to the Commissioners for an amendment of the Flint and Holywell District Electricity Order so as to include the parish of Gwaensygor.

Spenborough. — Proposed Change-over.—Application is being made for sanction to borrow £5,000 for the change-over of the system of supply to a.c. for the whole area.

Straits Settlements.—Singapore.—According to *Eastern Engineering*, in his report for the year 1924, Mr. W. S. Dunn, municipal engineer, states that the scheme for the replacement of street oil lamps by electric lamps was completed during the year. The cost of public street lighting was $105,358, and in addition to this, $2,310 was expended on the purchase of lamp posts.

Stone.—Electricity in Bulk.—The Urban District Council is arranging with the Stoke-on-Trent Corporation for a bulk supply of electricity.

Stoke.—Loans Sanctioned.—The Electricity Committee has received sanction to loans of £6,000 for electricity mains and switchgear in connection with a supply in the Fenton district; and £2,650 for buildings and equipment.

United States.—Electrical Development.—According to *Power*, the new central steam-power station built on the Broad River at Parr Shoals, S. C., by the Broad River Power Co., was recently inaugurated. The first section, the construction of which was started last November, has been completed at a cost of $3,000,000, with an extensive system of h.p. transmission lines. The plant, which has been designed for an ultimate capacity of 85,000 h.p., will furnish a supply in Columbia and Spartanburg and throughout Central South Carolina. Powdered fuel is being employed at this station.

In order to meet the increased demand for power at Baltimore, the Consolidated Gas, Electric Light and Power Co. has started on the erection of a steam generating plant planned some time ago. The new station will be ready for operation in about a year, and will be designed for four 36,000-kW turbo-generators. Only one of these sets, however, is to be included in the first installation.

Wimbledon.—Loan Sanctioned.—The Electricity Committee has received sanction to borrow £10,000 for the purchase of domestic appliances to be let out on hire.

Worthing.—Inquiry.—Col. T. C. Ekin, on behalf of the Electricity Commissioners, held an inquiry at the Town Hall on September 29th into the applications of the Corporation and East Preston Rural District Council for Orders to supply electricity in the rural district of East Preston. For the Corporation it was stated that it was proposed to make a charge of 6½d. per kWh for lighting, which was the same as that charged in the borough, and that the Rural Council could not give a supply at such a low rate. For the Rural District Council it was suggested that it should have control of the development of electricity in its area. It was proposed to obtain a bulk supply from Worthing and to retail it at 8d. per kWh for lighting and 2½d. per kWh for power and heating. The Corporation stated that it was not prepared to give a bulk supply. The Commissioners will intimate their decision in due course.

Tramway and Railway Notes.

Belgian Congo.—Railway Electrification.—According to *The Times Trade and Engineering Supplement*, the Technical Committee appointed a year ago to study the proposal to electrify the railway from Matadi to Kinshasa has reported in favour of immediate electrification. The Mpozo falls would be utilised to generate energy for the coastal section of 100 km. and if the necessary arrangements can be made in time to permit work to be begun at the termination of the next rainy season, it is believed that the electrification of this portion of the line could be completed by the end of 1928. This initial programme would be followed by the conversion of the remainder of the line, the Inkisi falls being harnessed to provide the necessary power. It is estimated that the electrification of the entire line would occupy six years. The Congo railway is 400 km. in length.

Bradford.—Year's Working.—The report on the working of the Corporation tramway undertaking (manager: Mr. R. H. Wilkinson) for the year ended March 31st last shows a total revenue of £628,263, as compared with £619,581 in the preceding year. Working expenses amounted to £486,893, as against £486,449, leaving a gross surplus of £141,371 (£133,132). After deducting capital charges there was a net surplus of £51,846. The income from the railless-car service was £21,371, and the final result was a deficit of £5,315. There was a net surplus of £601 from the Parcels Department. The total net surplus from the three undertakings was £47,132, which was appropriated as follows: Contribution to capital account, £18,000; reserve or renewals fund, £16,132; rate relief, £13,000. The amount spent on track renewals during the year was £134,591, of which £120,796 was charged to capital account and the remainder appropriated from revenue. The number of passengers carried by the tramway and railless-car services increased from 92,683,421 to 100,150,739, and the car-miles run from 6,863,348 to 7,045,762.

Motor Omnibuses.—A special sub-committee of the Corporation Tramways Committee, appointed to consider the possibility of running 'bus services between tramway routes, has recommended the purchase of twenty-four motor 'buses, at an estimated cost of £1,500 each.

Blackpool.—Track Renewals.—The tramway track between the Cabin and Bispham on the Fleetwood section is to be re-laid to enable the present promenade service to be extended to Bispham. The cost is estimated at £7,395.

Continental.—Belgium.—The French Dyle et Bacalam Company recently made application to the Belgian Ministry for Railways for a concession to construct three metropolitan lines in Brussels. This has now been followed by the Société Générale de Chemins de Fer Economiques, which has offered to construct the permanent-way of a network of metropolitan lines at the cost of the conceding authority on condition of being granted a working concession for the three lines proposed, of a total length of 8.7 miles, capable of being ultimately extended to 21 miles. In addition, the same company has offered to construct a tunnel with a double line of normal gauge to connect the Northern and Southern railway stations at the cost of the State.

Switzerland.—Plans have been prepared for the electrification of the Rorsbach-Heiden mountain railway.

Germany.—A preliminary concession has been granted in respect of a projected electric tramway between Falkenstein and Rodewisch, Saxony.

Rumania.—The Bucharest Tramway Co. is reported to have placed a contract with a Belgian concern for the electrification of its tramway system and for the construction of several new lines in the city of Bucharest.

Sweden.—Application is being made by the Swedish State Railways for a grant of 3,050,000 kr. for the electrification of the western main line. The line near Stockholm is also to be reconstructed.

London.—Underground Station Improvements.—Three of the five new "comb" escalators at Tottenham Court Road were put into service on September 29th, and the dismantling of the eight lifts was commenced. The space now occupied by the lifts will be used for the provision of a large booking hall. The scheme of improvements provides for the merging of the Hampstead and Central London stations into one large station. The number of passengers dealt with at the Tottenham Court Road stations in 1924 amounted to 20,000,000, and the improvements will allow for an increase of 50 per cent. in the annual traffic.

Straits Settlements.—Penang Hills Railway.—We have received from Mr. W. J. Williams, engineer and manager of the Penang municipal electricity supply and tramway undertakings, a copy of his report, together with the statement of accounts, on the working of the Penang Hills Railway for the year ended December 31st last. The total revenue amounted to $63,818, and working expenses were $55,446, leaving a gross profit of $8,372, to which was added $7,070 brought forward at December, 1923, and interest of $79, making a total of $15,521. Of this amount $13,741 was appropriated for expenditure on construction during 1924, leaving a balance of $1,780. This railway was opened for traffic on October 21st, 1923, and the capital expenditure to that date was $1,489,130. Additional expenditure on construction amounted to $1,130 during 1923, and $69,449 during 1924, making a total of $1,559,709. The number of passengers carried during the year under review was 81,900, and the car-mileage was 12,927.

Wallasey.—Track Renewals.—The Tramways Committee has had under consideration a report submitted by the borough engineer on the reconstruction of the tramway track in various parts of the district. The estimated total cost of the scheme, to be spread over eight years, is £194,850. The Committee has recommended the Council to proceed with the first section of the work from Liscard Village to Mount Pleasant Road at a cost of £16,500.

Telegraph and Telephone Notes.

Australia.—"Beam" Radio Stations:—A resolution was proposed by Mr. G. A. L. Green (South Africa) at the Imperial Press Conference, which is being held in Australia, urgently impressing on the Imperial Government the necessity of expediting the completion of "beam" stations in England, and was carried. According to the *Financial Times*, Mr. Bruce, Federal Prime Minister, strongly protested against the refusal of the British Government to permit Australia to control a reciprocal "beam" station in Great Britain. Australia, he said, demanded the same privileges as were granted to Canada, foreign countries, and the cable companies.

China.—Telegraph Operators' Strike.—The operators of the Chinese Telegraph Administration struck work last week. They are demanding increased pay and better treatment.—*Reuter* (Shanghai).

New Radio Station.—It is reported that Messrs. C. Lorenz and Co., of Tempelhof, Berlin, have lately secured a contract for the equipment of a wireless station at Canton for ship communication purposes.

Czecho-Slovakia.—Automatic Telephony.—Work is well in hand on the conversion of the telephone exchange in Prague to automatic operation on the Siemens and Halske system. Out of 12,000 subscribers' lines, about 4,000 are now worked automatically, the apparatus having been supplied by the Telegrafia Co., of Pardubitz.

Post Office Revenue.—Treasury Returns.—The Treasury returns for the first half of the financial year indicate that the revenue of the telegraph service amounted to £2,600,000, a decrease of £100,000 as compared with the corresponding period last year; the income of the telephone undertaking was £7,750,000, an increase of £50,000.

The Telephone Service.—Exchange Names.—In anticipation of the coming change to automatic switching, three telephone exchanges were renamed on October 1st: East Ham became Grangewood, Kingsbury is now Colindale, and Woodford has become Buckhurst. The new Sloane exchange also had the bulk of its subscribers allotted to it from four other exchanges.

Radio Notes.

Daventry.—Aerial Fault.—A breakdown of the aerial at the B.B. Co.'s high-power station (5 XX) on September 30th caused the afternoon programme to be interrupted for a time. The fault was soon rectified. The usefulness of the station was increased as from October 1st by an extension of the hours of broadcasting. For a period of one month as an experiment it will transmit additional programmes from 11 a.m. to 2 p.m. daily, except on Saturdays and Sundays.

Geneva Conference.—Too Many Stations.—Changes in the conduct of broadcasting in Europe are foreshadowed as a result of the International Wireless Conference which has just been held in Geneva. According to *The Times*, delegates to the conference are agreed that Europe has more broadcasting stations than can be possibly fitted into any wave band which the Governments of Europe are ever likely to set aside for broadcast purposes. It is felt that instead of having the present large number of comparatively low-power stations, Europe in the future must have fewer and more powerful transmitters. It was realised from the beginning of the Geneva Conference that there were not sufficient separate positions in the broadcast wavebands to give to every station a place to itself. Some stations had to be put on the same wavelengths. This part of the scheme was governed by geographical considerations, the power used by any two stations, and their distance apart. All sorts of adjustments were made during the recent tests, but this part of the plan was a failure. Sooner or later each station must have its own wavelength. Meanwhile something must be done to keep the present cause of interference between the stations of Europe to the least harmful limits. The conference decided on a temporary plan, which differs in many respects from that on which the recent tests were based. The new scheme will come into operation about November 1st. Another meeting of the board will take place in December. Additional details of the scheme will be announced as they are arranged by the permanent staff at Geneva. New stations will be given positions below 200 metres.

Imperial Press Conference.—Broadcasting Committee.—At the Imperial Press Conference, which is being held this year in Australia, Sir Percival Phillips (Great Britain) opened the discussion on broadcasting. He said that there seemed to be a prospect that broadcasting would conflict with the interests of the newspapers. Mr. C. F. Crandall (Canada) moved the appointment of a special committee of the Empire Press Union to keep in touch with the Dominions in order to watch the course of broadcasting. The resolution was carried.

Irish Free State.—Appointment of Broadcasting Officials.—The Ministry for Posts and Telegraphs has, according to the *Wireless Trader*, invited applications for the following positions in connection with the new broadcasting station at Dublin:—Station director, assistant engineer, musical director, and announcer. The salaries are £750, £300, £400, and £250 per annum respectively, and it is believed that the appointments will be made sometime during this month. The posts of musical director and announcer will be part time, and all positions will be non-pensionable. The appointments will be made by a Selection Board, acting under the Civil Service Regulations Act, and will be for a period of one year, and subject to termination at a month's notice.

Selection Committee.—Mr. J. C. W. Reith, managing director of the B.B.C., and Sir Hamilton Harty have been appointed to the Selection Committee which will draw up a scheme and make recommendations to the Free State Government in respect of all aspects of its broadcasting organisation. The Committee consists of officials appointed by the Free State Civil Service Commission. All the members are of Irish birth with the exception of Mr. Reith, and the B.B.C. is co-operating with the Free State Government in order that the broadcasting service in Southern Ireland shall be started on a firm foundation. The first meeting of the Committee will be held in Dublin on October 13th, and it will deal with the appointment of the staff.—*Manchester Guardian.*

Italy.—New Station.—Owing to an error in a Marconi communication, it was stated last month that the company was erecting a broadcasting station in Milan. The facts are that it has received an order for a broadcasting station in Rome of a larger power than the one which was erected by it there some time ago, and which is now working. As soon as the larger station, which will be of 12 kW, is in operation, the smaller, a 6-kW station, will, we understand, be removed to Naples.

New Zealand.—New Station.—Figures made public last June show that there were just over 4,200 holders of listening licences in New Zealand. Until the 500-watt station of the broadcasting company is ready to begin service, the Government has authorised existing stations to carry on, and is subsidising them, says the *Australian Electrical Times*. Auckland's broadcasting station (IYA) has taken the call sign VLAK and wave-length of 420 metres. With a subsidy of £15 per week from the Postal Department and £15 from traders, and under the supervision of a local committee representing, as well as the company, the trade Postal Department, and listeners, an improved service is promised.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Ashford (Kent).—Urban District Council. Electricity meters. (October 2nd.)

Australia. — Melbourne. — December 1st. Postmaster-General's Department. Motor-generator sets for charging secondary batteries. (October 2nd.)

Sydney.—December 16th. New South Wales Government Railways and Tramways. 10 single-phase, 1,800-kVA transformers.*

Belfast. — November 2nd. Electricity Department. Motor-generator and transformer. (See this issue.)

Belgium.—October 31st. Association Liegoise d'Electricité, 33, Rue Darchis, Liege. Supply of electricity distribution mains in the communes of Horion-Hozemont, Awans, Xhendremael, Houtain-Saint-Simeon, Hermée, and Vottem. Particulars from above address.

Bristol.—October 19th. Port of Bristol Authority. Two 2-ton electric capstans. Specification from the General Manager and Secretary, 19, Queen Square, Bristol.

Dartford.—October 17th. Electricity Works. Small steam coal for 6 or 12 months. (See this issue.)

Dublin.—Electricity Department. Transformers for one year. City Electrical Engineer, Fleet Street, Dublin.

Dublin Borough Commissioners. Electric wiring of 416 houses at Croydon Park. City Architect, Exchange Buildings, Lord Edward Street, Dublin.

Edinburgh.—October 16th. Corporation. 12 electric tramcar trucks, electrical equipment of cars, and air-brake equipment. Specifications from the manager.

October 13th. Electricity Department. Cables, conduits, pavement box frames and covers, fuse boxes, meters, meter boards, &c. (See this issue.)

Edmonton.—October 13th. Board of Guardians. Electric lighting and power installations at Enfield House. (September 25th.)

Egypt.—Cairo.—December 1st. Ministry of Public Works. Two pumping units and accessories for the Mex pumping station.*

Glasgow.—October 19th. Parish Council and District Board of Control. Stores, including electrical fittings, for six months. Forms of tender from Mr. M. A. Reynard, inspector and clerk, 266, George Street.

Leeds.—October 20th. Tramway Department. 150 double-deck top-covered tramcars complete, or, alternatively, 150 tramcar bodies, 190 tramcar trucks, including wheels and axles, 190 tramcar electrical equipments. (October 2nd.)

Lichfield. — October 19th. Electricity Department. Transformers, switchgear, and cable connections; e.h.p. and l.p. cables, boxes, and roadwork; e.h.p. overhead transmission line. (September 25th.)

London.—Islington.—November 11th. Electricity Department. 3-phase, 6,000/6,600-V and two-phase or single-phase 2,500/2,000-V switchgear and accessories. (September 25th.)

H.M. Office of Works.—October 14th. Dismantling wiring and rewiring in conduit at Charity Commissioners' office, Ryder Street, W. (September 25th.)

Manchester.—October 13th. Electricity Committee. Twelve months' supply of wooden cable troughing, capping and boards. Form of tender from Mr. H. C. Lamb, manager, Electricity Department.

Newport (Mon.).—October 28th. Electricity Department. Electrically-driven pumps, pipework, valves, &c.; switchgear; water-screening plant. (October 2nd.)

New Zealand.—Wellington.—Public Works Department. December 8th. Steel transmission line supports for the Waikato power scheme.*

Sheffield.—October 20th. Tramways and Motor Department. 50 double-deck vestibule tramcars. (See this issue.)

Sleaford.—October 20th. Electricity Department. Cables, &c. (See this issue.)

South Africa.—Cape Town.—October 14th. Electricity Department. Electric motors.*

Southend-on-Sea.—Light Railways and Electricity Department. House-service meters and demand indicators. (October 2nd.)

Uruguay.—Montevideo.—December 22nd. State Electricity Supply Works. 200,000 metres r.i. wires and cables. December 28th. 1,060,000 metres of special cable for outside use.

November 27th. H. and l.p. cables and accessories.*

Wakefield.—October 12th. West Riding County Council. Equipment of central repair shop at Thornes, including electric motors and engineering workshop equipment. Particulars from West Riding county surveyor, County Hall, Wakefield.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Argentina.—The tender of Tilling-Stevens Motors, Ltd., for the supply of 100 petrol-electric omnibuses for service in and around the city of Buenos Aires was, *Modern Transport* states, accepted last week.

Australia.—Melbourne.—Victorian State Electricity Commission. Accepted:—

Nineteen 3,000-kVA single-phase transformers.—Johnson & Phillips, Ltd.

Barking.—Electricity Committee. Accepted:—

Motor converters (£4,950).—Ateliers de Constructions Electriques de Charleroi.
H.p. switchgear (£2,683).—A. Reyrolle & Co., Ltd.
D.c. switchgear (£3,718).—Bertram Thomas.

Tramway Committee. Accepted:—

Rails (£80).—Cargo Fleet Iron Co., Ltd.

Birkenhead.—Electricity Committee. Accepted:—

4-core l.p. cable (£3,430).—Hackbridge Cable Co., Ltd.
3-core e.h.p. cable (£1,750).—British Insulated & Helsby Cables, Ltd.
L.p. service cable (£1,085).—Liverpool Electric Cable Co., Ltd.

Bournemouth.—Corporation. Accepted:—

20 tramcars and equipment (£52,320).—Metropolitan-Vickers Electrical Co., Ltd., and the Brush Electrical Engineering Co., Ltd.—*The Times.*

Croydon.—Board of Guardians. Accepted:—

Electrical fittings and appliances for six months.—J. & T. Robinson.

Dundee.—Housing Committee. Accepted:—

Electric lighting installation at Corporation houses (£109).—Marshall, Hutton & Co.

Erith.—Housing Committee. Recommended:—

Installing electric light at 100 houses (£662).—Erith Electrical Co., Ltd. The other tenders received were: E. E. Beaven (£10 13s. 4d., or £9 16s. 9d. per house); Dean & Davis (£9 14s. per house); Electrical Supply Stores (£733); W. Dickinson & Co. (£895).

Germany.—We are informed that the Lopulco pulverised fuel system, the rights of which belong to International Combustion, Ltd., of London, is to be installed in a new boiler house of the Berlin Electric Light Works on 12 large boilers. It is understood that this order has been secured in face of exacting investigations by German engineers into all known Continental and American systems of pulverised fuel.

Hull.—Telephones Committee. Accepted:—

Cable (£101).—Union Cable Co., Ltd.
Bronze wire (£321).—T. Bolton & Sons.
Telephone cords (£82).—British L. M. Ericsson Manufacturing Co., Ltd.

Keighley.—Corporation. Accepted:—

Installation of electric lighting in 50 houses on the Broomhill estate.—Ideal Electric Co.

Board of Guardians. Accepted:—

Electrical installation at St. John's Hospital and the Central Children's Homes.—Ideal Electric Co.

Lanarkshire.—

Electric lighting installation, &c., in the operating theatre and X-ray block at the County Sanatorium, Stonehouse (£991).—Telford, Grier and Mackay, Ltd.

London.—General Post Office.—*The Times* says the Postmaster-General has placed with a British firm a large order for battery glass jars for the telephone department. An undertaking has been given that the jars will be made in this country. It is stated that the number of jars ordered runs into six figures.

Portsmouth.—Board of Guardians. Accepted:—

Electrical stores.—H. A. Evans.
Electric lamps.—Stella Lamp Co., Ltd.

Meter Contracts.—Brighouse Urban District Council, Clyde Valley Electric Power Co., and the Borough of Kirkcaldy have placed contracts for electricity meters with Edison Swan Electric Co., Ltd.

Salford.—Tramways Committee. Accepted:—

Special trackwork.—Hadfields, Ltd. (£338); Thermit, Ltd. (£441).

Health Committee. Accepted:—

Wireless reception apparatus for Nab Top Sanatorium (£145).—Marconiphone Co., Ltd.

Shipley.—Health Committee. Recommended:—

Electric light installation at smallpox hospital (£179).—G. Binns.

Stoke-on-Trent.—Corporation. Accepted:—

Wiring central power house extension (£1,068).—Hamley & Ingram.

Electricity Committee. Accepted:—

Erection of eight all-electric houses (£4,500).—Maddock Bros.
E.h.p. testing set (£119).—British Electric Transformer Co., Ltd.

Wimbledon.—Electricity Committee. Recommended:—

3,000-kW turbo-alternator (£16,499).—Metropolitan-Vickers Electrical Co., Ltd.

York.—Education Committee. Accepted:—

Re-wiring at Queen Anne School (£187).—Electricity Committee.

Forthcoming Events.

Electrical Trades Commercial Travellers' Association.—Saturday, October 10th. At the Manchester Hotel, Aldersgate Street, E.C. At 7.30 p.m. Bohemian concert.

Junior Institution of Engineers.—Tuesday, October 13th. At 39, Victoria Street, E.C. At 7.30 p.m. Paper on "Town Planning: its Effect and Influence on Industry," by Mr. R. A. Hudson
Friday, October 16th. Lecturette, "Super-Tension Cable Dielectrics," by Mr. A. J. Tracey.

Institution of Civil Engineers.—Wednesday, October 14th. At the Institution of Civil Engineers, Great George Street, S.W. At 6 p.m. Joint meeting with the bodies which are co-operating in the work of the Special Committee on tabulating the results of heat-engine trials. Discussion on "Standard Codes for Tabulating the Results of Trials on Steam Turbines and Condensing Plant," to be opened by Mr. R. A. Chattock.

Institution of Engineers-in-Charge.—Wednesday, October 14th. At St. Bride's Institute, Bride Lane, E.C. At 7.30 p.m. Presidential address by Engineer Vice-Admiral Sir Geo. G. Goodwin, K.C.B.

British Electrical Development Association.—Conferences.—Thursday and Friday, October 15th and 16th. At E.L.M.A. Lighting Service Bureau. At 7.30 p.m.

Birmingham Electric Club.—Friday, October 16th. At the Grand Hotel, Colmore Row. At 7 p.m. Lecture on "Power Factor Improvement as Affecting the Economical Running of Works Plant," by Mr. F. C. Hall.

Institute of Transport (North-Western Section).—Friday, October 16th. At Lime Street Station Hotel, Liverpool. Paper on "Electrically-propelled Vehicles for Road Transport," by Mr. F. Ayton.

Electrical Power Engineers' Association (Southern Division).—Saturday, October 17th. At the Hotel Cecil, Strand, W.C. At 5.30 for 6 p.m. Annual dinner.

National Association of Supervising Electricians.—Saturday, October 18th. At Ye Mecca Restaurant, Ludgate Hill, E.C. Dinner and whist drive.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the names of makers or suppliers of:—

Ideal electric irons.

Notes.

Perlit Cast Iron.—There is now being introduced a process for the manufacture of cast iron which would seem to be of considerable significance. The process is not new, for it has been adopted on the Continent for some time; but, so far as this country is concerned, it has been practically investigated to a limited extent for some months by the North-Eastern Marine Engineering Co., a marine Diesel engine-building concern. The patent rights in this country have been acquired by the British Perlit Iron Co., Ltd. The *Motor Ship* has examined a number of Perlit castings, and can assert that within its experience nothing of a like nature has been produced in ordinary cast-iron practice. Quite apart from the homogeneous nature of the metal, it draws attention to the fact that it has handled twisted bars of Perlit cast-iron, lengthy turnings from the metal, cold-bent strips and other items, all of which prove conclusively that the process can render possible the production of castings of an extremely high quality and possessing unique properties.

Report on a Tramway Accident.—Major G. L. Hall has furnished the Minister of Transport with a report upon a tramway accident which occurred at East Dulwich on July 31st last. The cause of the mishap was the back-running of an L.C.C. tramcar after reaching the highest point of the steepest gradient on Dog-Kennel Hill. The car collided at the foot of the hill with another which was standing there. There were 38 cases of personal injury, and a number of persons complained of shock. None of the cases was serious. It appears that the motorman inadvertently omitted to change over the reversing key before applying the magnetic brake, and so lost control of the car. Major Hall says that it is possible to obviate the necessity for changing over the reversing key before the application of the magnetic brake in the event of a run-back by an alteration in the standard connections between the armatures and fields of motors, but it is considered that the system introduces drawbacks so serious as to outweigh any advantage which may be gained.

A True Fish Story.—The *Electrical World* says that tons of dead and stunned fish recently lodged against the dam of the Interstate Public Service power house near Bedford, Ind., blocking the wheel pits and causing some of the wheels to be closed down. The entire countryside carried and hauled fish away. One fish weighed eighty-four pounds and a number weighed more than fifty pounds. Employés of the company in boats were kept working to prevent the trash racks from becoming clogged.

Industrial Heating in the United States.—According to a writer in the *Westinghouse International*, the industrial heating load in the United States now amounts to about one million kW, representing about one-tenth of the total load. This is distributed as follows:—Steel melting furnaces, 225,000 kW; brass melting furnaces, 95,000 kW; heat treating furnaces, 85,000 kW; industrial ovens, 200,000 kW; bread baking and commercial cooking, 100,000 kW; welding, 55,000 kW; and miscellaneous small units, 325,000 kW. It is stated that 95 per cent. of the japanning ovens in use in the automobile industry are electrically heated.

Electric Wiring in New Zealand: Registration of Linesmen.—A correspondent in New Zealand has sent us the following extract from *The Dominion* of August 15th, suggesting that it will give a hint to intending "wiremen immigrants" and others to the effect that unless they qualify by examination they may have to work as labourers. The same thing applies to plumbers and painters:—

New provisions for the control of electric wiring in New Zealand are contained in the Electrical Wiremen's Registration Bill. The Bill provides for the establishment of a Registration Board, consisting of five members, who will conduct examinations, issue certificates, receive applications for registration and authorise the same in cases where the conditions of registration have been complied with. An applicant may register on payment of the prescribed fee if he has received satisfactory training as an electrical wireman and is the holder of a certificate granted after an examination in both theoretical and practical wiring, or at the commencement of the Act is the holder of a certificate or licence as an electric wireman issued by an electrical supply authority approved by the Board. A further provision enables the Board to register a person who, although he is not the holder of a certificate or licence or has not passed the prescribed examination, is competent to perform the duties of an electrical wireman. A provisional licence may be granted for a period not exceeding six months to any person not qualified to be registered under the Act, and on application being made within a month of the expiry of the licence, the Board may register the person as an electrical wireman, if it is satisfied that the applicant has been employed as such for at least three years previously. Registered electrical engineers may do electrical wiring work or be appointed as inspectors, and are subject to the Board's power to suspend them for defects. The wiring of any premises for electric lighting, heating, and power purposes is to be undertaken by or under the direct supervision of a registered electrical wireman. Electricity supply authorities are empowered to appoint inspectors to inspect all wiring work before it is connected with the source of supply, and report on any defects. Complaints against inspectors' decisions by a recognised body representing electrical traders may be investigated by a competent person appointed by the Board, and if the Board is satisfied that the inspection was unfairly made, it is empowered to suspend the inspector or cancel his registration. Power is given to appeal against any of the Board's decisions, the appeal to be heard by a magistrate and two assessors. A register is to be kept, and the Board has the power to suspend licences for proved complaints of defective workmanship.

Street Traffic Signals. — A system of co-ordinating the control of cross-streams of vehicular traffic in main thoroughfares by means of electrically-operated signals is to be considered by the London Traffic Advisory Committee.

Parliamentary Acoustics.—With a view to improving the acoustics of the debating chamber of the House of Lords, preliminary tests were carried out recently with a variety of sound-producing and magnifying appliances. The apparatus was inspected by officials from the Office of Works. Tests were made with a single microphone placed on the central table of the Chamber and with headphones attached to the Lords' benches, and satisfactory amplification of voices was reported from all parts of the chamber. In some cases the speaker was located 15 ft. from the microphone.—*Daily Telegraph.*

The Ilford Cable Contract.—The recommendation of the Ilford Electricity Committee that a contract for 14 miles of cable be placed with a German company (Elec. Rev., October 2nd, p. 542) was recently adopted by the Council, and some attention has been given to the matter in the daily Press. The Council is credited with the object of breaking a "ring" of British cable-makers, and with the intention of saving money for the ratepayers. The German price is stated to be 13 per cent. lower than the lowest British tender. The *Morning Post* interviewed the electrical engineer at Ilford, and attributes to that gentleman what seems to us to be the remarkable opinion that of the total amount of money involved, £4,000, not more than some 3 per cent. would have gone in wages if the contract had been placed here. It was, he said, incorrect to suggest that the Council was opposed to the firms which constituted the Cable Makers' Association. It was, however, a singular fact that all British quotations were, within a fraction of a penny per yard, identical, and when a foreign firm quoted a much smaller figure it was bound to be accepted by the Council unless there was something radically wrong with the firm; the fact that it was a German concern could not be regarded in itself as sufficient ground for rejecting its favourable tender.

The *Morning Post* states that the action of the Ilford Council was severely criticised by an official of one of the largest firms of cable manufacturers in the country, who are members of the Cable Makers' Association. "We in England," he said "have to pay full Trade Union wages, which are at present something like 40 per cent. higher than those paid in Germany; a year ago they were over 60 per cent. higher. When the Ilford Council called for tenders for the cable in question it inserted the usual clause insisting that Trade Union rates of wages and length of working hours should be adhered to. This obviously goes by the board now that the contract has been placed in Germany. British firms are overburdened with high rates in consequence of the large number of unemployed, involving the payment of unemployment benefit and relief. Germany avoids all this by securing at lower prices contracts which should be kept in the country. It is difficult to overcome such unfair competition."

The following communication on the subject has reached us at the moment of going to Press:—

"The Ilford Council are to be congratulated on their courageous attempt to break the ring of electrical cable manufacturers by placing an order for cable with a German firm. It is interesting to note that there are ratepayers who have the common sense to see that what they might save on "doles" is more than counterbalanced by the extra prices demanded by the rings for their manufactures. There are, of course, other rings apart from cable-makers, which, in the happy position of knowing that municipalities dare not place orders abroad naturally exploit public undertakings to their own advantage. The ratepayer is thereby indirectly *subsidising the home manufacturer*, but, as usual, he has dust thrown into his eyes on the plea of unemployment. Nobody, of course, would suggest placing all orders abroad, but it is high time the community refused to be coerced by the combines in order to subsidise profiteers and shareholders. It is to be hoped that other municipalities will follow the lead of Ilford and thus help to eliminate one of the main causes of our industrial unrest."

October 5th, 1925. "Sales Engineer."

Appointments Vacant.—Electrical engineering draughtsman (£315) for the Metropolitan Asylums Board. Plumber-jointer for Precsall U.D.C. electricity department. Plumber-jointer for Salford Corporation electricity department. (See our advertisement pages to-day.)

Builth Wells Electricity Undertaking.—The electricity undertaking at Builth Wells, which was inaugurated on September 19th by Mrs. Black Jones (Electrical Review, October 2nd), is the outcome of the formation of a company under the chairmanship of Dr. Black Jones which had previously explored the neighbourhood of the town to ascertain whether water power could be utilised for generating electricity. Observations over a long period showed that the power available was liable to very wide fluctuations, and estimates of the cost proved that the expenditure of capital would be excessive. In 1924 it was decided to erect a generating station in the town, and a convenient central site was found. The power house is of steel and concrete construction. The plant includes a Ruston-Hornsby horizontal semi-Diesel oil engine driving a 40-kW d.c., 230-V generator. Provision is made for a second generating set. A switchboard supplied by the Austin Lighting Co. is equipped with pressure-regulating apparatus. A 600-Ah battery of Messrs. Pritchett & Gold & E.P.S. Co.'s manufacture is also installed. The exhaust pipe from the engine passes underneath the oil-storage tank to prevent the oil becoming too viscous in the winter. The cooling water for the cylinder jacket is pumped from a sump to an overhead tank and flows through the jacket by gravity. The distribution of current is effected by means of overhead ring mains.

Where the mains cross the lines of the Post Office, the copper cables are covered with P. B. J. insulation, thus avoiding the use of unsightly wire cradles. The steel transmission poles, which were supplied by the British Mannesmann Tube Co., are of the one-piece stepped pattern, and are made of high-tensile steel. Builth Wells is an instance of a town which is out of reach of any bulk supply, and is obliged to generate its own energy. The design and erection of the undertaking have been carried out by and under the supervision of Messrs. Moffett, Rosher & Mann, consulting engineers, Birmingham.

Nottingham's Electricity Supply.—The temporary dislocation in Nottingham's electricity supply, which took place recently, was referred to at a meeting of the City Council on Monday last. Ald. E. Huntsman, chairman of the Electricity Committee, said that the whole of the plant in the North Wilford power station was tested thoroughly before being put into service. A system of protection was provided to guard against overloading on the main cables, and it was necessary that the relay apparatus at both ends of the line should be of the same make and the same class. Plans were supplied to the men who had to carry out the work, but they failed to understand certain marks on the plans when installing the apparatus, and the omission could not be detected until the plant was put into operation. Investigations showed that that was the cause of the trouble. When the current was cut off, every effort was made to restore it as quickly as possible, and plant was put in which was not properly equipped with balancers; that was the reason for fusing in certain parts and for certain lamps being burnt out. They had got the very best plant, and they had now safely got over the transition.

Electrical Association for Women.—Lecturers have been supplied by the Association to other women's organisations, namely: For the St. John's Fellowship meeting on October 6th, at 54a, Tottenham Court Road, London, at 8 p.m. Subject: "Making the Home Electric." Speaker: Miss E. E. Wilson (member, E.A.W. Council); for the Hastings and St. Leonards Women Citizens' Association on November 20th, at 3 p.m. Public meeting on "Electricity in the Service of Women." Speaker: Miss C. Haslett (director, E.A.W.); and for the Dulwich Women Citizens' Association on December 8th, at 3 p.m. Subject: "Electricity in the Service of Women." Speaker: Alderman Mrs. Hammer (chairman, E.A.W.).

Fatalities.—At Dunfermline recently an inquiry was held into the death of an electrician employed at the power station of the Aitken Pit, Kelty, from a shock received by coming into contact with a "live." cable. An electrical engineer stated that he and the deceased had completed some work and were testing it. They found difficulty in getting the current into phase. In the course of experiments in order to find out what was wrong he heard the sound of an explosion and saw that the place was in flames. He found deceased lying on the floor. There had been some mistake in connecting up which they had not known about. The accident might have been due to deceased temporarily forgetting the possibility that the metal parts were alive, or he might have stumbled.

Questioned by the agent of the Fife Coal Company, witness stated that what was being done was a recognised operation for certain purposes, and was always associated with a certain amount of risk. None but skilled men were employed in connection with such an operation.

The Sheriff said that he did not think that it was possible to ascertain exactly how the accident happened, and without knowing that, it was impossible to make any suggestion for preventing a similar accident in the future. The jury returned a formal verdict.

A woman named Matilda Cayer, aged 68, of Rice Lane, Liverpool, who had booked an excursion ticket to Southport, fell on the electric railway at Walton Junction station on Friday last and was killed, receiving an electric shock and being struck by an incoming train.

Electrical Plant at the Southampton Docks.—In the note in our issue of September 25th (p. 506) upon the plant supplied to the Southampton Docks by Messrs. Mather & Platt, Ltd., we stated that the pumps shown provided the necessary hydraulic power for the pumps used for de-watering Nos. 1, 2, and 3 dry docks. The receiver and manager of Gwynnes Engineering Co., Ltd., which supplied the de-watering pumps, considers that our statement is misleading. He asks us to make it clear that the turbine pumps illustrated in our note actually provide hydraulic power for the operation of the sluice valves on the de-watering pumps.

The Manchester Dance.—The Manchester Electrical Engineers' Dance will be held at the Midland Hotel, Manchester, on December 4th. Information respecting the arrangements may be obtained from Mr. J. Harcourt-Williams, National Buildings, St. Mary's Parsonage, Manchester, the hon. treasurer, or from Mr. George H. Fawcus, 29, Stamford New Road, Altrincham, the hon. secretary.

National Association of Supervising Electricians.—"Economic Premiums."—Two cash prizes—one of £10 and the other of £5—are being offered to members of the Association by the president, Mr. F. Gill, M.Inst.C.E., M.I.E.E., for the best two papers dealing with economic questions. Rules have been drawn up, and papers must be received by the general secretary, N.A.S.E., not later than November 25th, 1925.

On Tuesday last, at the Junior Institution of Engineers, London, Mr. J. S. Highfield opened the new session, and called upon Mr. A. H. Dykes, in the unavoidable absence of the President, Mr. F. Gill, M.Inst.C.E., M.I.E.E., to read Mr. Gill's address. Three economic subjects were dealt with by the author. In the first place he commented on the multiplicity of patterns of accessories and materials that were used in electrical installation work, and suggested that the Board of Control of the Association should appoint a small committee to report on the subject and to make proposals for the elimination of superfluous varieties and the simplification of stocks. Next Mr. Gill referred to the prevention of accidents, and suggested that a "safety code" should be prepared with this end in view; and finally he discussed thrift, laying stress on its personal application and showing in detail the growth of savings at compound interest.

Bauxite in Hungary.—As a result of investigations carried out on behalf of the State by the Hungarian Geological Institute during the past year, special interest is said to have been evoked by the discovery of new deposits of bauxite in the Bakony and Vertes fields. The depth of the deposits is inconsiderable, and the degree of purity of the ore is declared to be greater than that of any other occurrence of bauxite. Working of the deposits is reported to have been begun already with the assistance of foreign capital.

The Norman Lockyer Lecture.—The first annual Norman Lockyer Lecture, established by the British Science Guild as a means of periodically directing the attention of the public to the influence of science upon human progress, will be given by Sir Oliver Lodge, F.R.S., on Monday, November 16th, 1925, at 4 p.m. The subject of the lecture will be: "The Link Between Matter and Matter." Lord Askwith, K.C.B., K.C., President of the Guild, will be in the chair, and the lecture will be given in the Hall of the Goldsmiths' Company. Tickets of admission may be obtained on application to the Secretary, British Science Guild, 6, John Street, Adelphi, London, W.C.2.

Institution Notes.

Institute of Transport.—On Monday last, the first meeting of the Session was held at the Institution of Electrical Engineers. Sir Lynden Macassey, the retiring president, presented the premium awards, which included the Railway Engineering Gold Medal to Major C. H. W. Edmonds, for his paper on "Modern Traffic and Signalling," and the Water Transport Gold Medal to Mr. H. J. Deane for his paper on "Modern Dock Equipment." He then installed Col. Sir Joseph Nall, D.S.O., M.P., in the chair. In the course of his presidential address, Sir Joseph said that the membership of the Institute had increased during the past year from 1,977 to 2,374. Four Local Sections were in operation, a fifth was contemplated, and the establishment of branches in South Africa, Australia, India, and South America was under way. The first Institute examination was to be held in the spring of 1926. The address dealt mainly with the question of competition between rail and road transport, and the president, referring to the maintenance of paving by tramways, expressed the view that those who were concerned in road transport must be prepared to shoulder a due proportion of the cost of providing and maintaining the roads which they used. Road transport enjoyed heavy subsidies by way of road maintenance, and the roads and railways should be placed upon a more equitable basis. If justice was to be done, the law must be amended; he suggested that tramways should receive the same grant in aid from the Road Fund as would be paid to the road authority for that part of the road if the tramway did not exist. The present practice in the matter of omnibus licensing called for early revision.

Junior Institution of Engineers.—Problems of Broadcasting.—At the opening meeting of the session, Mr. E. Bishop, B.Sc., of the B.B.C., lectured on the subject of "Problems of Broadcasting," in the course of which he referred to a microphone which was in use, of the carbon type, which was giving good results and had great possibilities for the future, being entirely free from hisses. In connection with the arrangements for outside and simultaneous broadcasting, Mr. Bishop said that, contrary to ordinary commercial practice, an unloaded land line transmitted sounds better than one which was loaded, the reason being that radio sounds covered the whole range of audible frequencies and not merely the range of ordinary speech. The wireless link had been found impossible to use for any distant relay work. Future developments would probably lead to bigger stations and fewer of them, and more American and Continental transmissions.

Institution of Heating and Ventilating Engineers.—At the autumn meeting held on October 6th, Mr. E. Ower, B.Sc., A.C.G.I., of the National Physical Laboratory, read a paper on the measurement of air flow. The author treated the subject from an engineering standpoint, confining his attention to instruments and methods suitable for industrial use. He dealt at some length with the Pitot tube, both in its usual form and with modifications, explaining the conditions to be observed in designing alternative types for use in special cases. Dealing with manometers, he described three types suitable for factory work. For all-round usefulness combined with accuracy and ease of observation, he advocated the Krell form of inclined tube manometer. Reference was also made to a tilting micromanometer whose calibration could be calculated from a knowledge of its dimensions, and to a two-liquid gauge capable of giving a magnification of about 10 to 1. The orifice plate and Venturi tube were described, attention being drawn to the facts that these instruments gave rise to considerably larger pressure differences than the Pitot tube, and that they were eminently suited to the taking of continuous records of flow. The lecturer dealt also with the construction and use of vane anemometers, the calibration of manometers, and the testing of connections and instruments for leaks. In the latter connection he emphasised the necessity for testing all rubber leads, since even new rubber tubing sometimes showed traces of porosity.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Col. Sir Joseph Nall, D.S.O., T.D., M.P., who was inducted into the chair of the Institute of Transport on Monday last, is a director of the Llandudno and Colwyn Bay Electric Railway, Ltd.

The Railway Engineering gold medal was recently awarded by the Institute of Transport to Major C. H. W. Edmonds, O.B.E., M.I.E.E., of the Westinghouse Brake & Saxby Signal Co., Ltd. Major Edmonds was a member of the Automatic Train Control and Light Signals Committees of the Ministry of Transport.

Major Basil Binyon, O.B.E., who is the new chairman of the Wireless Section of the Institution of Electrical Engineers, and whose portrait accompanies this note, was born at Ipswich in 1885. He was educated at Leighton Park School, and from there went to Trinity College, Cambridge. He took the Natural Science Tripos with distinction and the M.A. degree, and after a year of post-graduate engineering study, served a term in the shops of the Cambridge Scientific Instrument Co. He made his entry into the radio world in 1909 by joining the Lepel Wireless Syndicate, by which he was employed in the construction of a station in Jamaica. When

Elliott & Fry] [*London*

Major Basil Binyon, O.B.E., M.A.,

The new Chairman of the Wireless Section of the I.E.E.

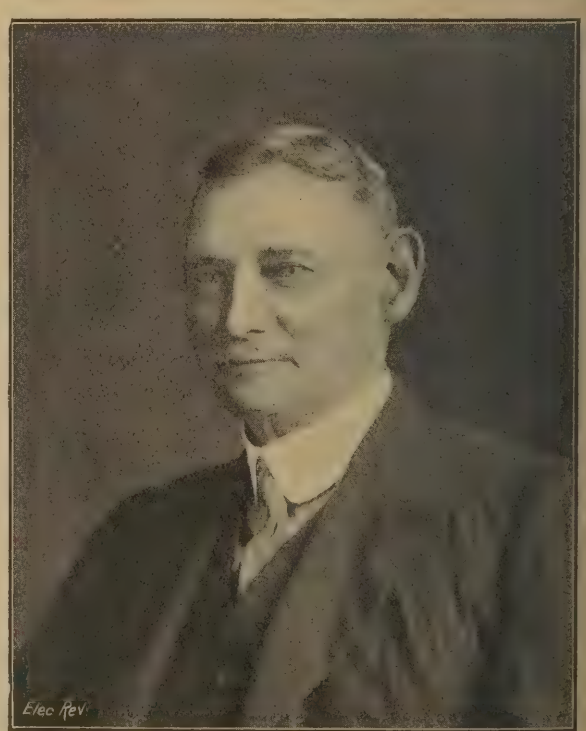
the Lepel concern was taken over by the French Cie. Générale Radiotélégraphique, Mr. Binyon was appointed research engineer. In 1911 the French company set up an English agency, and Mr. Binyon was placed in charge of it. In addition to shipping work, he erected a number of land stations, including one at Borneo and another in the Bahamas. When the inquiry into the position of radio-telegraphy in the Empire was held by a Parliamentary committee, Mr. Binyon represented his company. Upon the outbreak of war he secured a commission in the R.N.V.R., and helped in developing aircraft signalling, and, incidentally, obtained a pilot's certificate. He continued with the Royal Air Force until 1919, when the Radio Communication Co. was formed, with Major Binyon as managing director. Under his guidance this company has made rapid progress, and is now a leader in the field of marine radio-telegraphy.

The Walsall Town Council has confirmed the appointment of Captain H. V. Morland, manager of the St. Helens Corporation Tramways, as tramway manager, at a salary of £800 per annum, rising by annual increments of £25 to £900.

According to the *Sydney Morning Herald*, the Sydney, New South Wales, City Council, at a meeting on August 18th, considered a recommendation of the electricity committee that Mr. Forbes Mackay, the chief electrical engineer, be granted an increase of £1,500 per annum, making his salary £3,500, owing to his additional responsibilities in the reconstruction of the new power house. The Council declined to approve of the £1,500 to Mr. Mackay as an increase of salary, and the Lord Mayor explained to the City Council that the £1,500 was only to cover Mr. Mackay's expenses in Britain for 12 months. Alderman Marks said the Lord Mayor's statement to the Council was entirely different from his recommendation to the committee. After considerable discussion it was agreed that the £1,500 be passed as an honorarium for 12 months only. The Lord Mayor promised that the question of permanent increase of salary would be further considered when Mr. Mackay returned from London, and that he (the Lord Mayor) would make a further recommendation in regard to Mr. Mackay's expenses. Mr. Mackay was to leave for London at the end of last month for the purpose of advising British tenderers for the new power house plant, which is expected to cost approximately £1,000,000.

Mr. C. H. McCarthy-Jones, M.I.E.E., M.I.Mech.E., consulting engineer, has accepted the appointment of manager to the Indian Radio Telegraph Co., Ltd., and sails for Bombay early in November to take up his new duties. His consulting practice has been assigned to Messrs. Murray Coombs and Richards, Premier House, 150, Southampton Row, W.C.1.

The staff of the Birmingham Electricity Supply Department have presented an oak clock to Mr. R. H. Rawll, district installation engineer, on the occasion of his marriage to Miss E. Hodges, of Stoke Newington.



Mr. J. S. Smith, late manager to Sterling Telephone and Electric Co., Ltd., Cardiff, has been appointed district manager to the Marconiphone Co., Ltd., 21, Mosley Street, Newcastle-on-Tyne.

Mr. Alan W. Andrews, Glasgow, has been appointed, from 110 applicants, manager of the Corporation of Alloa electricity undertaking, in succession to Mr. D. McLennan, now at Inverness.

Messrs. W. J. Furse & Co., Ltd., of Nottingham, have taken advantage of the occasion of the opening of the electrical exhibition there to present a gold hunter watch to their superintending engineer, Mr. H. Abdy, who was largely responsible for their exhibit, in recognition of his thirty years' continuous service with the company. Messrs. Furse take some pride in the fact that they are the oldest firm of electrical contractors exhibiting.

The *Industrial Australian and Mining Standard* states that Mr. J. E. Morwood, B.E., who, during the past two years, held an important position with the Brisbane Tramways, left Brisbane on August 16th for London. Mr. Morwood obtained first-class honours at the University of Brisbane in electrical engineering, and recently has been awarded the W. and E. Hall Travelling Fellowship, which provides for two years' travel in England, the Continent and America; on his return he will lecture at the University for 12 months.

Obituary.—Captain M. H. P. Riall Sankey.—We regret to state that Captain Matthew Henry Phineas Riall Sankey, C.B., C.B.E., R.E. (Retired), passed away suddenly at his residence at Ealing, on Saturday last, heart failure being the cause. Captain Sankey was born at Nenagh, Ireland, in November, 1853, and was therefore in his 72nd year. He was a past president of the Institution of Mechanical Engineers, a member of the Institution of Civil Engineers, of the Institution of Electrical Engineers, and of the Institute of Naval Architects. He obtained his commission in the Royal Engineers in 1873 and after sixteen years in fortification and other branches of military engineering, telegraphs, signalling and other service, he retired in 1889 to become a director of Willans & Robinson (in recent years amalgamated in the English Electric Co., Ltd.). When Mr. Willans passed away Captain Sankey undertook the editing of his works on steam engine trials. He devoted a great deal of time to steam turbine and internal combustion engine design. He left Messrs. Willans & Robinson, Ltd., Rugby, in 1904, in order to take up consulting engineering work. He was very closely engaged with Marconi's Wireless Telegraph Co., Ltd., as director and consulting engineer, and he was also a director of Marconi's International Marine Communication Co., Ltd., and other Marconi concerns. He held many other directorships as well, among the companies with which he was thus connected being the Relay Automatic Telephone Co., Ltd., the Never-Stop Transit, Ltd., the Niclausse Water Tube Boiler Co., the Still Engine Co., Ltd., &c. He was a member of various engineering committees, was the

Elliott & Fry] [*London*

The Late Captain M. H. P. Riall Sankey.

author of various papers, &c., and a frequent speaker in public discussions. The funeral took place on Wednesday, October 7th, at Brompton Cemetery.

Mr. A. R. Dodge.—The death occurred in August of Mr. Austin R. Dodge, consulting engineer to the American General Electric Company. Mr. Dodge had been connected with the company for nearly 30 years, having dealt principally with turbine matters.

Mr. J. P. Lawlor, county councillor for Wicklow, who died last week at Dundrum, in that county, was a pioneer of electric lighting in the county.

New Companies Registered.

W. R. Thornton, Ltd. (208,677).—Private company. Registered September 28th. Capital, £1,000 in £1 shares. Objects: To acquire the business of an engineers' furnisher, electrical engineer and contractor and dealer in mechanical and electrical apparatus and appliances carried on by the liquidator of W. R. Thornton & Son, Ltd., of Barrow-in-Furness. The first directors are:—W. R. Thornton, Ruskinville, Dalton-in-Furness, electrical engineer (permanent governing and managing director); and A. A. Haynes, Dane Garth, Barrow-in-Furness, railway officer. Qualification of W. R. Thornton, 50 shares; of other directors, £1. Solicitor: P. K. Lee, 4, Lawson Street, Barrow-in-Furness. Registered office: 123, Ramsden Square, Barrow-in-Furness.

Kingsway Radio, Ltd. (208,759).—Private company. Registered October 2nd. Capital, £3,000 in £1 shares. Objects: To acquire the business now carried on at Cannon Street, E.C., as the "Kingsway Radio Co.," and to carry on the business of manufacturers of and dealers in wireless instruments and accessories of all kinds, photographic instruments and accessories and sports requisites of all kinds, &c. The subscribers (each with one share) are:—P. F. Hedges, The Briars, Southend Road, Hockley, Essex, managing clerk; C. W. Church, 1, Bush Lane, E.C.4, clerk. The first directors are:—H. L. Percy, W. J. Mather and C. M. Sutherland, addresses not stated. The said H. L. Percy shall be a director so long as he lives, and the said W. J. Mather shall be entitled to hold office so long as he lives and is holder of 500 shares. Qualification (except permanent directors), 250 ordinary shares. Remuneration, £150 each per annum. Solicitors: Peter Thomas and Clark, 1, Bush Lane, Cannon Street, E.C.4.

Société Genevoise, Ltd. (208,746).—Private company. Registered October 1st. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of, agents for and dealers in scientific instruments, appliances and apparatus of all kinds, electrical, magnetic, steam, hydraulic and other engines, machines, appliances and apparatus, telegraphic and telephonic appliances and apparatus, mechanical, electrical, motor and general engineers, electricians, &c. The subscribers (each with one share) are:—W. L. Custance, 41, Albert Road, W.22, merchant; H. R. White, 39, Wellington Avenue, N.15, chartered secretary. The first directors are:—F. Turrettini (permanent) and W. L. Custance. Solicitors: Bate & Co., 35, Bedford Row, W.C.1. Registered office: 95, Queen Victoria Street, E.C.4.

Winchcomb Electric Light and Power Co., Ltd. (208,731).—Private company. Registered October 1st. Capital, £6,000 in £1 shares. Objects: To carry on the business of an electric light and power supply company. The permanent directors are:—J. Atkins, 59, Church Street, Tewkesbury, electrical engineer; R. W. W. Edwards, Cleve Hill, near Cheltenham, hotel proprietor; W. C. Hands, 195, North End Road, West Kensington, W.14, electrical engineer; W. E. C. Hutchings, North Fanncote, Winchcomb, farmer; and H. W. Stephens, Winchcomb, solicitor. Qualification, £50. Secretary and solicitor: H. W. Stephens, Winchcomb, Glos.

Quickfix Electrical Fittings Co., Ltd. (13,822).—Private company. Registered in Edinburgh September 28th. Capital, £10,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in all apparatus, fittings, fixtures and accessories in connection with electric and gas lighting and power, &c. The directors are:—J. Coggans, 154, George Street, Glasgow, manufacturer; H. Patrick, 15, Mair Street, Plantation, Glasgow, wine and spirit merchant; G. U. Scott, 95, Renfield Street, Glasgow, picture house director; and J. McLean, 12, Woodside Terrace, Glasgow, commission agent. Qualification, 200 shares. Registered office: 33, Bath Street, Glasgow.

Neron Lamps, Ltd. (208,763).—Private company. Registered October 2nd. Capital, £5,000 in £1 shares. Objects: To carry on the business of engineers, electrical engineers, electricians, suppliers of electricity, manufacturers and vendors of electric lamps, &c. The subscribers (each with one share) are:—L. F. Szilagyi, 16, Helenslea Avenue, N.W.11; J. A. Milne, 82, Hazelwood Lane, Palmer's Green, N.13, chartered secretary. The directors are:—R. T. Durran, address not stated; C. P. Jenson, address not stated; L. F. Szilagyi, 16, Helenslea Avenue, N.W.11 (director of Siemens-Schuckert (Great Britain), Ltd.). No share qualification required. Solicitors: Nicholson, Graham and Jones, 19-21, Moorgate, E.C.

Impex Electrical, Ltd. (208,707).—Private company. Registered September 30th. Capital, £2,000 in £1 shares. Objects: To carry on, in the U.K. or elsewhere, the business of importers, exporters, manufacturers, salesmen, factors, brokers and suppliers of, agents for and dealers in wireless and electrical instruments, apparatus, accessories, machines and materials of all kinds capable of being used in connection with electricity, radio or wireless telegraphy, telephony or telephotography, &c. The subscribers (each with one share) are:—M. Franses, 5, Granville Mansions, Shepherds Bush, W.12, merchant; S. Franses, 28, Queen's Road, Bayswater, W.2, merchant. The first directors are not named. Solicitor: H. A. Lawrance, 13, Hanover Street, W.1.

Official Returns of Electrical Companies.

Brookhirst Switchgear, Ltd. (175,995).—Return dated December 31st, 1924 (filed April 20th, 1925). Capital, £550,000 in £1 shares. 126,002 shares taken up. £30,502 paid. £95,500 considered as paid. Mortgages and charges, £25,000.

Tisbury Electric Supply Co., Ltd. (176,539).—Return dated May 21st, 1925. Capital, £6,000 in £1 shares. 5,000 shares taken up. £5,000 paid. Mortgages and charges, nil.

Gayton Park Electricity Co., Ltd. (184,208).—Return dated April 6th, 1925. Capital, £3,000 in £1 shares. All shares taken up. £3,000 considered as paid. Mortgages and charges, nil.

J. Hadden & Co., Ltd.—J. E. Percival, of 6, Old Jewry, E.C.2, ceased to act as receiver or manager on September 17th, 1925.

C. J. Thursfield & Co., Ltd.—Second mortgage debenture dated September 16th, 1925, to secure £500 charged on the company's undertaking and property, present and future, including uncalled and unpaid capital. Holder: R. S. C. Jamie, 106, Trafalgar Road, Moseley, Birmingham.

Yeovil Electric Light and Power Co., Ltd. (186,456).—Return dated May 25th, 1925. Capital, £10,000 in £1 shares. All shares taken up. £10,000 paid. Mortgages and charges, nil.

Barrett & Morris, Ltd.—Satisfaction in full on May 24th, 1925, of debenture dated July 25th, 1924, securing £100. (Notice filed September 23rd.)

Newton Brothers (Derby), Ltd. — Particulars filed of £50,000 debentures authorised September 16th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Bordesley Electrical Accessories Co., Ltd. (176,962).—Return dated November 21st, 1924 (filed April 24th, 1925). Capital, £5,000 in £1 shares. 4,662 shares taken up. £2,350 paid. £2,312 considered as paid. Mortgages and charges, £500.

Resisto Electric Wire and Tape Co., Ltd. (176,804).—Return dated January 13th (filed March 21st), 1925. Capital, £500 in £1 shares. All shares taken up. £500 paid. Mortgages and charges, nil.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Agricultural and General Engineers, Ltd. The report for the year ended March 31st last states that the depression in the home and foreign markets continued to have an adverse effect upon the affairs of the constituent companies, but an improvement was shown and this is continuing. The combined accounts show a manufacturing profit of £406,963, as against £362,806, and the profit carried down rose from £78,697 to £111,624. The gross profit of the parent company was £44,100, and after deducting expenses a balance of £379 remains, as compared with £6,884 in the previous year. The addition of the amount brought forward leaves £10,861 to the credit of the revenue account. The meeting is to be held on October 16th.

Western Electric Distributing Corporation, Ltd. The report for the year ended June 30th shows a net profit of £7,938; to this is added £915 brought forward, making £8,853. It is proposed to pay a final dividend of 5 per cent., making 8 per cent. for the year (as compared with 10 per cent. in 1923-24), to transfer £1,750 to reserve, and to carry forward £751. The issue of 20,000 ordinary and 20,000 six per cent. cumulative preference shares of £1 each has been sanctioned. The ordinary shares are being offered at par and the preference shares at a premium of 5s. 6d. to existing shareholders.

Falkirk Iron Co., Ltd. The directors propose to issue a new series of 6 per cent. debentures to replace the existing 8 per cent. first mortgage debentures now outstanding. It has been decided to limit the issue to £130,000. The new debentures will mature in 1945, when they will be repaid at par unless they have previously been redeemed by the operation of the sinking fund. Commencing in 1935, an annual drawing will be made, or they will be purchased in the market, to the total of £6,000 per annum. The holders of the existing 8 per cent. debentures will have the option of converting their holdings into ordinary shares at the price of 25s. per share, or into the new debentures.

Swiss Companies. The accounts of the Bank für Elektrische Unternehmungen, of Zurich, for 1924-25, including the amount of 256,000 fr. brought forward, show an available surplus of 5,033,000 fr., as compared with 4,174,000 fr. in the previous year. It is proposed to pay a dividend at the rate of 8 per cent. on the A and B shares of the corresponding nominal amount of 500 fr. and 50 fr., and to place 500,000 fr. to the special reserve fund.

The directors of the Maschinenfabriken Escher, Wyss and Company, of Zurich, report net profits of 635,000 fr. for 1924-25, as compared with 493,000 fr. in the previous year, and propose to pay the statutory dividend of 8 per cent. on the preference shares, while no distribution is to be made on the ordinary shares, which received 4 per cent. in 1923-24. The passing of the dividend on the latter is due to the desire to strengthen the working funds owing to the existing keen competition. During the past year it was only possible to obtain normal activity at very depressed prices, and the results were also prejudiced by a strike extending over two months.

French Companies. The directors of the Electro-Métallurgie de Dives report net profits of 9,055,000 fr. for 1924-25, as compared with 5,535,000 fr. in the previous year. It is proposed to increase the rate of distribution from 70 fr. per share in 1923-24 to 80 fr. for the past year.

The Société des Accumulateurs Electriques (formerly A. Dinin) reports a large increase in the gross profits for the year 1924-25, the net profits and balance forward amounting to 3,782,000 fr., as compared with 1,891,000 fr. in the previous year. It is proposed to pay a dividend at the rate of 18 fr. gross per share, as against 12 fr. in 1923-24.

La Société des Accumulateurs Dinin, of Paris, reports a profit of 13,421,052 fr. for the financial year 1924-25, as compared with only 12,526,315 fr. for the preceding 12 months.

German Companies. The Electricity Company (late W. Lahmeyer) reports net profits of 1,593,000 marks for 1924-25 and a dividend at the rate of 8 per cent. on the ordinary shares.

The Poege Electricity Company, of Chemnitz, has decided to carry forward the loss of 36,000 marks incurred in 1924-25 owing to unfavourable sale prices and high taxes and social burdens.

Kaministiquia Power Co.—At a meeting on October 1st the shareholders ratified the scheme for the sale of the company's assets to the Fort William Paper Co. mentioned in our issue of September 25th (p. 509).

Polish Companies.—The Société d'Entreprises Electriques en Pologne, of Brussels, is increasing its capital from 10 to 20 million francs.

Company to be Struck off the Register.—The name of the undermentioned company will be struck off the register at the expiration of three months unless cause is shown to the contrary :—

Witchell's Electrical Accessories, Ltd.

Browett, Lindley & Co., Ltd.—It is not proposed to pay any interim dividend on either the preference or ordinary shares.

Stocks and Shares.

Monday Evening.

Four p.c. is a very useful Bank Rate for trade and finance alike. Its establishment last Thursday proved to be another pleasant surprise to the Stock Exchange. Although a reduction had been previously anticipated, its announcement was not expected when it actually came, for money market conditions hardly warranted the alteration, so far as the layman could discern. In explanation, the theory is advanced that the Bank Rate has come down on political reasons; in other words, that the Treasury is anxious to do everything possible in order to stimulate national trade and industry.

The immediate effect was to lead to a strengthening of prices in the gilt-edged section. Investment issues of all kinds went better. A premium of 2s. was bid for the new County of London preferences. Debenture stocks have become harder to find than ever. There happens to be on offer at the moment a modest amount of General Electric 7 p.c. debenture at 104¼. The price would stand higher were it not for the fact that the company has the right to redeem the stock at 100 in 1931, if it cares to exercise this option. Moreover, there is a sinking fund, now in operation, for repayment of a certain amount of stock every year at par.

The only noticeable change in the prices of London electricity supply shares is ⅛ rise in St. James and Pall Mall ordinary, to 14⅞. Charing Cross preference are rather better. In the provincial list of ordinary shares, Bournemouths have receded to 58s. 9d. Bromley (Kent) are 34s. 6d., Folkestone 39s. 6d., Oxford 5⅛, Isle of Thanet 17s., and Llanelly 19s. 9d. Of the Colonials, Victoria Falls ordinary keep good at 48s. 3d., the preference being 32s. Amongst the foreign stocks, Mexicans tend to droop. Reversion to Greenwich mean time had no influence over illumination shares. Gas stock went a little easier.

Home Railway issues have been rising and falling with the capriciousness of a barometer. At the Liverpool Labour Congress, the Communists received such snubs that the Home Railway market plucked up heart, and substantial rises were secured. Then came the week-end hints of N.U.R. trouble, and some of the previous gains became lost. Metropolitans show on balance a rise of 4 points at 68½, and Districts are 3 up at 44½. Underground Electric Railways £10 shares have strengthened to 2¼ and the Income bonds at 97 stand 2 points higher at 97. The market lacks the power to attract the public, however, and prospective purchasers are startled by any shadow of Labour disturbances.

Considerable business is being done in the new shares of the United River Plate Telephone, the price of which is 35s. premium. The old shares, at 7, are ex rights. Chili Telephones have risen to 5⅝. Cable stocks are dormant; there is little interest being taken in them at present. Great Northerns show a 5s. rise. Wireless shares have the public interest in Canadian Marconi as the feature of their market. The price touched 7s. before reacting to 6s. 9d. Radio common and preferred are both very quiescent.

Brazilian Tractions dipped to 72½, and rallied to 74 bid. Anglo-Argentine Tramways 5 per cent. debenture is in request at 76. Rio Tramways firsts rose to 96½, the seconds to 86½. Of dollar stocks, Shawinigan Water Common improved to 167½. British Electric Traction ordinary is better at 121.

Siemens are a hard market at 28s. 9d. The price drooped to 27s. 6d., but was quickly restored to its previous level. Metropolitan-Vickers are a florin down. Electric Constructions shed 1s. 6d. Edisons have gone back to 8s. Cable Construction issues are dull. The reason given in the market is that holders have been selling these in order to meet their obligations in the rubber share market. This is a factor which does duty in every Stock Exchange department that exhibits dullness nowadays. The roar of the rubber boom is heard in the land; the world and his wife are bent—especially the wife—upon making easy fortunes out of rubber shares. To finance the purchases, stocks and shares of other kinds have been sold. The dullness of engineering and similar issues has a more direct cause in the postponement by Armstrongs of the interim dividend payments upon the company's junior preference shares. Babcocks are 50s., and are unchanged on the week.

The Berlin Wireless Exhibition.

Some Impressions of a Visitor.

THERE were certain aspects of the large Exhibition held in the Berlin Radio Hall this year which reminded us that the more energetic type of British wireless manufacturer is by no means confined to his home market, but that on occasion he can carry the war into the enemy's country with effect. The English visitor on arriving at the exhibition would particularly notice that one shop window almost next to the Hall was crowded with a comprehensive range of Amplion loud speakers. In the hall itself, he would observe that one

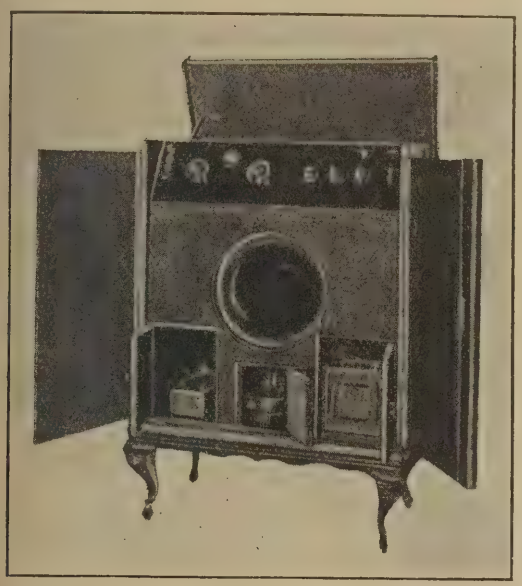

Fig. 1.—A German Set incorporating a Brown Loud Speaker.

German maker exhibiting a range of high-class cabinet receivers of the 8-valve type had adopted the Brown loud speaker as being the best obtainable for the work (fig. 1); this was the Radiotechnische Werke, and the familiar name on the loud speaker was one of the first things which attracted attention to the sets. In the hall, too, was to be noticed a very comprehensive exhibit of Clix (fig. 2), all the three makes in question being widely known in Germany.

The Radio Hall, in which the Exhibition was held, is a huge structure with a floor area of some 80,000 square feet, was hardly large enough for the exhibits and the large attendance. During the course of the exhibition (to 1st December, some 200,000 people visited the hall, and the public interest in wireless shows no sign of abating this year. At any rate, the crowds in the building were the reverse of pleasant after half-past eleven each day, and it involved a struggle to examine the exhibits after that hour. Apart from the crowd, however, the reception arrangements for foreign visitors were unequally thorough. The amusement side of the Exhibition had also received great attention. Loud-speaker installations throughout the hall distributed music during the day, and a small theatre seating some 500 people was arranged in a minor hall of the building, where a typical broadcast farce (complete with chorus) was given several times daily to crowded houses. The exhibition building, too, with its open-air restaurant and its situation near the beautiful Grunewald, could hardly have been better adapted to its purpose.

The Deutsche Reichspost (German Post Office) had an interesting exhibit on the gallery of all the apparatus of a typical transmitting station, including a small radio, as well as a number of typical receiving instruments from a 7-valve down to a 2-valve, these sets being shown unboxed, while large and well-executed drawings of the circuits were mounted on the wall behind each instrument to enable the visitor to follow its construction, as seen in fig. 4. The connection between the German Post Office and the wireless industry is, of course, much closer than in this country, for in addition to supplying the equipment of the transmitting stations, it is also a large shareholder in each of the broadcasting companies, and exercises a very great measure of control quite apart from its power in the way of regulations.

The competition of German-made telephones has always been an extremely marked feature of the English trade ever since the early days in 1923, when makers were startled to find their home market flooded with German headsets, all duly stamped B.B.C., in spite of the so-called prohibition of the use of imported sets. Since then so many thousands of them have been unloaded in this country at cut prices that English makers have of late been considering an application for this essential branch of the wireless trade to be protected by the Safeguarding of Industries Act. It is evident from an inspection of the Berlin Exhibition that this competition is still keen, and it was quite easy to obtain telephones in fairly small lots at prices in the neighbourhood of 5s., which confirms (if any confirmation were needed) the complaint recently made by Mr. Hooker, a director of Messrs. C. A. Vandervell, Ltd., that many German-made telephones are supplied below the English cost of production. Many makers represented at the Berlin Exhibition claim to be exporting their headsets in thousands to England without any trade mark. Though German production costs show an upward movement, the telephone makers are doing everything in their power to retain their hold on the trade by cheapening the construction, but this policy seems now to have been carried to excess, and it is hardly probable that any worse competition in telephones will be experienced than hitherto.

The average amateur, on the other hand, has for many of his requirements to pay a higher price than in England. It is, for instance, seldom that a piece of crystal can be obtained for less than 1s. 6d., while the detector portion arranged to plug in to the set in very

Fig. 2.—A familiar English Accessory.

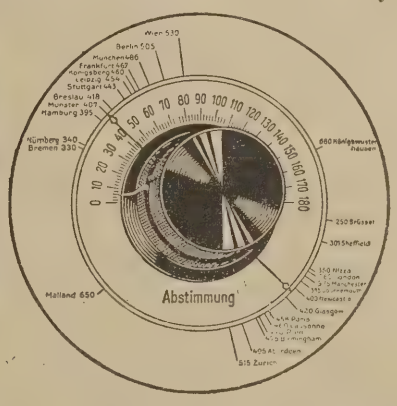

Fig. 3.—A German Dial.

much the same way as a valve costs 6s. or 7s. Further, his various accessories in the way of aerial, batteries, accumulators, &c., are usually higher in price than the amateur is accustomed to pay in this country.

In sets, there is a steadily increasing improvement over previous years, and most of the valve instruments on exhibition were quite up to date in the employment of reaction, which had previously been forbidden by the regulations. One of the most noticeable features of the sets was the way in which the use of ebonite was avoided, and in fact everything possible was done to cut down the cost of construction of most of the instruments shown. Examples of sets in elaborate "period" furniture were rare compared with what is usual at an exhibition in this country. In spite of this, however, the sets on view presented, on the

whole, a very attractive and uniform appearance, with their dead-black and plated finish. One of the small features which mark the average German instrument is the increasing adoption by many makers of very elaborately engraved 5-in. diameter fixed dials, these

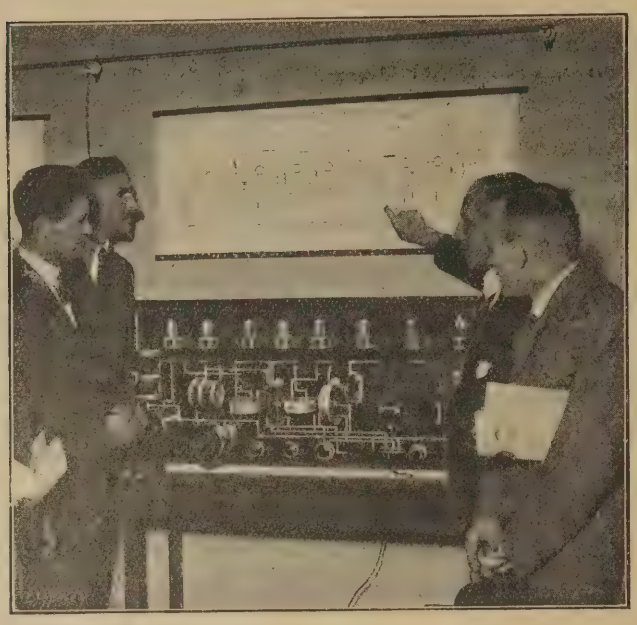

Fig. 4.—Part of the German Post Office exhibit.

being sometimes merely calibrated in degrees on the upper half, leaving space on the lower half for the user to mark his own readings; other makers have the dial engraved with both the wave lengths and the name of every station which the apparatus will receive at t exact spot where the pointer should be set. One tempted to wonder, however, what sort of corre tions will be required when the instrument is eventual installed some two or three hundred miles from t place where these settings were originally obtain and when, in addition, the user has exercised the usu privilege of varying the length and direction of h aerial and making the other little changes which a customary.

The home construction of sets has in the past be practically forbidden by the regulations, or, at a rate, only allowed in the case of members of one other of the recognised amateur clubs, but it will n rapidly come into favour with the abolition of the restrictions from September 1st. On the stand of o of the principal makers of parts they had the hap idea of installing a boy of 14 at a bench in the fro of the stand, who was continuously occupied in buildi up instruments from the various components exhibite and showing how rapidly these could be made up. T removal of the restrictions, too, has brought forwa a big variety of publications for the amateur, and one stand in the gallery a publisher was exhibiti dozens of different cheap handbooks priced at 1s. a 1s. 9d. each, together with a specimen of each instr ment described, which had been built by different me bers of amateur clubs. The clubs, such as that org nised by the "Sendung," and the Deutscher Fu Technische Verein, also had stands, on which were sho models of the sets built by their members, complete wi well-executed drawings.

It is estimated that the total attendance at the exhi tion during the time it was open from September 4 to the 13th was about double last year's figure.

New Electric Fires.

Designs for the Coming Season.

(*Continued from page* 534.)

Belling & Co.

A rather novel form of imitation coal fire (fig. 14) is included among several new designs which this firm has put on the market. A wrought-iron brazier measuring 24 in. high, 16½ in. wide, and 8½ in. deep is packed with imitation coal illuminated by a concealed amber lamp. Fitted in the front of the brazier are two 1-kW fire bars with separate switches. The bars are of the firm's standard "Multi-Parabola" type; this form of bar has 75 small parabolic wells which, it is claimed, throw the maximum amount of heat forward. The bar is curved to

Fig. 14.—The Belling "Pillar" Fire.

Fig. 15.—The "Belling" Dome Fire.

give a wider distribution. The fire is mounted on four legs, the front pair taking the form of square columns. Four finishes are available.

Another new "Belling" fire is that shown in fig. 15. This is a low-priced model made of sheet steel, the ornaments being of solid cast brass finished in bronze. The top is domed and perforated, and is so arranged that kettles, &c., can placed upon it. The fire is fitted with two separately-switch "Multi-Parabola" 1-kW elements, and is given a black a bronze finish.

Bastian & Allen.

The fires manufactured by this firm are distinguished the well-known "Quartzalite" element, in which the w is wound in or upon quartz tubes, raising the latter to a so red glow. Among the season's designs is the "Salisbury type shown in fig. 16. This has an attractive appearan being finished in oxidised copper. Behind the elements is polished copper reflector which can be readily removed cleaning. The dimensions are:—Height 15 in., width 17 i

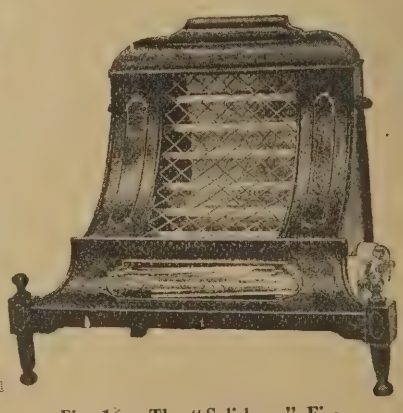

Fig. 16.—The "Salisbury" Fire.

Fig. 17.—The "Quart Adam Fire.

and depth 9 in. The loading can be anything between 1 a 2 kW.

Another "Quartzalite" fire is the "Adam" pattern (f 17). This also can be arranged for from 1 to 2 kW. T finish is oxidised silver, and the fire is 15 in. wide a 18 in. high.

H. W. Sullivan, Ltd.

One of the new fires produced by this company is the "utility" design, illustrated in fig. 18. This, the "Adapta" fire, is equipped with a movable 750-W element which, by means of a small lever, can be turned from a vertically-sloping position into the horizontal position in which it is seen in the illustration. Thus the fire can be used for ordinary heating purposes or for boiling a kettle. The model is finished in black enamel with nickel-plated relief. Its height is 12½ in., width 11¼ in., and depth 6½ in. Another new Sullivan design is the "Adjusta" fire (fig. 19). This, it will be observed, is so mounted that it can be swung and fixed in any position. Two "Uniglow" elements, each of 1,000-W loading, are fitted, and the case is of cast-iron and sheet-steel finished in black enamel with aluminium reflectors and nickel-plated mounts. The dimensions are:—Height 20⅜ in., width 15 in., and depth 9½ in.

Metro-Vick Supplies, Ltd.

Included in the new designs put forward by this company is a new model of "Cosmos" bowl fire (fig. 20). This is similar to the original pattern in general arrangement; the reflector is of hammered copper, 12 in. in diameter. Fig. 21 shows a new cast-iron model of the "Cosmos" radiant fire which has been produced to meet the demand for a light fire for municipal hiring schemes. A new type of element (2-kW) is fitted; the backplate hinges down, and the elements can be replaced in a few minutes. The fire has an oxidised copper finish. A third design is the Jacobean "Cosmos" fire, illustrated in fig. 22. The heating element consists of two 1-kW bars, each composed of a cylinder of special refractory material on which the resistance wire is tightly wound. The whole element bar attains the same degree of red heat as the resistance wire.

Fig. 18.—The Sullivan "Adapta" Fire.

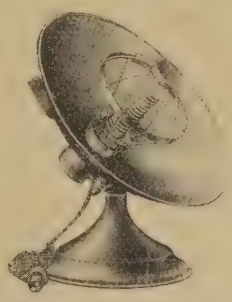

Fig. 20.—New "Cosmos" Bowl Fire.

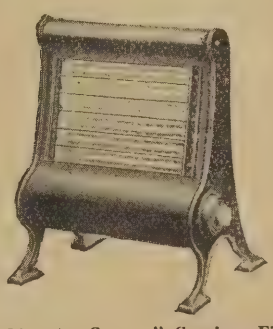

Fig. 21.—A "Cosmos" Cast-iron Fire.

ig. 19.—The Sullivan "Adjusta" Fire.

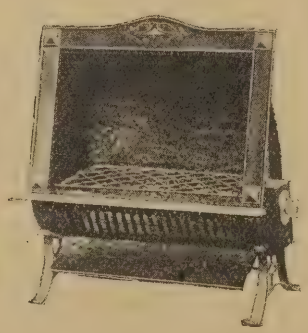

Fig. 22.—A Jacobean "Cosmos" Radiant Fire.

Each bar can be replaced quickly by unscrewing a wing nut at each end.

Siemens and English Electric Lamp Co., Ltd.

This company handles the "Xcel" domestic appliances made by the Automatic Telephone Manufacturing Co., Ltd. In a recently-issued booklet a number of new designs of "Xcel" fires are illustrated; we have selected two of them for mention. One (shown in fig. 24) is a "well"-type fire, in which the elements are mounted horizontally in a recessed base; a curved polished-copper reflector throws the heat forward, while there is also a certain amount of direct heat projected through openings in the base. There are four 600-W elements, and these are plugged into special sockets at the sides and are easily replaced. The fire has an art-black finish and measures 19½ in. by 21 in. by 10½ in.

The other (fig. 23) is a bowl-type heater—the "Fulray." It has a plug-in element similar to those used in the first-mentioned fire with a loading of 600 or 1,000 W. A carrying handle is provided, and the bowl can be tilted and fixed in a horizontal position. The base can be either black or bronzed.

Jackson Electric Stove Co., Ltd.

Among the new season's models made by this company is the "No. 589" design depicted in fig. 25. This is a development of the "Cheery" fire, and, like that model, has a polished back reflector, broken up into horizontal sections, with the element (1.5, 2, or 3 kW) arranged at the base. The depth is sufficient to permit a 2-pint kettle to be placed over the element on a swing-over trivet. A number of finishes are provided.

Fig 23.—The "Fulray" Bowl Heater.

Fig. 24.—An "Xcel" Well Fire.

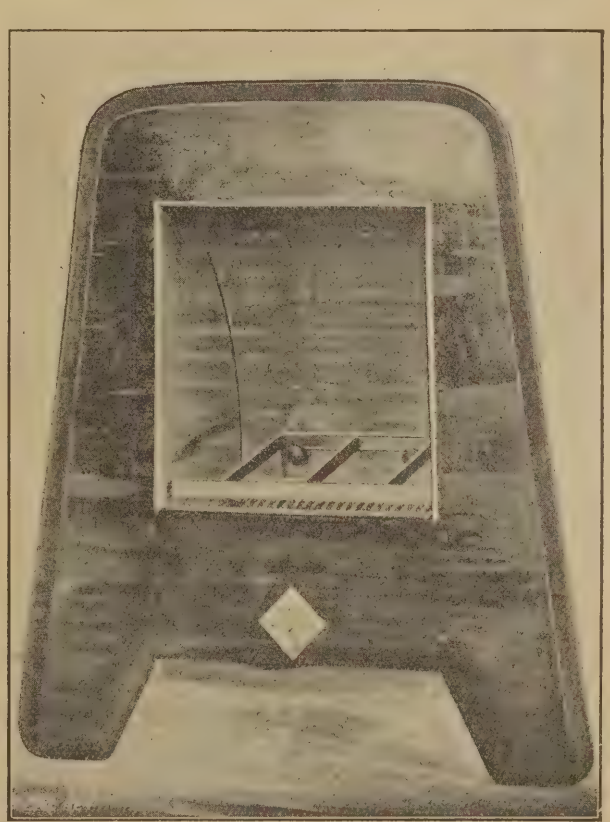

Fig. 25.—The Jackson "No. 589" Fire.

Berry's Electric, Ltd.

This company has put forward two new designs of "Magicoal" fires, of which Mr. Berry was the originator. One of these is a Queen Anne model. This fire has a 3-kW loading with a controlling switch. The dimensions are: Height 26 in., width 34 in., depth 20 in., and the body has a plated steel finish.

The company has also placed on the market the "Mulparvo" utility heater (fig. 26), which can be used either as a fire,

placed on end or horizontally, or as a small cooker. The element is loaded at from 600 to 1,000 W, and it is easily removed

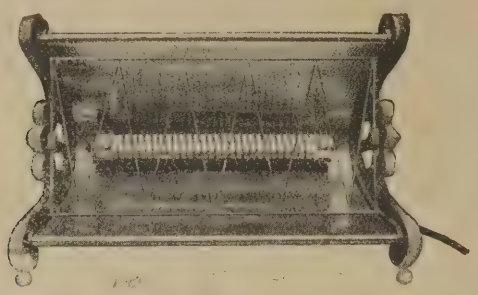

Fig. 26.—The "Mulparvo" Utility Heater.

for replacement. Oxidised copper and silver finishes are available.

(To be continued.)

Church-Bell Ringing by Electricity.

The Autosonneur.

The following is a brief description of an interesting method of ringing church bells by electricity, which has recently been patented by Mr. F. Wust and put on the market by the French firm of Messrs. Wyss & Cie., who are represented in this country by Mr. Paul Diény. The installation comprises a small electric motor, fig. 1, working in conjunction with a special device by means of which the rotary motive power of the motor is only imparted to the bell on its upward stroke. The motor drives the apparatus by means of a belt, provided with a jockey pulley, working on a flywheel loosely mounted so that it normally runs free on a main shaft. On one end of the latter is a sprocket on which works a length of pitch chain, the ends

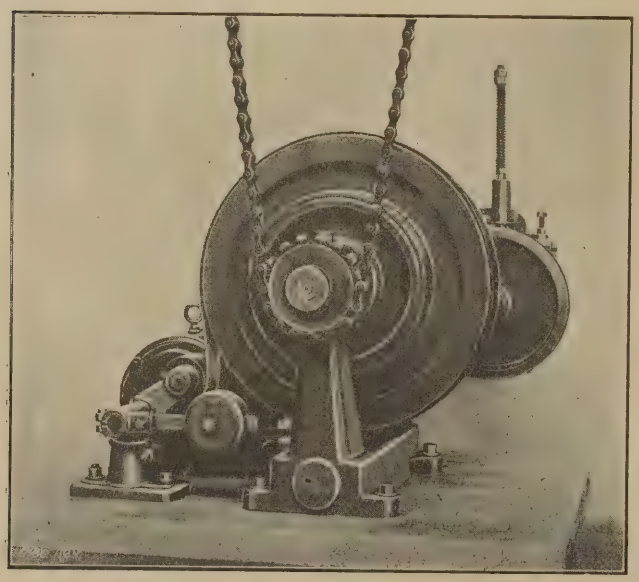

Fig. 1.—Bell Ringing Device.

of which are connected to a light steel band running in a grooved pulley secured to the bell arbour. At the opposite end of the shaft is a pinion and spur wheel, connected with an automatic gear, by means of which a clutch is automatically disengaged on the completion of the upward stroke of the bell. The female portion of the clutch is built up as part of the flywheel, while the male part is secured to the shaft on which the sprocket is mounted. On the completion of the upward stroke, the bell in its descent reverses the motion of the steel band and chain; this by the medium of suitable mechanism brings into action a brake band on a drum, connected with which is a system of levers by means of which the clutch is disengaged. As soon as the bell reaches its lowest position and has again to be lifted, the brake band is released, allowing the clutch to be once more engaged, and the power of the motor to be imparted to the sprocket. Thus while the flywheel runs continuously in the one direction the shaft carrying the sprocket reverses at each oscillation of the bell, disengaging the clutch on the downward stroke, and engaging it on the upward one. Cam adjustments are provided whereby the degree of bell oscillation can be varied as desired.

Another ingenious part of the apparatus is a pulley driven by a belt off the flywheel boss by means of which the clutch is automatically held in the disengaged position when the bell is not in use or when, if necessary, it is desired to ring it by hand. Connected with the pulley is a small drum to which is secured a leather strap and weight. To stop the bell ringing it is only necessary to switch off the current. The machine then continues to be driven by the bell—the clutch being still automatically engaged and disconnected—this giving rise to a braking action which quickly brings the bell to a stop. During its final oscillations there comes a period when the flywheel turns slightly in a reverse direction; this has the effect of raising the jockey pulley which frees the pulley, allowing the weight to fall, so disengaging the clutch and bringing into action a lever which retains it in that position. Conversely, the first action on starting the electric motor for bell ringing is to automatically raise the weight, so permitting the clutch to be engaged and disconnected by the automatic gear.

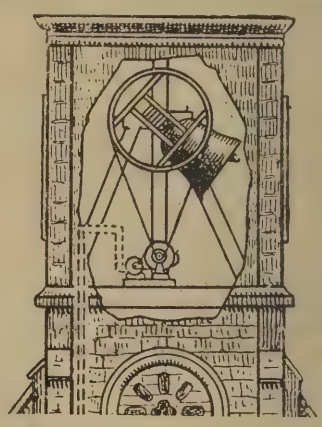

Fig. 2.—Installation in Belfry.

As usually arranged the motor and "Autosonneur"—the name by which the device is known—are located in the belfry (fig. 2), and the bell can be run at any time by the simple movement of a switch in any convenient part of the church, thus rendering bell-ringing independent of expert ringers. A separate motor and gear are necessary for each bell, but it is claimed that owing to the compactness of the gears, these can be readily installed and that the energy consumption is very small, the cost being only a few shillings per year per bell. Furthermore, being entirely automatic, it is claimed to require no more attention than occasional lubrication. Quite a number of churches in France have, we understand, already been fitted with the electric bell-ringing arrangement, among them being the Cathedrals at Troyes and Dole.

The Import Trade of China.

The following table shows the value of China's imports in 1924 of material of interest to the electrical and allied trades, indicating the principal countries of origin. The figures for 1923 are given in comparison, and notes of increases or decreases are added. It is probable that the trade credited to Hong-Kong was to a fair extent transacted with the United Kingdom.

The Haikwan tael = 3s. 7 15/16d. in 1924 and 3s. 5¾d. in 1923.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

The "Pelican Univernier."

A useful knob and dial substitute for the ordinary dial on the shaft of a condenser, variometer, or rheostat is marketed by Messrs. Pell, Cahill & Co., Ltd. It gives one very close control of such instruments, the mechanism being so designed that the speed of rotation of the knob is 12 times that of the shaft. The "Pelican Univernier" is made of moulded "Eboneum," and can be easily fitted to any existing condenser shaft without having to drill the panel; one hole only is needed for fixing.

A New Crystal Receiver.

The "Lowke Dane Tree" crystal receiving set which has been placed on the market by Messrs. Lowke & Sons, Ltd., is complete for reception on all wave-lengths of the British Broadcasting Co.'s band, including the high-power Daventry station, without the use of any plug-in coils. The set is enclosed in an oak cabinet, fitted with a hinged lid, the panel fittings being nickel plated. The detector is provided with a fine screw and push adjustment and it is set at an angle which is said to assist vision and manipulation.

The "Clearer Tone" Valve Holder.

An anti-microphonic valve holder has been placed on the market by Messrs. Benjamin Electric, Ltd. The component is made of bakelite, and is designed to minimise the transmission of outside noises and vibration to the valve filament, the valve being "floated" on springs which have one turn only, and themselves form the valve-pin sockets; thus each is a solid piece of metal from the tag to the valve leg with no soldered joints or wire connections. As shown in fig. 1, the holder is four-cornered, and terminals are provided at the

Fig. 1.—An Anti-microphonic Valve Holder.

corners, in addition to soldering tags for use in the case of a permanent fixture.

A Battery Switch.

A neat and effective little radio battery switch is marketed by Messrs. Benjamin Electric, Ltd. Fig. 2 will indicate its action; "it's off when it's in," and a sharp straight tug is

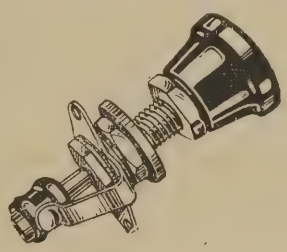

Fig. 2.—A Benjamin Push-pull Switch.

needed to establish contact, hence accidental switching is avoided. The simple single contact makes the device reliable, and it is easy to fix, one hole only being required, and there is but one locknut to adjust.

"Reco" Batteries.

Two interesting types of battery are being placed on the market by the Radio Equipment Co., Ltd., for use with broadcast wireless apparatus; they are also suitable for other purposes, of course. The high-pressure battery is unusual in that it is re-chargeable; as shown in fig. 3, plug sockets clearly

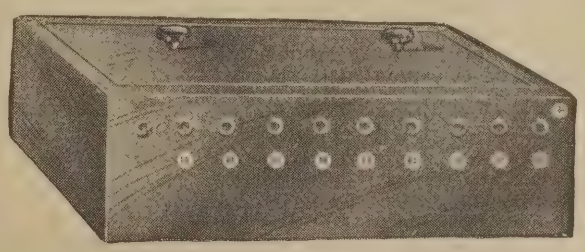

Fig. 3.—"Reco" Re-chargeable High-pressure Battery.

marked in voltage steps are arranged along one side of the box and the dimensions of a 60-volt battery are 5¾ by 9¼ by 3 in. and its weight is 6 lb. It is claimed that they are unusually noiseless and that they do not deteriorate when not in use. Bat-

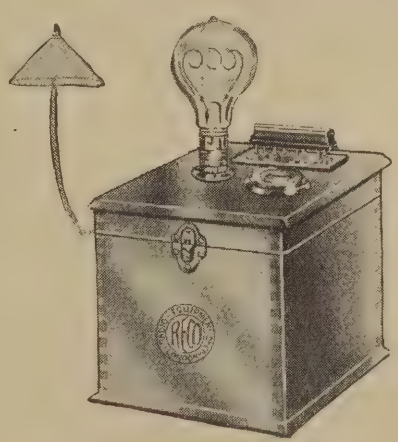

Fig. 4.—"Reco" Low-pressure Battery.

teries to give various voltages up to 115 V are made up of the requisite number of celluloid cells, each of 1.5 volts, of the Leclanché type; they are sent out in a charged state, the cells being filled with a jelly which dissolves when the cells are filled with pure water, forming a non-acid electrolyte. Such a battery may be re-charged by connecting it direct to the d.c.

domestic lighting circuit through a switch and suitable lamp. The low-pressure batteries, from 2½ to 6 volts, are suitable for dull-emitter valves (total consumption not to exceed 1 amp.) being composed of a smaller number of larger cells similar to those described above. They are enclosed in neat wooden boxes and may be connected to a d.c. lighting circuit of from 100 to 250 volts through the lamp as shown in fig. 4; another type is obtainable for connection to a d.c. supply which is not absolutely pure, it being claimed to reduce disturbances of this nature. The voltmeter and plug switch indicated in fig. 4 enable the voltage of each half of the battery to be ascertained, for if one half the number of cells only is used at a time the other half will recuperate, which is a characteristic of cells of the Leclanché pattern. These batteries operate continuously while they are connected to a source of supply, but should the charging supply fail, we understand the battery will continue to function for several hours.

Traders' Demonstration Outfit.

The Marconiphone Co., Ltd., has drawn our attention a new departure in the form of an outfit which is primari intended for the use of wireless dealers who wish to demo strate. The equipment consists of a full-size "super" Rour loud-speaker, a "super" amplifier with eight valves, fi 60-volt h.p. accumulators, and two 6-volt l.p. accumulator The outfit can be operated from any good 2-valve h.f. ar detector set, or a special 2-valve set without feedback ca be supplied for this purpose. The apparatus is similar to th used for the company's "public address" system and has bee designed in response to requests for a set of equipment sui able for general demonstrations, concerts, &c. It is probab not generally known that a suitable Marconiphone installatic to operate Round loud-speakers has hitherto cost somethir like £800; the new outfit will, however, be retailed at £140.

Electric Street Lighting in Rural Areas.

By Edward C. Lennox.

(*Abstract.*)

The lighting of rural areas with long straggling roads presents a rather different proposition from that of lighting city streets. The high standard of illumination aimed at in the busy thoroughfares of towns is not essential. Nevertheless, the lighting must be such as to fill certain conditions. Economic conditions are different. The town, with its high rateable value and comparatively shorter lengths of roadway to be lighted, and the rural area, with its very low rateable value and long lengths of roadway to be lighted, present two entirely different problems.

When comparing illumination values in candle-power of lamps of the vacuum type with similar-sized lamps of the gas-filled type, it should be borne in mind that, where stated in "candle-power in the maximum direction," the figures given refer to mean horizontal candle-power in the case of the former, whereas the measurement in the downward direction is given for the gasfilled lamp. The method of expressing the efficiency of lamps in spherical candle-power has obviated the possibility of error in comparing efficiencies; but the only satisfactory method of comparison is to state efficiency in terms of lumens per watt. This figure is obtained by dividing the total lumens obtained from the lamp, by the watts input.

One of the essential points to be considered in laying-out an electrical street lighting installation is the question of pressure variation. The voltage from the supply station is, of course, liable to some slight variation due to the varying loads; but these variations are usually kept strictly within prescribed limits. It often happens, however, that, with the idea of obtaining more value for money (by extending the working life of the lamp), lamps are fitted to a circuit with a pressure of (say) 10 per cent. below that for which they were made.

Fig. 1. Arrangement of Conductors at 250 Volts, showing Guards.

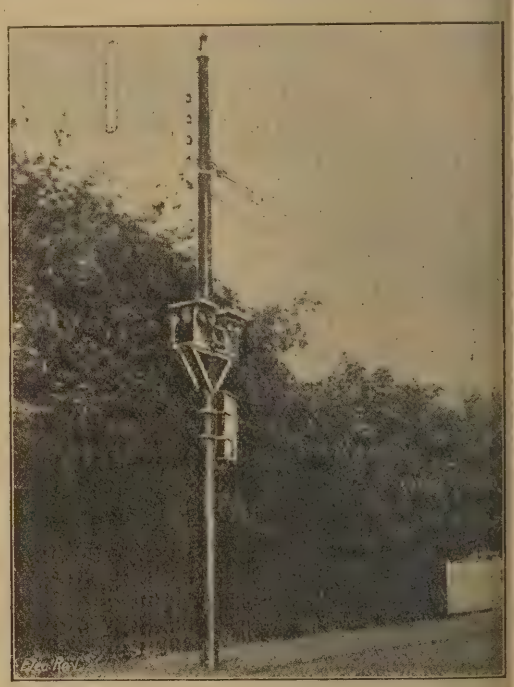

Fig. 2.—Switch Pole with Transformers; 100-Volt System.

When one is buying light, as is undoubtedly the case with street lighting authorities, it should be considered which is the most economical problem:—Running the lamp at a lower pressure than that for which it was designed, and so getting a longer life, but less efficiency, or running the lamp at a higher pressure, and so getting better efficiency, but shortening its life.

Take a 200-V, 100-W lamp costing 5s., supplied with energy at 3d. per kWh, normal life 1,000 hr., and average lumens 1,100. The cost of energy for the lamp giving 1,100 lumens for 1,000 hours is £1 5s., and the cost of the lamp is 5s., totalling £1 10s. With the lamp operated at 10 per cent. below the rated voltage, and its life extended to 1,500 hr., the light output would be reduced by 33 per cent., and the lumens output therefore would be 737 lumens. The consumption would be reduced by 15.5 per cent.; therefore, the watts consumed by the lamp would be 84.5. The cost of energy for the lamp would be 31s. 3d., and the cost of the lamp is 5s. Therefore, the total cost to obtain 737 lumens for 1,500 hr. would be 36s. 3d. At this rate the total cost of the lamp giving 1,100 lumens for 1,000 hours would be 36s. 1d.—an increase of 6s. 1d. over the cost of running at normal pressure. With the lamp operated at 10 per cent. above the rated voltage, and the life reduced to 667 hours, the light output would be increased by 40 per cent. The lumens output would be therefore 1,540 lumens. T consumption increase would be 17.5 per cent. Therefore, t watts consumed by lamp would be 117.5; cost of energy for t lamp giving 1,540 lumens for 667 hours would be therefo 19s. 6d., and the cost of the lamp is 5s. Therefore, the tot cost to obtain 1,540 lumens for 667 hours would be 24s. 6d. this rate, the total cost of the lamp giving 1,100 lumens f 1,000 hours would be 27s. 11d.—a decrease of 2s. 1d. on t cost of running at normal pressure.

These results should show the futility of under-runnir lamps, and it cannot be too strongly emphasised that all lam should be run at their rated pressure; especially is this so the larger and more efficient types of lamps, where the lo becomes ever greater.

The control of street lighting in a town or city has alwa been a vexed problem. The use of lamplighters invariab results in lighting up some time before dusk, in order th the last lamp shall be lighted in time, or in certain lamps n being lighted in time. This drawback in areas where t lamps are more or less congested is emphasised in rur areas where the lighting covers long distances in all direction and where it would generally be necessary for the lamplight to traverse long roads twice before the whole installation w lighted. It is impossible in these days to conceive that i dividual switching can be justified on maintenance costs alon Time switches are therefore universally resorted to, whi switch on and off automatically the whole of the lamps predetermined times.

The choice of fittings suitable for street lighting by electr city is so wide that it is only necessary to lay down certai principles which should be borne in mind. They must be robust design and weatherproof, well ventilated and fitted wit an easily adjusted focusing device; they must also be arranged that the light rays are directed so as to obtain th best distribution of light.

The fittings should be fixed as high as possible to give th

best results. Where large units of 300 W (4,300 lumens) are used, and mounted (say) 25 to 30 ft. high, with spacing of 300 to 400 ft., with directional type reflection, the resulting illumination would be even and leave little to be desired. It is not possible, however, owing to the question of cost, for such large units as these to be installed in the type of district under consideration.

Where expenses allow, an improved fitting can be used comprising a white enamelled reflector and a small prismatic refractor.

These fittings should be equipped with an anti-vibratory device, of which there are several on the market. The most efficient type of those adopted by the author consists of two concentric rings connected to one another by strips of phosphor-bronze gauze, which is very springy and which damps any vibrations that occur on the outer ring before they can reach the other.

Street lighting networks such as are required in rural areas can be carried out by several methods—by underground cable; by using the existing pole line carrying the supply company's overhead distribution networks, supplying at 250 V as the normal pressure for lighting purposes, to carry a switch wire, and using the supply company's neutral wire as a return; by utilising the supply company's existing pole lines to carry a separate street lighting network, consisting of line wires and return, operating at a similar pressure as the network; by running out new overhead networks at the supply company's pressure; by reducing the supply company's pressure to (say) 110 volts, and running out networks at this pressure; and by adopting the "series" system, widely used in America.

In considering the various systems, one must first compare the capital costs entailed. This is difficult to give with any degree of accuracy, as the costs are governed to a great extent by local conditions. The author has, however, for comparative purposes, prepared the costs for a complete lighting installation over a certain mile of roadway, but has been unable to obtain with accuracy figures showing the average cost of the "series" system. On an underground system (made ground) the average cost per yard of the network, including switches, &c., is estimated at 10s. 7d., and the average cost per lamp (40 yd. spacing) at £32; on a pole line with switch wire, using the network neutral as the return, the network (per yd.) and the lamp costs are 2s. 5d. and £8 2s. respectively; on a separate pole system, the network and lamp costs (including the cost of the poles) are 6s. 4d. and £15 10s. respectively; and on the 100-V system (including the cost of the poles) the respective costs are 3s. 4d. and £10.

The use of underground cable for street lighting schemes, while very desirable from many points of view, is almost out of the question for rural districts, owing to its prohibitive cost. Where it is unavoidable, the cable used is paper-insulated and lead covered, wrapped with hemp, and jute served. The cable should be looped into the foot of each lighting pillar, a special dividing box being available for this purpose, having glands for entry for two cables. This greatly facilitates testing for faults.

For reasons of economy, however, it is generally found impossible to put forward to rural district authorities an underground scheme for carrying out street lighting. There are many towns and villages, and thousands of consumers of electricity to-day, who would still be without supply if overhead work had been prevented. Where wood poles are used, these should be of Norwegian, Russian, or Swedish red fir cut in the winter season and retaining the natural butt of the tree. They should be creosoted to the Post Office Specification with 10 lb. of creosote per cu. ft. Steel poles, when necessary to take the greater stresses, should be tubular, and stepped in three pieces, to obtain relative strengths for the stresses imposed on different parts of the pole. Where an overhead network already exists for private distribution, the poles can be used to carry a switch wire, and the existing neutral can be used as a return. This is not always favoured by the supply company, as it interferes with their B.O.T. earth tests on the neutral, and is not desirable from the street lighting point of view, as the pressure drop along the neutral of the company's network, which may vary considerably during the lighting hours, would also affect the pressure at different points on the street lighting circuit.

New street lighting networks, comprising feed and return wires, when run out on existing private distribution networks, are erected on the sides of the poles opposite to the existing wires, and arranged so that like phases or neutrals are opposite to one another.

Where new construction of poles, &c., is necessary allowance should be made to cater for the erection of additional wires for further development of the street lighting network or private distribution network.

The reduction of the normal supply pressure of (say) 250 V to a pressure of (say) 110 V for street lighting purposes deserves every consideration. The advantages gained by reducing the pressure are:—Increased efficiency of the lamps, increased distribution value of light, lower costs of running out networks, and the use of stronger lamps.

In laying out a scheme of this type, which would be in an area already supplied at low pressure, the source of supply to the street lighting network should be fixed as near the centre of the area as possible, or the area, if large, should be split into sections, with a source of supply at the centre of each section. At this point are fixed the main switch and fuses controlling the whole installation, the time switch for automatically switching on and off the supply to the installation, and the transformer or transformers to reduce the pressure to 110 volts. The secondary side of the transformer is connected directly to the street lighting wires, which would radiate in all directions necessary, so as to reduce as far as possible pressure drops in the outlying parts of the sections.

The transformers used in these schemes are oil insulated, and housed in outdoor type cast-iron or sheet-metal tanks—the latter being lighter, and therefore preferable. The accompanying illustration, fig. 2, shows the arrangement of box and transformers on the pole.

Care must be taken to earth efficiently all ironwork, including the core and tank of the transformer.

Discussion.

Opening the discussion, Mr. W. Bell, M.B.E. (Camberwell), raised a question with regard to the table of costs set out in the paper, and said he found in London that gas was a more economical proposition for public lighting than was electricity.

Mr. H. E. Fryer said that if rural roads, such as the Great North Road, or the big arterial roads in the South and Midlands, could be lighted so efficiently that the ordinary considerate motorist need use only headlamps which were not too powerful and a nuisance to other road-users, the lighting profession would be doing a very great public service. In town streets few motorists used their big and powerful headlights, but in the dense darkness of the country they all had to use them. The present method of lighting, though excellent in its way, did not really meet the requirements of illuminating a road to an extent which made dazzling headlights unnecessary. The most comfortable conditions under which he had driven through town streets had been in shopping areas, where most of the light, without undue shadows, had come from the shop windows, entertainment houses, &c. It seemed to him that with that lighting the road got equal illumination, and it came from a direction which was at right angles to the line of travel; by putting a relatively high light on one side of the object on the highway and putting the other side of the object in shadow, it brought that object very clearly to the notice of the driver. If they were to have horizontal illumination rather than vertical on the roads under certain circumstances, objects, whether dark like the policeman's uniform mentioned by the president the previous day, or light like the policeman's white coat, would be more visible alike on dry highways or wet. If more lamps, at less distances, were placed on the great highways, it would be an advantage.

The President said that if they were to have electric lighting by overhead mains on the great roads of the country, it would probably be very much on the lines suggested by Mr. Lennox rather than on the lines which one saw at present. Mr. Lennox seemed to have hit on a very neat means of carrying overhead electric lighting conductors.

Mr. J. Christie, M.I.E.E., electrical engineer and manager, Brighton, said this question of overhead transmission in rural areas was a point which most engineers were having to consider very seriously. Overhead lines seemed to be the only effective method of dealing with the problem. Mr. Lennox's suggestions would be very useful. In his own district they had reconditioned their electric lighting. They were using 50-volt lamps in series, and had 1,500-watt lamps in certain areas, and found that the very robust filament required for carrying the current gave a most magnificent light.

Mr. R. B. Mitchell, president of the Incorporated Municipal Electrical Association, congratulated the author of the paper on his contribution, and on the very neat arrangement of overhead wires which he had shown to the meeting. It was an example worthy of being followed all over the country. It seemed to him that the lighting of rural areas would only become possible by co-operation between the supply undertakings and the rural councils. He thought in the future it would become possible, because of the rapid extension of electricity supply even in rural areas now. The poles could quite well be run along roads and used for carrying supply wires as well as wires and lamps for lighting the roads. With regard to the advisibility of using lamps in series, he thought lamp makers were now becoming very efficient in producing high-voltage lamps of almost equal efficiency and life. He thought there would be very little to choose between them. In the matter of electric lighting in rural areas, there should be some relaxation of the very rigid Board of Trade regulations, which were framed to prevent accidents, but which in effect were probably more rigid than was necessary and were a great handicap to the development of rural electric lighting. He thought there was a happy medium which would reduce the cost of overhead lines very materially.

Mr. A. C. Cramb, M.I.E.E., borough electrical engineer, Croydon, said the paper was a very valuable one and illustrated an excellent system of lighting. A point he would like to raise was whether the lamps on Mr. Lennox's system were at a reasonable height, seeing they had to be some distance apart; whether by altering the height they might get something better in the way of directional lighting. There was room for considerable improvement in this direction, and the Institution might debate the possibilities of some fitting which would direct the rays up and down the road. The condition and organisation of this country's roads had become an appalling scandal, and the Government had had to set up the Ministry of Transport, which had earned a great deal of gratitude for what it had done so far in road improvement. It was highly

important that roads should be properly illuminated. The illumination of the streets and roads of this country, taken as a whole, was appalling. Even in London there was no system or continuity. There were certain bright spots where there was a brilliant display of lighting, but there were others which were very much the opposite. What was required was some co-ordinating effort, just as was being done with regard to road construction. That Institution could do a very fine work if it could put forward to the Ministry of Transport suggestions with regard to the systematic lighting of the roads of the country.

Mr. W. J. Liberty, lighting superintendent, City of London, and hon. secretary of the Institution, said he entirely sympathised with the suggestion that there was great need for co-ordination of lighting systems in the London area. One of the reasons why there was this multiplication of forms of lighting in London was that around the City Corporation itself there were now some thirty metropolitan boroughs, each with its own ideas of lighting. Some had got installations of electricity. Others had deeply-rooted ideas in favour of gas. The result was that the motorist moved from intense brightness to great darkness. This was more common in the metropolis than anywhere else, because other districts had only one responsible local authority. He had known travellers run into something because they were blinded by the relative darkness of lesser lighting after a period of great brilliancy, though to anybody who had not passed out of that brilliancy the darkness was not by any means so serious.

Mr. Leon Gaster, of the Illuminating Engineering Society and the National Safety-First Council, said that good road lighting had become a subject demanding very special study from a national safety point of view. He did not think there would be so serious a difficulty in getting proper light control if a good case could be presented for such control. He saw no reason why some portion of the revenue from motor taxation should not be allocated to road lighting. Last year there were 80,000 road accidents, and statistics of that kind should be utilised to strengthen the case for proper road lighting.

Mr. Fowler (Dundee) said that in Dundee they had a main road three miles long and 160 ft. wide, which they had been called upon to light in sections. It was a road to relieve central city traffic. They had fitted up 300-watt lamps 25 ft. high, with a spacing of only 40 yards. In his opinion that was sufficient to light that very broad highway, for traffic both inward and outward.

Mr. Lennox, in reply to the discussion, said that if this question of road lighting were taken up as a national affair and put into the hands of rural surveyors themselves for control, they would no doubt look at the lighting question much more sympathetically. It was simply because lighting was left in the hands of local parishes that the rural surveyor was at present not very sympathetic and looked upon lighting poles as a curse. The costs which he had given in the paper included the cost of the lamps. The saving he got, of 2s. 1d., was more than would be the actual cost of replacing the lamp. Fittings should be cleaned at least once a month and preferably perhaps once a fortnight, and the man who cleaned saw the lamps which were out, and replaced them where necessary. Headlights on motor-cars would remain a necessity for many years yet, even with lighting of the roads such as he had described. He did not think they could seriously contemplate series lighting for rural areas because of the cost and the question of going to the Government. It was a great handicap to electrical development in rural areas to have to have the Board of Trade regulations so rigidly round their necks. They could hardly move for those regulations. If the Electricity Commissioners were to look on the matter in a broader attitude he thought it would be for the benefit of the whole community. He entirely agreed that all possible statistics should be secured, to be put before any authority concerned in the question of public safety. With regard to the need for co-ordination, which he agreed was very important, he thought it might be well for that Institution to frame a resolution with a view to a petition being sent to the Ministry of Transport, urging that authority to consider this question of road lighting.

Public Lighting by Gas.

A paper on this subject, prepared by the Distribution Department of the South Metropolitan Gas Company, was read by Dr. J. S. Thomas; it pointed out that the present inadequate lighting of the streets was due to the inadequate expenditure on this service, and criticised adversely the adoption of luminous flux as the fundamental quantity in the discussion of lighting problems, preferring the specification of candle-power and its distribution. The chaotic state of the subject in respect of the diversity of lighting appliances and lighting specifications was deplored, and commendation was expressed for the valuable work done by Mr. A. P. Trotter. The lighting of 95 per cent. of the streets was classed as "inferior beacon lighting," and it was claimed that gas was much cheaper than electric lighting.

In the discussion Mr. L. Gaster said that accidents by night were far in excess of those by day, due to insufficient lighting. Mr. A. C. Cramb referred to the importance of giving the best possible illumination at the minimum cost. Mr. S. B. Langlands said that the Institution should tackle the whole problem in conjunction with the Ministry of Transport. Mr. T. Newton urged the need for a standard table of illumination. Mr. J. Stewart agreed with Dr. Thomas regarding the mode of specification, and drew attention to the new specification of the B.E.S.A. for a portable photometer. Other speakers took part in the discussion, and Dr. Thomas, in reply, said the public had not yet been educated to realise the need for better street lighting; it was not a case of gas *versus* electricity, but of getting the necessary money—good light could then be provided.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Broadcasting Power.

The *Daily Express* has seen fit to give prominence to an article by Prof. A. M. Low on a subject of vital commercial importance, namely, the transmission of power, and claims to speak in the name of science in favour of a system of broadcasting power.

Whilst admitting the need for educating the public mind to the urgent necessity and commercial importance of scientific research, it cannot be too strongly stated that the extravagant prophecies of Prof. Low are liable to mislead those who have no special knowledge of the subject and to raise expectations impossible of fulfilment, which are bound to bring science into disrepute.

The bankruptcy of science is now almost a catch phrase, which is indeed deserved if such vapourings in the Press are allowed to go unchallenged. The gentle sarcasm of Senatore Marconi as to the remotenesss of its solution is not sufficient.

I claim as a member of the community to raise my voice against it, although it is difficult to deal with the matter seriously.

It is not as if there were no data on which Prof. Low could form an opinion; we have at the present time high-powered stations broadcasting energy, but not a thousand-millionth part of that energy is usefully employed.

If he proposes to limit himself to beam transmission, experience again tells us that for any useful distance the improvement is very slight.

The experiment which caused this brain wave is a very old one, often done to amuse the young student—the melting of a tenpenny nail without wire attachments, by induced currents. This is a very well-known high-frequency experiment, and is accomplished by the very opposite method to that which Prof. Low proposes, namely, by concentration.

H. P. Amphlett, F.P.S.L.

London, *September 25th*, 1925.

The Æsthetic Aspect of Advertisements.

In view of your Advertisement Competition, the following parable on the æsthetic aspect of advertisements may be of interest to readers of the Review.

There is a street in Progress Town called Advertising Street, and it is through this thoroughfare that all who wish to buy must pass. Some hurry through without stopping—these are wise. Others observe with wise and serious faces and collect and collate and revise and compare and consult statisticians and publicity experts, and do all manner of such things—these are not wise. Some few, who have no intention of buying, loiter along with much amusement.

This street is exceeding noisy, for every advertiser there is shouting at the top of his voice day and night. So loud are their voices that, though everyone protests at the clearness of his neighbour's cries, the buyers cannot distinguish what one of them is saying. Some shout the same thing day after day, year after year, until the antiquity of their dress and accent draws upon them the ridicule of their fellows. Others change their fashions with such bewildering rapidity that the buyers are puzzled afresh every day in making out who they are. Others, again, have a set rotation of fashion to which they adhere, and which earns for them the nickname of "farmer" from their enemies. And there are always at least six who have been standing on tip-toe and all waving the same article and shouting: "Mine is the best," with such diligence that they have entirely forgotten why it is the best, nor could they remember if they tried. And altogether there is such a noise and a bustle and a waving and a confusion that it is not uncommon for the poor buyer to find he has ordered four times what he thought of getting and ten times what he wants of an article he does not know how to use.

But besides these general noises, there are some particular strange antics to which I especially desire to draw attention.

There was once an advertiser here, named Irrelevance, who, having hanged himself by the heels from the doorway of his place of business, said: "Surely the admirers of my gold watch will enter this door." But of all who passed by and pitied him, not one so much as noticed that he had a gold watch. He was much distressed at this, and grew thinner every day until, when I last heard of him, he had shrunk to the thickness of a bankruptcy petition. A little while after another and stronger advertiser thrust him aside and, widening the doorway, took up his abode there.

There is also another advertiser who, having thrown mud over himself with a spade, put on a clean shirt and collar and, disdaining lavender water, pushed his way among the buyers with much assurance.

There are others of a weird, and some of a horrible, sort. One of the former, who is well known there, though not very prosperous, goes about shouting: "Although there are 14 hippopotami in England, not one has trodden on my toes, which are free from corns." The buyers laugh at him, but some few, wanting foot-salve, buy a box of his. One of the latter sort of advertisers, who is yet better known and very prosperous and confident, sets his clerks to dig up the graves of illustrious men, such as Confucius, Drake, and Shakespeare. He then hangs their bones upon his kettles, his pots, and his pans. By this means he is enabled to make a great noise and hopes to charm the skies to drop gold upon him.

Advertising Street was first built by a professor, who said: "Tell people that there is a sky, and they will want to buy your blue saucepans." And although he taught his workmen this song, and although they chanted it while they built Advertising Street, he never could say why the sky should tell you about saucepans. Perhaps it is because the description which a grocer friend of mine read in a book by a man named Conrad, which is a description of the kings of the West and of the East, reminded him that his stock of yellow and red cheese was low. Though why sunsets should remind grocers of cheese is known neither to me, nor to you, nor to any other creature.

Great Malvern, *September 26th*, 1925.

Radio Aerials and Lightning Discharges.

A few instances have been reported during the past summer of wireless apparatus being destroyed by lightning, but considering the number of aerials now in use the damage has been unexpectedly small. The extent to which aerials are affected by lightning discharge and the results likely to arise therefrom are questions of practical importance to all users of wireless apparatus, and an attempt is being made to collect information relative to actual cases in which aerials and apparatus have suffered in this way. I shall be glad if I may use the publicity of your columns to ask anyone, and everyone, whose apparatus has been damaged to forward full information to me at the address given below. The data particularly required are:—

(*a*) The date and time of the occurrence.
(*b*) The position and approximate dimensions of the aerial.
(*c*) The nature and position of the earth connection.
(*d*) A brief description of surroundings, *i.e.*, position of adjacent houses, trees, telephone wires, &c.
(*e*) Whether the aerial was directly earthed or whether either receiving or transmitting apparatus was in circuit.
(*f*) The fullest possible description of the incident and the nature of the damage done.

The Cost of Living in Bombay.

I wonder if one of your readers who has had recent experience in Bombay would be good enough to publish the usual particulars requested by those contemplating work in that city.

Also, what would be the equivalent in Bombay of a salary of £300 per annum in this country?

Sales Engineer.

September 29th, 1925.

Rural Electricity Supply.

It is unfortunate that Mr. Fennell is so prone to make overstatements. In his letter published in your issue of September 25th he writes:—"The Post Office can, and do, put their lines underground when they wish; for instance, in cities and when leading into exchanges. Their talk of speech efficiency limits is a device to save themselves trouble—regardless of the enormous expense their refusal imposes on other utility undertakers, and therefore upon users of electricity."

The statement made in the latter part of this quotation is inaccurate. When projected high- and extra-high-pressure overhead lines will cross Post Office overhead lines, first consideration is given by the Post Office as to whether its lines can be placed underground without undue degradation of circuit efficiency, and in the great majority of cases it is the Post Office lines which are diverted to underground. Taking the country as a whole, I should say that at appreciably more than 75 per cent. of the crossings this is the method adopted, as the best way of meeting the difficulty. To say, therefore, that "their talk of efficiency limits is a device to save themselves trouble" is not only a reflection on the good faith of the engineers dealing with the matters, but is a very grave misstatement of the actual position. Moreover, Mr. Fennell has no excuse for making such a charge, as in a recent case in which his company notified the erection of an overhead power line with proposed crossings of Post Office routes at 29 points, the Post Office has offered to go underground at 22 of them!

Mr. Fennell may regard such loose accusations as a necessary part of his declared policy of "making ourselves a nuisance to the Post Office officials," but surely it cannot but be a disservice to his legitimate cause of pushing rural electrification?

The Roman Baths at Bath.

With all due deference to Messrs. Henley's regard for the principle of "Truth in Advertising," which regard we fully share, we cannot admit that any misleading impression could be caused by our advertisement in your issue of August 7th (supplement page 11). Not the slightest reference was made in our advertisement to the electrical installation at the Baths, but only to the Roman plumbing there. It might as well be argued that we should not quote in a wiring advertisement some remarks on electrical matters by, let us say, Mr. Baldwin, without previously assuring ourselves that his house had been wired on our system.

We admit, however, that our idea might have been used with even more point by Messrs. Henley's—if it had occurred to them first.

Johnson & Phillips, Ltd.
Charles Stewart, *Director.*

London, *October 2nd*, 1925.

The Manufacture of Induction Motors.

I am much obliged to Mr. Parkinson for his reply in this week's Electrical Review to my letter of the 14th ultimo, and desire to thank him for his kind invitation to investigate personally the claim put forward, but I regret to say I feel that no particular purpose would be served by doing so, as in all probability any information furnished would be in confidence and my objection to this would be that the advertisement referred to endeavoured to belittle the whole British electric motor trade and received a large amount of publicity, and therefore Mr. Parkinson should produce evidence, if he can, to substantiate his claim, and this evidence should have the same degree of publicity as his original claim.

I quite realise that if Mr. Parkinson has received internal information with regard to the turnover of various British manufacturers without their knowledge and consent, it is of a confidential nature and no doubt the persons who have obtained this information have every desire to remain anonymous. Nevertheless, I quite fail to see why this desire for secrecy on the part of Mr. Parkinson should prevent his replying to my questions Nos. 2 and 4.

With reference to Messrs. Parkinson's advertisement appearing in this week's Electrical Review, I must congratulate them on their turnover for July, and would be very interested to hear the total for June and August, and why, if as they mention "every month our output increases," the August total is not also shown.

Question 3 in my letter: "On what period of time is their estimate based," is replied to in their advertisement this week in the Electrical Review, and by a strange coincidence we also had an excellent order book for that month; our total a.c. industrial power motors amounted to 756, as well as a large number of d.c. dynamos and motors, which machines Messrs. Parkinson do not manufacture. If desired the Editor of the Electrical Review, or any other impartial person, can verify this figure.

By a simple calculation it would therefore appear that if Messrs. Parkinson and Crypto advertised jointly, we could claim instead of 1 in 4, 1 in 2½ or 40 per cent. of the total trade of the country in these motors, and we would not add, as they do at drapery sales, "for four weeks only."

The Crypto Electrical Co., Ltd.
J. G. Shaw, *Managing Director.*

London, *October 3rd*, 1925.

Is the Contracting Business Degenerating?

Judging by the weekly reports in your "Contracts Closed" columns, I should say the answer to the above question is in the "Positive." In this week's issue the following are noted: Installations in 380 houses for £2,772 (a little under £6 per house), the highest tender being £6,174. Corporation Depôt accepted at £184, the highest tender being £257. Town Hall accepted at £103, the highest tender in this case being £197. In the foregoing cases I am not *directly* interested, but as an electrical contractor who turns out high-class work at consistently low rates, it is with feelings of disgust that I read the above figures. It is fairly obvious that there is something wrong, and it is little wonder that your budget of bankrupts gets larger weekly. My principle is that it is better to do nothing than to work for nothing and make a present of £20 to your cheesparing client. Recently I was asked to tender for a school installation in an outlying district. My quotation was £89, but a firm of plumbers cut me out by £19. This meant that they intended to carry out the contract £9 below cost. For comparison purposes I afterwards made up an estimate based on all kinds of Continental and other rubbish, and even then my price worked out at £81. How is it done?

Polyphase.

October 3rd, 1925.

Legal.

The Assessment of an Electric Sign.

In the Glasgow Valuation Appeal Court on September 29th, the Scintillating Advertising Company (Scotland), Ltd., Glasgow, appealed against an assessment of £400 and suggested £49 as the proper figure. For the company it was explained that the subject involved was an electrical device erected on the roof of a building. All that was outside the building was a hoarding, fitted to which was a large number of electric lamps which were illuminated to produce various messages. The mechanism operating the sign consisted of a dynamo, transforming plant, and 4,000 movable types. The firm operating the sign paid a rent of £100 for the use of the room.

Mr. Alexander Walker, City Assessor, said that the sign appeared on the supplementary valuation roll for last year at £75. The rent of the room itself did not enter into the case. It was only the erection, including machinery, which was being valued. It was his contention that the erection was held by the appellants from the London firm on a four years' lease, which might be extended until the expiry of the patent. Replying to a question, the agent for the appellants stated that the patent had ten years to run.

The Court fixed the assessment at £60, and the Assessor intimated that he would lodge an appeal.

Warehouse-Breaking.

T. Watson, J. Grieveson, W. C. Sefton, and J. W. Sulsby, of Framwellgate, Durham, were remanded at Durham on September 30th on a charge of warehouse breaking and of malicious damage to electrical fittings at the Durham main electrical power station, the property of the Newcastle-on-Tyne Electric Supply Co., Ltd. Watson said that he, Sefton, and Sulsby found a quantity of brass and copper on the floor, which they put in a sack; they then knocked off with a hammer the fittings of the engine, which they put into two sacks. Grieveson admitted helping to dismantle the engine. It was stated that two 6,000-V switches had been completely broken, and all the copper and brass had been removed. The total damage was estimated at £300.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

16,729. "Illumination device for projecting apparatus." A. Konieczny July 7th, 1924. (236,553.)

International Conference on High-Pressure Lines.—I is proposed, subject to there being a sufficient demand, to pub lish an English edition (in two volumes of about 1,100 page each) of the papers read at the International Conference o High-pressure Lines held in Paris from June 16th to 25th 1925. The volumes will also contain a report of the discussions If the demand reaches 400 copies, the price will be four pound for the two volumes, but in the event of 800 copies being sub scribed for, the price will be two pounds ten shillings. I order that an early decision may be arrived at as to whethe to publish an English edition, those wishing to subscribe fo copies are requested without delay to inform Monsieur Tribo Laspière, Union des Syndicats de l'Electricité, 25, Boulevar Malesherbes, Paris, of the number of copies they will require A French edition of the papers and discussions will also b published, provided that not fewer than 1,000 sets are sub scribed for. The price will be 200 francs per set, but afte November 1st, 1925, the price will be increased to 250 francs Orders for the French edition should also be sent to M. Tribo Laspière at the address given above.

A Power Company and a Pumping Failure.—A company in the State of Wisconsin, U.S.A., brought an action against a power company two or three years ago, alleging that the failure of the latter to supply power for pumping during a fire at the claimant's works involved the claimants in additional loss, put at $250,000. The case was at first dismissed but subsequently a jury awarded the claimants $47,000. The Supreme Court of the State, however, has recently reversed this decision and dismissed the action.

The

Electrical Review

VOL. XCVII. OCTOBER 16, 1925. No. 2,499.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON." Code, A B C. Telephone Nos: Central 8260 and 8261

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Electrical Advance for the 1925-6 Season.

SIMULTANEOUSLY with the altering of the clocks to normal time, the electricity supply industry switched over to full-speed activity. The early days of October have witnessed the beginning of a wonderful electrical forward movement which we hope will continue throughout the entire 1925-1926 season.

It is conceivable that there are electrical undertakings in various parts of the kingdom which notice the change-over from summer to autumn without any particular excitement. All experience heavier loads; a few—the small minority we hope—accept such business as comes without enthusiasm; some make seasonal efforts to stimulate the public interest and to satisfy it enterprisingly in their own separate and local ways; while others, availing themselves to the full extent of all the central and local help that is at their command, combine such help in one grand business-promoting campaign in which their public is carried into an electrified atmosphere in an attitude of interested inquiry and investigation.

Seated as we are at the hub of electrical operations, we have the best opportunity for judging things as a whole. What we see at the moment justifies a full measure of optimism with reference to what is going to happen this season. The need for keener commercial development of electricity supply has been recognised during the past few months, and well-thought-out plans have been quietly preparing in many quarters. These have come to fulfilment during the past week or two, and some account of them appears on later pages of this issue. Electrical exhibitions are in progress, as we write, at Nottingham and Leicester; electrical showrooms have been opened at Hackney, Poplar and Swansea; while at Glasgow a Demonstration Hall of the Scottish Electric Lighting Service Bureau was duly inaugurated on Monday.

This is a good beginning, and we believe it establishes a record opening for any electrical season here.

We hope that this burst of activity will set the pace for authorities in all parts of the Kingdom. It augurs well, we feel, for progressive operations on a grand scale during the next six or seven months, and promises big things for the Christmas and New Year peak-load and present period. The electrical retailer and contractor

probably have in mind the fact that the season when the Christmas buyer is making his purchases is only two months away. Notwithstanding adverse conditions, preparations should be made early in anticipation of a good Christmas Electrical trade.

The recent developments to which we refer in this issue are of three kinds, including temporary electrical exhibitions as at Nottingham and Leicester; permanent showrooms as at Hackney, Poplar and Swansea; and a Service Bureau, as at Glasgow. In addition to these, there is the lecture and demonstration work for which E.L.M.A. is lending its powerful and effective aid in some of these and various other places, and above all we have the all-the-time efficient live operations of the British Electrical Development Association, whose series of free public lectures for everybody in any way electrical made a good beginning yesterday.

We need to do everything in reason during the next six months to keep electricity to the fore. If we continue as we have begun, and find the B.E.D.A. in funds to render it equal to the opportunity now presented, it will be easy to understand why some people connected with the gas industry were so annoyed when we recently, quite legitimately and honourably, let their cat out of the bag.

British Electrical Goods are Best.

Currency having recently been given to reports that large purchases of foreign goods were being made by the Post Office, the Postmaster-General has issued a reply which should effectively dispose of the misrepresentations. He has selected four points for the purpose of his reply. It was complained that British makers were being ignored by the use of electrical date-stamping machines of foreign make to impress the words "British goods are best." To this it is replied that, while the machines were made abroad (but use British-cut dies), this was so because no such machines are produced by any British firm, and the home demand is so small that it is unlikely that they ever will be made here. Second, the Post Office was charged with neglecting British telegraph systems in favour of "the French Baudot machines." The reply to this is: During the past fifteen years the Post Office has purchased no foreign-made Baudot instruments except two specimen sets bought in 1922 from the French Government at a cost of £30; furthermore, British telegraphic inventions are widely used in the service. Complaint three was that a large consignment of German telephone switchboards had recently been delivered at the Central Telegraph Office. Here the P.M.G. shows that the statement can only relate to "One specimen set of a new foreign type of telegraph apparatus procured for experimental purposes," and no "live business" (interesting words!) can afford to refrain from constant experimental trials of the latest inventions. The last of the points selected for reply relates to a large order "running into six figures" about to be placed with foreign manufacturers for glass battery jars "with no better reason than a difference in the tint of glass." Here the P.M.G. is justifiably emphatic and describes the report as "wholly untrue." He might have used stronger language in view of the fact that the order referred to is presumed to be one for less than £2,000 which was given to a British firm which will make the jars at its own factory in Yorkshire. "No tender from the Continent was invited or received, and no order for such jars has been, or is about to be, placed abroad.

It is deplorable that such gross misrepresentations should be made, but one can hardly regret that the opportunity has been created for the head of a great public Department, spending many millions a year on manufactured products, to state so clearly its definitely and consistently pursued policy of buying British goods "whenever possible, even though foreign goods may be obtainable at slightly lower prices," in the sincere belief that "British goods are best." It is very satisfactory to learn that more than 99½ per cent. of the Post Office expenditure on electrical apparatus during the last year has been on goods of British manufacture. May this policy long continue! To certain other authorities let us say: "Go thou and do likewise!"

The Postmaster's testimonial to the quality of British electrical products should be given the widest possible publicity. British goods *are* best, and the world should be let to know it by the full force of advertisement as well as by practical observation and experience gained with the product itself.

Trade and Unemployment.

While considering this question of the policy of Government Departments with reference to the need for Home support to be given to British manufacturers, it is worthy of note that the Ministry of Health issued a statement last week stating that the policy set out in the circulars of 1923 and 1925—already discussed in these pages—has not been altered. It is still made a condition of any grant given expressly to assist the relief of unemployment that contracts for or incidental to such works are to be placed in this country. What other course could reasonably be pursued? But the circular went further than that by urging that in view of the industrial situation here, only under very special circumstances should contracts of local authorities for any works whatsoever be placed with other than British concerns. There is no political question involved—it is a sheer necessity arising from our special unemployment circumstances. But there is another aspect of the matter to which the Ministry of Health, with all its good intentions as aforesaid, has paid regard in connection with a war-time resolution passed at Stoke-on-Trent in 1916, when it was resolved that "no contract should be entered into with any person of German or Austrian nationality." That decision was right enough when it was arrived at, for we were fighting for all we were worth with every available weapon; there are still many amongst us who cannot yield to sweet relenting grace and make friends with their former adversaries, but one cannot shut one's eyes to the fact that since 1916 many things have happened which may legitimately soften some of the former asperities. Anyhow, the idea of the present Government appears to be that in view of the Commercial Treaty recently concluded with Germany, the Stoke-on-Trent resolution of 1916 should now be rescinded, because the said Commercial Treaty was based on the principle of treating German citizens, enterprises, and goods no worse than those of other foreign countries. This policy of the Government, however, does not prevent the Premier from urging every member of his Party to make a point of buying British goods. In his speech at Brighton last week he pointed out that a result of our serious unemployment was that we were faced with a growing excess of imports which if continued would be a "real danger to the economic stability of a country which relies on foreign countries and on overseas for the bulk of its food." The purchase of British goods would give an impetus to our trade which would be felt from one end of the country to the other. This was not counsel to discriminate against the people or manufactures of any particular foreign nationality, but to discriminate in favour of British products against all others with a view to cutting out that cankerous, demoralising and costly growth—unemployment.

Electricity Districts: Some Comparative Figures.

An interesting comparison between the various Electricity Districts (especially those delimited) is deducible from one of the tables in the last Generation of Electricity Report of the Electricity Commissioners. This table gives the total energy generated in each area, and thus shows in a general way their relative importance electrically. The London and Home Counties area tops the list with 1,949 million kWh, which is just over a quarter of the total of the entire country. The next in importance is a district not yet delimited, for obvious

reasons, *viz.*, Northumberland and Durham, which generates 1,041 million kWh. After this comes the S.E. Lancashire District with 838 millions. These three areas therefore account for more than half the units for the whole kingdom (*viz.*, 7,415 millions). Following these come the West of Scotland District, 535 millions; West Riding of Yorkshire, 426 millions; and Mersey and West Lancashire, 387 millions. Of the remaining areas, the totals begin to get small, there being only three with over 200 millions, namely, S.W. Midlands, 309 millions; N.E. Midlands, 265 millions; and South Wales, 206 millions. These districts account for about 80 per cent. of the coal consumed in the steam stations of the whole country.

A further point of interest may be deduced from the tables with regard to the efficiency collectively of the stream generating stations grouped under their several areas. As introduction, it may be noted that the average fuel consumption per kWh of the combined stations of the whole kingdom is 2.5 lb. of coal. Taking each area separately, the average figure is sometimes better, sometimes worse. The best area appears to be S.E. Lancashire, where the collective fuel consumption per kWh works out at 2 lb. The West of Scotland and North-East Coast come close with 2.1 lb., and the N.E. Midlands with 2.2 lb. The areas which approximate to the whole country's average of 2.5 lb. of coal are Mersey and West Lancashire, Edinburgh and Lothian, London and Home Counties, and West Riding. Coming to the higher figures, we have South Wales at 2.6 lb. and Mid-Lancashire at 2.8 lb. The areas averaging between 3 lb. and 3½ lb. are Bedford, North Hants and Oxford, N.W. Midlands, Lower Severn, Kent, S.W. Midlands, E. Midlands, and N. Lancashire. The only other district of importance is N. Wales with 5.6 lb. With regard to the N. Wales area it should be explained that only 11 million kWh is generated by steam power but 46 millions by water power.

Broadly, these figures in some measure show the relative scope for economies as between area and area.

The above analysis refers only to steam stations. The remaining units generated by other methods are, however, less than 5 per cent. Of this remainder about half is generated by waste heat. Gas, oil, refuse destructor and water power of small importance relatively make up the balance. Water power does not amount to 1 per cent.; indeed, except for the N. Wales system, the kWh generated by water would be only about 4¼ millions.

Firemen's Risks.

The accident whereby a London fireman, Sub-Officer Sinden, lost his life through receiving an electric shock in the course of his duty last month, appears to have been unique in the history of the London Fire Brigade—may it so remain! The practice of the Brigade has been to accept the risk, and to take no special precautions when live wires are present—"especially if the wires are only for lighting purposes." It was given in evidence that nearly every man in the Brigade occasionally received shocks, but regarded them as being only disagreeable, not dangerous.

Unfortunately, however, under certain circumstances shocks at pressures below 250 volts, especially if alternating, are unquestionably dangerous to life. The essential factor which appears to attend every case of the kind that we can call to mind is the presence of water, which enables the body to make a low-resistance contact with the earth or one pole of the circuit; that condition satisfied, it only remains for fairly good contact to be made with the other pole. Such accidents therefore usually happen in the bath-room, wash-house, or cellar with a damp floor. In this instance, of course, water was present in abundance; the other condition—contact with a live conductor—was fulfilled by the brass helmet of the fireman touching a "tube containing a live wire." With regard to the latter, Dr. F. J. Waldo, the City Coroner, in his able summing-up to the jury, recalled a fire in 1923 in Redcross Street, which was declared by a jury to be due to a defective electrical installation in slip-socket conduit, and said that "the same bad unsafe system" was in use on this occasion; he described it as "a system condemned in the excellent regulations of the Institution of Electrical Engineers," and said he had suggested the compulsory adoption of those regulations. It is true that "plain slip sockets" do not comply with the regulations, and are very rightly condemned, but unscrewed conduit properly installed with "some form of screwed or grip joint which will give ample and permanent electrical conductivity and mechanical rigidity throughout" is approved. Everything depends upon the honesty and skill of the workman who installs the conduit, but the same can be said of any job that is carried out with earthed metal sheathing, and we should be loath to condemn unscrewed conduit simply because the job can be scamped. The compulsory adoption of the I.E.E. Regulations would not necessarily abolish its use.

As regards the helmet, Dr. Waldo mentioned in his summing-up that "it was made of brass, with loose leather lining strung up inside, and with the one-inch-wide rubber band usually found round the inside rim of the helmets of the London Fire Brigade apparently removed in the present case." Had the rubber band been present, it seems probable that the violence of the shock would have been mitigated and the unfortunate victim might have escaped with a fright. Dr. Waldo raised the question of completely insulating brass helmets, but we doubt the possibility of this. The proper course is to cut off the supply of electricity at the main switch as soon as possible, just as the firemen already make a practice of cutting off the gas. The jury, agreeing that the cause of the fire was unknown, added a rider urging that firemen's helmets should be insulated, surely it is better to remove all possibility of getting a shock than merely to close one of the many possible channels by which it may reach the person.

Charges for Electricity.

At a meeting of the Corporation of the City of London, on Thursday last week, Mr. Deputy Sandle raised the question of the price of electricity in the City, and secured the appointment of a special committee to consider what further steps could be taken to obtain a cheaper supply. It will be remembered that the matter was under discussion about a year ago, and we are not surprised that it is once more brought up. As Mr. Sandle pointed out, during the past six years the two companies which supply the City have paid dividends aggregating 88 and 89 per cent. respectively, and have put to reserve sums amounting to 91 and 75 per cent. respectively—a total of 179 per cent. on the paid-up ordinary capital in one case, and 164 per cent. in the other.

There can be no question that, whatever was the case in bygone days, some of the London companies have been making large profits since the war. A comparison between the prices charged by the municipal undertakers and the companies in the East London area can leave no doubt in the mind of an impartial observer that the rates charged by the latter are greatly in excess of those offered by the former; moreover, the municipalities show more enterprise, seeking to develop the use of electricity and to serve the public, whereas the companies appear to be content with such load as the public brings to their doors. We are loath to make these admissions, seeing that we have always upheld the advantages of private enterprise, which in other spheres of industry is undoubtedly vastly more efficient than any form of communal management—but the facts admit of no denial.

Under the scheme embodied in the new constitution of the London and Home Counties Electricity District a sliding scale will come into force, and with the fear of 1931 removed the companies may change their policy and show less inertia. We hope so. In the meantime, though Mr. Sandle's references to the prices charged for bulk supply are based on a misapprehension, in the main his statements are accurate, and he has made out a strong case for reform.

Practical Nomography.

How to make and Use Nomograms.

By REGINALD O. KAPP, B.Sc., A.M.I.E.E.

(*Concluded from page 572.*)

In some cases, though rarely, an evenly divided scale is essential, and only obtainable if the chart is of the slanting line form. Fig. 7 is an illustration of such a case.

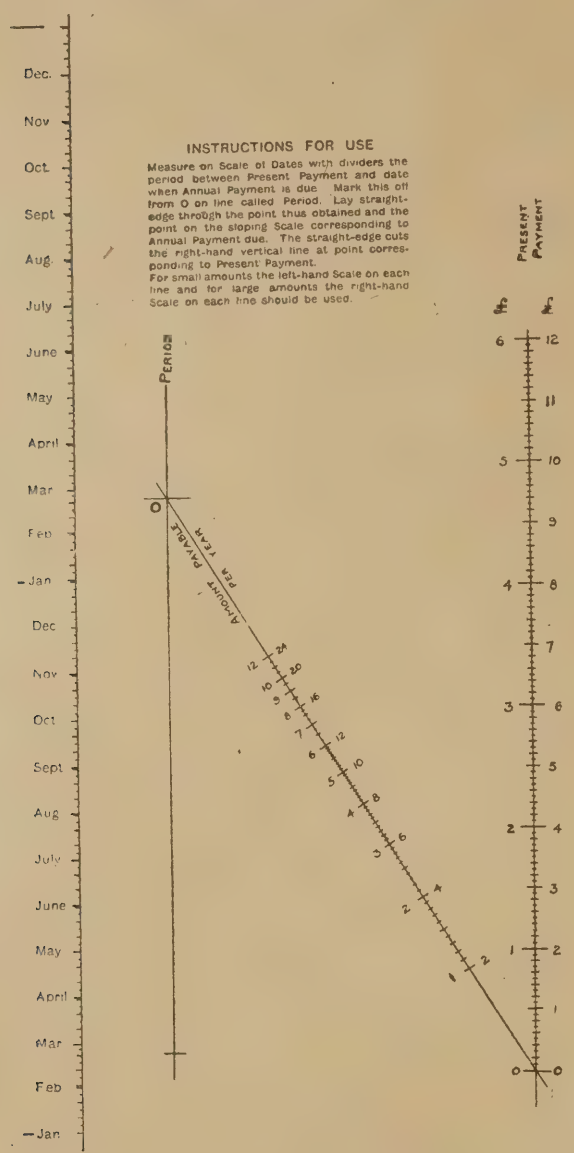

Fig. 7.—Nomogram of Present Values.

Parallel Line Charts with a Grid.

Some formulæ containing four independent variables can be represented by charts without pivot lines so that the ruler need only be laid on the paper once. Two of the variables are represented by intersecting lines forming a co-ordinate system or grid.

As an example, we will consider the well-known chart for finding the efficiency of a transformer at any percentage of full load from the iron and copper losses expressed as a percentage of full load. Let these be Fe and Cu respectively, and the efficiency be η at any proportion β of full load. The iron loss is independent of the load, the copper loss proportional to the square of the load, so that at any proportion of full load

$$\beta\ (100-\eta)=\mathrm{Fe}+\beta^2\ \mathrm{Cu},$$

which assumes the form suitable for parallel straight lines if we write it—

$$\mathrm{Fe}-\beta\ (100-\eta)+\beta^2\ \mathrm{Cu}=0.$$

A chart for this expression is about the most complicated type likely to be met with in practical work. It will be instructive to consider how to make it, but the reader should not allow himself to think it typical of the cases he is likely to meet with. He may skip this section without losing the context of the remainder.

This would give a chart of the parallel straight line type if β were constant. For $\beta=1$ the scales would be identical on the outer A and C lines, and the divisions would be placed at half the distance on the middle B line. We could construct a separate chart for each value of β and if the three lines were equally spaced, the scale divisions on the B and C lines would have to be different on each chart. It has already been explained that any alteration of the position of the B line alters the scale on the C line. By suitably choosing a different position of the B line for each value of β, we can therefore make the scale on the C line the same for all values of β. Then the various charts can be superposed, and will give us one A and one C line, but a number of B lines, one for each value of β. If the B line is moved so that its distance from the C line is p and the distance between the A and C lines is P, it follows from equation (2) given

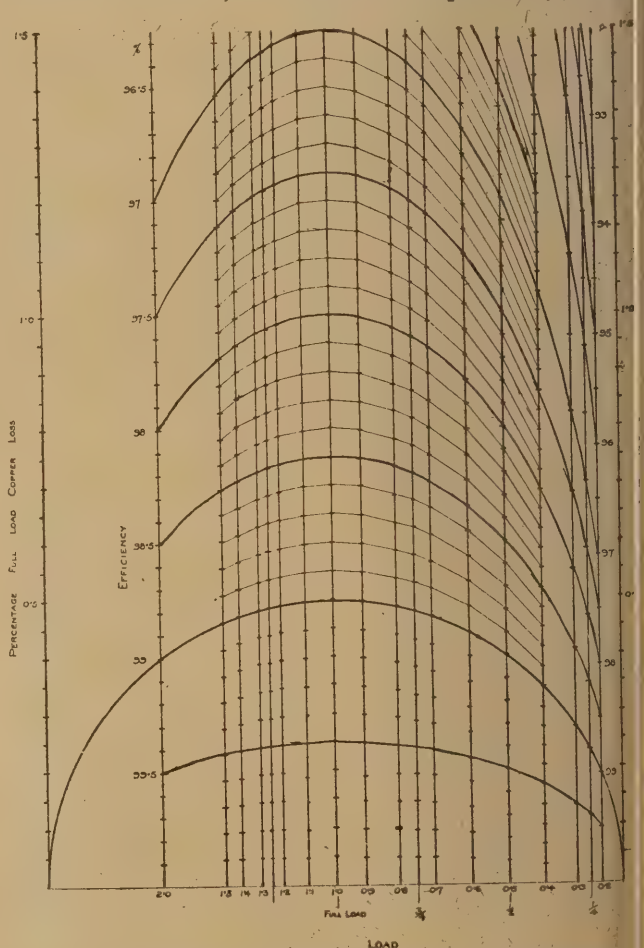

Fig. 8.—Nomogram for Finding the Efficiency of a Transformer at any Load.

already, that the scales are determined by the formula—

$$\mathrm{Fe}-\mathrm{P}/p\times\beta\ (100-\eta)+(\mathrm{P}/p-1)\times\beta^2\ \mathrm{Cu}=0.$$

It is now easy to see where the B line must be in order that the scale of copper loss may be the same as that of iron loss.

What we want to do is to multiply the scale by $1/\beta$. The displacement of the B line from the centre causes it to multiply this scale by $1/(\mathrm{P}/p-1)$. So we must make $\mathrm{P}/p^2-1=\beta^2$ or $p=\mathrm{P}/(1+\beta^2)$. The scale on each B line must be multiplied by p/P, so the functioned scale on this line becomes $\beta/(1+\beta^2)\times(100-\eta)$.

We now have only to choose convenient values for unit length such as, say, 1 per cent. = 10 in., and a convenient value for P such as 10 in., and we can construct all points of the chart, which assumes the appearance shown in fig. 8. It can be shown that the lines connecting points of equal efficiency are ellipses. The reader should not be confused by the fact that on this drawing the A line is on the right and the C line on the left, contrary to our usual custom. The point at which a line connecting the percentage iron and full load copper loss is tangential to one of the ellipses gives the load at which the transformer has its maximum efficiency.

Slanting Line Charts with a Grid.

We can now consider a much simpler type of four variable chart. We have seen that expressions of the form given in formula (3) $A/B=C$ can be represented by slanting line charts. If a fourth independent variable is added to one of the others, giving the form

$$(A+D)/B=C \quad \ldots\ldots\ldots\

arrange to have a factor $1/t$ by which this scale is multiplied. We remember that the scale is affected by the position of the B line between the A and C lines, and so a different distance of the B line from the other two for every value of t is indicated. If the distance between the A and C lines is P and a point on the B line is at a distance p from the C line, we have seen that the geometrical relationship holds—

$$A-P/p\times Bt+(F/p-1)\ C=0.$$

In order that such a chart may give us the required algebraic values unit length on the scale on the C line must be

$$1/(P/p-1)$$

of unit length on the scale on the A line and unit length on the scale on the B line must be $1/P/p$ of unit length on the scale on the A line.

Hence we correct for the influence of the factor t by making $P/p-1=t$ or $p=P/(t+1)$.

The scale on the A line is therefore a functional scale of W/S, the scale on the B line a functional scale of $p/P\times t^2=t^2/(t+1)$ measured parallel to the A and C lines and the functional scale on the D line is a scale of $-d$, or, in other words, an even scale reading in the opposite direction to the other two.

The position of every point for t is therefore a distance from the C line $=P/(t+1)$, and a distance from a line joining O_A and O_C, and parallel to the A and C lines of $t^2/(t+1)$. Fig. 11 shows the completed chart.

If we return to equation (5) we notice that just as we get the expression giving three straight parallel lines if $B'=1$, so do we get the expression giving two parallel and a straight slanting line if $B=0$. This leads us to realise that a more generalised treatment of the subject would have been more scientific. All types of nomogram become in fact special cases of some more general case. A much generalised treatment of a subject, while appealing to the mathematician, is, however, often less comprehensible to the applied scientist than a discussion of special cases.

Summary and Practical Hints.

1. An alignment chart is worth constructing where it is required to solve frequently a mathematical equation containing three or more variables, and a very high degree of accuracy is not essential. The method has the advantage over the slide rule that errors, and particularly errors in the position of the decimal point, are not made so easily.

2. To begin with, the equation must be got into such a form that the variables are separated. By this is meant that the equation is brought into a form in which it represents the *sum* or *product* of a number of terms where each term is a function of only one of the variables. We refer to these terms as A, B, C, D, &c.

3. Wherever possible the equation should be got into the form—

$$A-B+C=0.$$

In many cases this can be done by taking logarithms. In this form the chart consists of three parallel straight lines and is the simplest type to construct.

4. These three parallel straight lines should be equidistant in nearly every case; an exception may be allowed if unequal spacing allows available logarithmic scales to be employed. In the great majority of cases with equal spacing of lines the nomogram consists of logarithmic scales which can be directly copied from the scales on the slide rule.

5. The rule to determine which way the scales run is that if two successive terms are of opposite signs their scales run the same way; if two successive terms are of the same sign their scales run opposite ways.

6. Precise values must be calculated to satisfy one example of the formula. These may be the roundest numbers possible so as to simplify the arithmetic. A straight line called the tie line must be drawn in any convenient position across the paper. At the points where this cuts the scale lines write the values of the example chosen. This fixes the position of the scales. The angle at which the tie line is drawn should be such that all useful values of the variables are conveniently placed. Sometimes one can choose the example for values making all the terms zero. Often it is better to make the example correspond to average values so that the tie line can cut the scale lines at an angle not greatly different from a right angle.

7. If the expression consists of the form $A/B=C$, it can be generally reduced to the previous form by taking logarithms. If this is not practicable the nomogram consists of the slanting line or N type, the A and B lines are parallel, the C line joins the zero of their two scales. In N type diagrams the scale markings on the C line may either be on the portion between the A and B lines or on the C line produced beyond these. In the former case the scale markings may come inconveniently close together. If the markings are between the A and B lines, the scales on these will run in opposite directions, if the markings are outside the A and B lines, their scales will run in the same direction.

8. If the expression is of the form $A-B+C-D=0$, the nomogram consists of five parallel straight lines, the middle one of which is a pivot line. It is often convenient to arrange for the pairs of lines on each side of the pivot line to coalesce, thus reducing the number of lines in effect to three and to mark a scale for one variable on one side and for the other variable on the other side of the same line.

9. If the expression is of the form $(A+D)/B=C$,

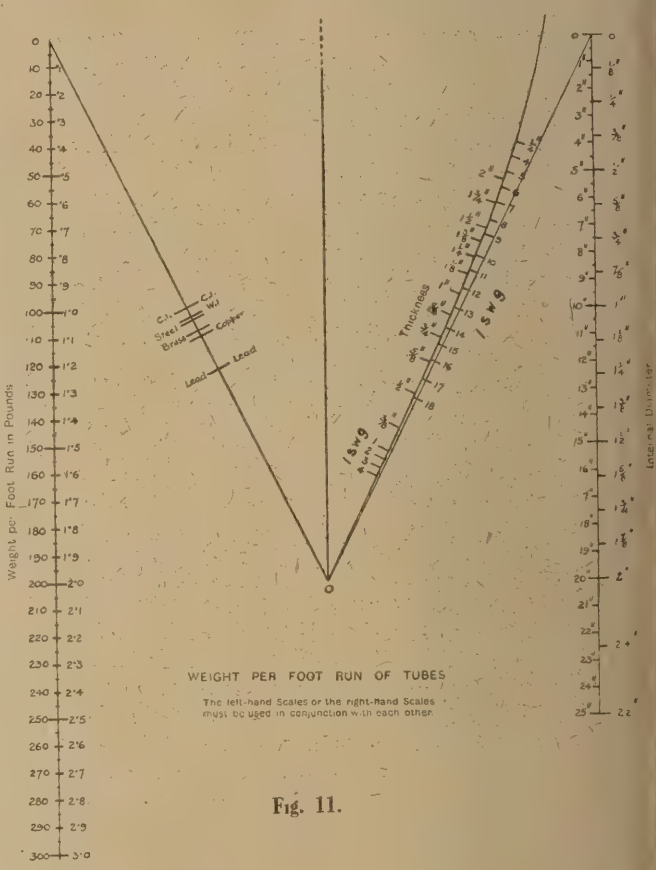

Fig. 11.

the nomogram will be of the slanting line type with a grid, the grid containing the co-ordinate system for the A and D and the A and B terms being on the two parallel straight lines.

10. If the equation is of the form $A-B+B\times C=0$, the nomogram will consist of three lines, of which two are parallel and one is curved.

11. In constructing a nomogram it is convenient to draw it not in the position as generally looked at in which the parallel straight lines are vertical but with these lines horizontal. It is quicker to mark the scale division by moving the light set square than by moving the heavy T-square.

12. It is often advisable to make any scale in two systems of measurements, for instance, in degrees Centigrade and degrees Fahrenheit, the one system being written on one side and the other on the other of the scale, and a great advantage of nomograms is the ease with which this can be done and the resultant saving in the work of converting units.

Electricity in Agriculture.

Rural Electrification and Electric Ploughing.

By J. A. SUMNER.

The uses to which electricity is devoted may be divided broadly under three main headings, *viz.*, industrial uses, household and domestic uses, and to fill the needs of agriculture. Of these, the last is the Benjamin of the trio—in age—but unfortunately not in favour. It is the desire of the writer to indicate the potentialities that exist for the use of electrcity in agriculture and rural areas in general, and, in suggesting methods which will bring it more widely into favour, to hint at some of the difficulties which lie in the path of progress.

It is estimated that England possesses many hundred thousands of acres of land under cultivation each year, the vast bulk of the work being done by the time-honoured if slow and tedious method of utilising the greatest literal horse power that is available and manageable by one man to drag the appropriate plough or other implement that is being used. Let us concentrate for the moment on the skilled operation of ploughing; a comparison between the results achieved by the former method and those which may be attained by the substitution of electrical energy as the motive power may not be invidious. In each case average land is taken as a basis for comparison. A ploughman with two horses would look upon one acre of ploughing as a good day's work, whereas with an electric plough several acres of land may be ploughed in a similar time.

The point in which advantage is gained with an electric motor is that far more power may be concentrated and controlled more easily than is the case with the horse-drawn plough, and whilst the cutting speed of the electric plough is not higher (although this can easily be achieved) since there is a limit to the speed for good ploughing, two or more furrows may be turned at one operation.

The writer thinks it possible that a practical system and machine—employing the tractor method—may be devised which will eliminate the "panning" of the soil due to the passage of the heavy tractor, which causes the soil to become more solid under compression, subsequently "ripping" over in solid layers instead of breaking up as it is thrown over by the plough. The manner of ploughing is an important factor, and it is claimed that with electric ploughing the crop yield has been proved to be from 20 to 35 per cent. greater.

There is another method offering more possibilities, in which the "roundabout" haulage system is employed and a type of plough having four shares, cutting two furrows on each side per journey across the field one way, is used. By a simple system of anchors and pulleys and a drawing rope which is wound at will on one of two winding drums on the motor, unwinding from the other pulley as it does so, the plough is drawn across the field. It is quite possible to utilise this method with only one man in sole charge. The number of ploughs of this type in use in this country is painfully small, being exactly one.

During a recent conversation between the writer and a landed proprietor owning a large estate, the latter stated that he would be unable to break up a large amount of land that was urgently in need of ploughing, as his men had far more to do than they could manage; he had no more horses available for the purpose, and it was impossible to obtain the services of a motor tractor. What was wanted, he stated, was some method that would enable him to plough more land in a given time, with results equal to those obtained at present. Surely electricity can come to his aid! It would seem that if rural supply authorities were initially to do the farmers' ploughing by contract, an immense material benefit might ensue. To the small farmer it would be a boon, in that he would be able to reduce his overhead charges due to the maintenance of an extra horse and plough, and in the limit would only need a horse for carting manure and transporting produce. Experience also shows that the larger farmers would eagerly welcome such assistance, as an auxiliary to their present facilities.

As to comparative costs, in the present state of the application of electricity to agriculture, one cannot be dogmatic in assertion nor are there any definite figures regarding the cost of electrical ploughing that can be taken as a criterion. The following figures will undoubtedly be criticised, as it is hoped, but the basis is one which cannot easily be obtained from manufacturers' costs or from experience; it is one which, the writer hopes, will be the nucleus of a scheme to be worked in Cheshire. Any corrections which are needed or any practical working costs which may be obtained will therefore be welcomed:—

Data: 15-h.p. motor.
Cost of energy, ¾d. per unit.
Rate of ploughing, ½ acre per hour.
Cost of machine and accessories, £500.

Costs based upon one acre of ploughing.
(*a*) Cost of electrical energy, 1s. 7d.
(*b*) Cost of labour (at 1s. 3d. per hour), 2s. 6d.
(*c*) Depreciation = 5 per cent. per annum (assuming 600 running hours = 300 acres per annum), 1s. 8d.
(*d*) To cover capital cost (assume life of machine = 10 years), 3s. 4d.
Total of *a*, *b*, *c* and *d* = 9s. 1d. per acre.

It will be obvious that the cost per acre essentially depends on the number of acres ploughed per day, as will be seen from the following, using the above data.

Rate of ploughing.	Cost per acre.
⅓ acre per hour	13s. 4d.
½ ,, ,, ,, ...	9s. 1d.
⅝ ,, ,, ,, ...	7s. 1½d.
¾ ,, ,, ,, ...	6s. 0d.
⅞ ,, ,, ,, ...	5s. 0d.

The standard prices for ploughing, as given officially, are at the rate of 20s. per acre.

The importance of a higher rate (not speed) of ploughing is obvious, and from a comparison of the prices which obtain and the prices which our basis of costs allows, there is scope for experiment so as to be able to reach a rate of good ploughing of from ¾ to one acre per hour.

It seems clear that the revenue accruing from this operation will not unduly inflate the dividends of the supply company, and also that whilst the capital invested would be covered it would be necessary to have a guaranteed area for work each year, to cover the capital costs incurred; but we must remember that this is pioneer work, primarily to impress the farmer with the usefulness and advantages of electricity for his multifarious purposes. The indirect gains which would be made by the supply undertaker if the operations were shown to be successful are those of a better load factor and an increase in the number of units sold.

The operation of artificially drying hay and corn crops and securing independence of weather conditions is one in which we can render assistance. The long series of finally successful experiments made by independent experimenters and also under the auspices of the Ministry of Agriculture tends to show that the farmer must more and more resort to electrical aid, and we must remember that as agricultural labour is scarce at the moment and is subject to seasonal demands, a reduction in the number of labourers and horses required may be gratefully accepted.

If we can consider our premises to be correct and, as an industry, can be fully convinced of the utility of electrical aids to the farmer, it is perhaps wise to consider the requirements for supplying this aid. That a fairly extensive network of overhead lines is required —adjacent to fields—and at a pressure of, say, 3,000 volts, with suitable cheap tapping points for connection to a transformer for low-pressure supply, is fairly evident. The essentials for such a line would be: freedom from onerous conditions often imposed by landowners upon wayleaves for poles; assistance from the manufacturers of overhead gear, switches, &c.; and an avoidance of regulations which impose a factor of safety of 10 to the *n*th power.

To indicate some of the difficulties which beset our path: First, there is that often conservative and variable factor—the farmer, who seldom sees the benefits that may accrue to him. To say that his fields can be cultivated electrically in a superior manner to his present method of cultivation (this, of course, needs to be a matter of fact) or that scientific methods must supersede more laborious methods, leaves our would-be convert quite cold; but to guarantee to do such work to his satisfaction at a less cost than he can do it himself may cause him to open both heart and purse. Here one may state that the electrical sword may be two-edged, as is shown by the fact that wayleaves are often hard and dear to obtain, the objection being that much more time is required to work around the poles, in addition to the disadvantages of a "lozenge" of land that goes out of cultivation. If the work were done in these early stages by the supply authority under contract, as previously suggested, it would be necessary to justify our claim that a pole in the middle of a field causes little trouble or loss to the farmer, and the onus and penalty of placing a pole in an arable field would devolve upon tnose responsible for such a crime!

Summing up, we may state that for rural electrification to be a success the following are the main desiderata:—

(1) That there be an extensive and cheaply erected network of lines adjacent to land other than permanent pasture, either at a medium pressure of 200-400 volts or at a high pressure of about 3,000 volts. Considerations of cost demand that these should be single- or two-phase, if alternating current, or, alternatively, that they be direct current at, say, 200-800 volts. The former method would involve the use of a 10-15-kVA portable transformer to give a low-pressure supply. These lines would not be used entirely for the purpose of tapping for operations in the field, but they would help to justify the erection of a line to a scattered hamlet or even a farm for domestic use, where normally such a line would not be an economical proposition, and in this way they would *cheapen the cost of erection per mile*. An isolated farm or group of houses such as one commonly meets in rural areas is a fertile place for the installation of electrical apparatus as an aid to comfort, and will become increasingly so as the electrical gospel becomes more and more a part of our normal lives. Possibly it seems as strange to imagine electric ploughs or reaping machines let out on hire, or on a hire-purchase system, as it was to the people of Glasgow to conceive that the electric lamp first used in Lord Kelvin's house would become a commonplace object twenty years later.

(2) That wayleaves for poles be easily and cheaply obtainable. It may be pointed out that the apparently standard rents for poles which the Commissioners seem to be fixing, judging from the results of inquiries, of 8s., 4s., and 2s. per double pole, depending on their position, are far too high for successful rural distribution, and will militate against a reasonably cheap distribution in any except industrial areas with their large consumers.

(3) That initially the responsibility for work involving horses and machines be removed from the farmer to a competent supply authority (the work, of course, being done to his satisfaction) and that not only must the cost of operation per acre be less than previously but that the farmer must be enabled to reduce his overhead charges. Selling a horse which needs feeding with energy at a cost probably far higher per unit than that of electrical energy will enable him to purchase two motors for his dairy or granary.

Condition (1) rests not only with the farmer but with those responsible for the regulations governing the distribution and supply of electrical energy. An engineer recently wished to reduce the cost of overhead lines for 220 volts, a.c., and applied for permission to run a single wire with return *via* Mother Earth. He also had the audacity to state that the system of guarding required by the authorities for the crossing of power lines (e.h.p.) over telephone lines was unnecessarily cumbersome and costly. Why, for instance, should not the crossing and guarding be supported from wood poles instead of from the more expensive steel lattice towers? —and why, if the line were to break—a rather hypothetical happening—should such elaborate precautions have to be taken to ensure that they would not touch the earthed guard erected to catch them?! And he asked for permission to run the single wire, also to erect a cheaper crossing which would still have a sufficiently high factor of safety. Copernicus was not more ill-thought of, and the theological authorities are still debating the motion of the solar system. The question of being able cheaply to tap 33,000-volt lines also arises, since these lines are almost always run through fields and adjacent to the particular type of country with which we are concerned. It is possible to tap a 33,000-volt line at £25 (this being the cost of a 5-kVA transformer and switch), and the saving which may be effected in rural distribution if a tapping can be made from a 33,000-volt line at a cost of, say, £20, makes the matter extremely interesting and important.

Condition (2) will resolve itself, and may hardly be looked upon as a difficulty unless the Commissioners attempt to fix a standard price per pole.

Condition (3), which is in the nature of a suggestion, constitutes a difficulty in itself, and if a few authorities are willing to take over such a responsibility, it will be necessary for a large area to be guaranteed to be at their disposal each year. In any case it means the expenditure of a fair amount of capital which, although the writer thinks it would be covered, might only return a profit of perhaps 1 to 5 per cent.—the amount depending entirely upon the amount of work available. But if the farmer will go to the expense of purchasing, or at least hiring, a petrol-engined tractor plough, which he will state quite frankly does not do the work to his satisfaction, why should he not turn to electrical methods?

In conclusion, I would point out the essential difference between industry and agriculture: the former is mobile, in that it can gravitate to the locality where power is cheap and easy to obtain; but agriculture, with a possibly greater need for an abundant supply of energy available cheaply and easily, is immobile, and it remains a pressing problem for the electrical engineer to erect power lines which will be the means of conveying that energy to the fields and farms.

Monorail in Railway Workshops.—A New York correspondent of *The Times Trade and Engineering Supplement* states that in the shops of the United Railways of St. Louis a very complete monorail system handles various equipment parts with facility. This overhead system extends throughout the different departments of the shop, with branch lines running directly to the work benches and the machine tools. The monorails are so placed with respect to the machines that material is deposited adjacent to them and can be handled with the minimum of labour. Each important machine tool is served by a jib crane in addition to the monorail system. These jib cranes are so arranged that the heavy parts of trucks and railway motors can be lifted readily and placed in position on the tools for machining, an air hoist or a chain block being used, depending upon the height of the lift and the material being handled. In several cases the parts can be transferred directly from one machine tool to another without the intervention of the monorail system. This method of handling parts in the repair shop has effected a marked reduction in wasted time, with corresponding savings in the labour cost.

A Survey of Lighting in Electrical Showrooms.

By W. E. BUSH.

There can be few electrical engineers in this country to-day who are not aware that the methods of employment of electrical energy for lighting purposes are open to vast improvement. Throughout the length and breadth of the land are to be found innumerable examples of bad lighting. In fact, the actual state of affairs, at least so far as shop windows are concerned, is represented by diagram 1. From this it will be seen that 61 per cent. of retail shop windows are poorly lighted, while another 21.5 per cent. are only "fair."

Evidently here is matter for thought. In terms of £ s. d. the value of the field that lies between actual practice and best modern practice is estimated to be worth some £5,000,000. This, it is true, would go to the makers of and dealers in equipment and contractors for electrical wiring, but the increased consumption of electrical energy involved in this change would mean a considerable addition to the revenues of supply undertakings, since, even as things are at present, something like 46 per cent. of their total revenue is derived from "lighting." The difficulty, of course, lies in persuading the shopkeepers to adopt the best methods. Not only must they be told that efficient equipment is available which will mean an increase of income much beyond expenditure, but they must also be shown this equipment in actual use. As the well-known saying has it: "An ounce of practice is worth a pound of theory"; and this is undoubtedly true of electric lighting, for wherever the latest types of lighting units are seen in action their value is appreciated.

Hence it is obvious that in every possible way the electrical trade should set a good example to the ordinary shopkeeper.

Nevertheless, a survey of 139 showrooms of supply undertakings, made with a view to ascertaining how they stood in this matter of window lighting, revealed

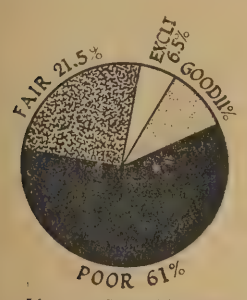

Fig. 1. – Shop Windows.

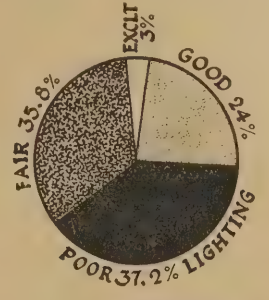

Fig. 2.—Showrooms.

some rather surprising figures. The standard by which they were judged was the same as that applied in the case of the general retail shops, namely, complete absence of glare, use of top reflectors, and the consumption of at least 90 watts per foot run of window. As will be seen from diagram 2, only 3 per cent. reached a level of excellence, while 73 per cent. varied between fair and definitely poor. In only 42.5 per cent. of the windows examined were top reflectors employed, and about an equal number were lighted by pendants, thus leaving more than 15 per cent. with bare lamps. Diagram 3 shows in a compact form the relative proportions in which these types of equipment were used.

After-hour lighting was employed by only 16 per cent. of the total, while just over 11 per cent. made use of colour lighting as a source of attraction. In only 17 per cent. of the cases considered were electric signs employed, in spite of the fact that most supply undertakings are to-day urging their customers to use after-hour lighting and signs as much as possible.

Indeed, on looking the matter squarely in the face, it seems as though the pupil is more learned than his master. A glance at the three diagrams will suffice to show that this is no unfair metaphor. Evidently such a state of affairs is far from desirable, since it involves the possibility of the electrical industry losing prestige as a force sincerely bent on serving the community. It must either lead or be led, and there can be no question as to which alternative it will adopt.

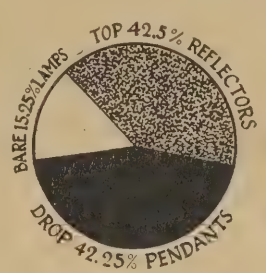

Fig. 3.—Types of Equipment.

During the next few months a great deal can be done to stimulate an interest in good shop lighting. Nearly half the supply undertakings have premises in good-class thoroughfares, and it is therefore possible for these to set such a standard in window lighting as to awaken in even the most apathetic shopkeeper a vague uneasiness not to be set at rest till he has given serious attention to the state of his own lighting equipment.

The Corrosion and Protection of Condenser Tubes.—A publication of the Institute of Metals, "Notes on the Corrosion and Protection of Condenser Tubes," has been prepared at the instance of the Corrosion Research Committee of the Institute by Messrs. G. D. Bengough, M.A., D.Sc., and R. May, A.R.S.M. It contains much new and important information on the subject which has been acquired since the last similar publication in 1921. Three types of factors are closely concerned with the subject of corrosion of condenser tubes, namely, chemical and electrochemical reactions, engineering and physical conditions, and metallurgical factors; on these the "notes" on the causes and methods of prevention of corrosion are based. Six types of corrosive action in condensers are named, and each is dealt with separately, the special conditions under which each action occurs being cited. Several causes of failure due to the tubes themselves are mentioned, the most important consideration in this direction being the composition of the metal. Such metals as lead, iron, manganese and nickel may be included in the composition of the tubes with advantage in a certain proportion, but harm may result from any of these elements being misproportioned. It is interesting to note that aluminium should be rigorously excluded. Great attention is paid to the causes of failure due to external conditions which call for consideration of the following factors: the nature of the vortex or other motion in the water box, the type of disturbance set up by the ferrules, &c., the occurrence of obstructions to flow in the tubes or ferrules even when very small, the size of air-bubbles, the foaming properties of the water, and the supersaturation of sea-water with gases. Of the possible methods of lessening corrosion, several are dealt with under the two main treatments, the water treatment and that of the tube itself. The methods of treating the water are classified as physical (filtration), chemical (softening, neutralisation, &c.), and electrolytic; while the tube treatment includes the following methods: protection by insoluble scales, by metallic layers (tin, lead, &c.), by impervious layers of inert substances, tube cleaning, and annealing at low temperatures in oxidising atmospheres. Each method is described and criticised in turn, and many valuable suggestions are given. Both treatments are given prominence, but the modern tendency seems to favour the tube treatment. Good results have been obtained by protecting the tubes by means of layers of basic salts and also by metallic layers. Unfortunately the annealing process has not given such good results in practice as were promised by the results of laboratory tests. The various methods of preventing corrosion and the fields of application of protective processes are given in tabular form. Considerable information as to the research at present being carried out is also included in the pamphlet.

Electricity Supply in Great Britain.—II.

The Situation in Kent.

In dealing with the County of Kent it will be found convenient to divide the authorised undertakers into two groups, *viz.*, Group 1, those included in the London and Home Counties Electricity District, and Group 2, those outside this District. The area covered by the latter is identical with Area No. 14 in the Electricity Commissioners' publication dealing with the Generation of Electricity in Great Britain, price 1s. 6d. In Table 8 of this pamphlet, the particulars of kWh generated by the different classes of stations are set out, together with the amount of fuel consumed by each class. The last column gives the total number of kWh generated in the area, as follows:—

Year ending March 31st,	1922	31,506,343
Do.	1923	39,716,403
Do.	1924	46,904,432
Do.	1925	55,869,304
Do.	1930 (estimated sold) ...	80,000,000

We have added our estimate for the output sold five years hence, and trust that the undertakers concerned (either individually or collectively) will not fail to justify our forecast. The portion of Kent not included in Fuel Consumption Area No. 14 is, as stated above, included in the London and Home Counties Electricity District. The London County Council publication relating to Electricity Supply in the London and Home Counties Electricity District deals very fully with this, and by putting both sets of particulars together one can obtain a fairly comprehensive record of the County of Kent for the last few years. On referring to the Electricity Commissioners' Volumes of Returns of Administrative, Engineering, and Financial details, it will be found that although the whole county, with the exception of the Isle of Thanet, is practically covered by the various Acts of the Kent, South East Kent, and West Kent Companies, the total annual output of these associated companies is only about ten million kWh sold, including bulk supplies given to other undertakers. As will be seen from the map on the opposite page, the north-west corner of Kent, which lies within the new Electricity District recently confirmed by Parliament, is practically covered by statutory powers.

The whole administrative County of Kent, together with the County Borough of Canterbury, comprises 975,965 acres. According to the 1921 Census, the population comprised 1,141,666 persons and 252,936 resident families. Table 10 shows that there were 12,892 buildings not containing dwellings, so that in all we may reckon that there are about 266,000 potential consumers.

The following is a list of the generating stations in Kent:—

(1) London and Home Counties Electricity District.
Gravesend Corporation.
Beckenham Urban District Council.
Bexley Urban District Council.
Dartford Urban District Council.
Erith Urban District Council.
Sevenoaks and District Electric Co., Ltd.
Bromley (Kent) Electric Light and Power Co., Ltd.
Total—7 stations.

(2) Area No. 14 of Generation of Electricity pamphlet (*i.e.*, the remainder of Kent).
Canterbury Corporation.
Faversham Corporation.
Dover Corporation.
Maidstone Corporation.
Tonbridge Urban District Council.
Tunbridge Wells Corporation.
Gillingham Corporation.
Chatham and District Light Railways.
Isle of Thanet Electric Supply Co., Ltd.
Ramsgate and District Electric Supply Co., Ltd.
Folkestone Electric Supply Co., Ltd.
Whitstable Electric Co., Ltd.
Sheerness and District E.P. & T. Co., Ltd.
Kent Electric Power Co. (Rochester).
Total, 14 stations.
Grand total, 21.

The number of authorised undertakers in Kent at the present time is 26. The area of supply of 23 of these is wholly within Kent, the exceptions being the Weald Electric Supply Co., Ltd., the South Metropolitan Electric Light and Power Co., Ltd., and the Sevenoaks Company. The Weald Company's area extends into Sussex, but as this company has not yet commenced operating, having only just been formed, it will not affect the totals given below. The part of Kent belonging to the South Metropolitan Company is Penge Urban District, and as separate figures are not available for this area, this undertaking is omitted from the following figures. At present, we believe, no electricity is supplied by the Sevenoaks Company to the part of its area outside Kent. The South-East Kent Electric Power Co., Ltd., is also omitted, as it is not now operating. The remaining 23 undertakers have been divided into two groups, as stated above. The Kent Electric Power Company belongs to both groups, but only appears in Group 2, as it is not operating in Group 1.

	Max. Load, kW.	Total kWh sold.
Total for Undertakers in Group 1 ...	13,199	27,301,226
Total for Undertakers in Group 2 ...	16,338	29,283,657
Aggregate for the whole county ...	29,537	56,584,883

These data are the latest published by the Electricity Commissioners, except that the maximum load of the West Kent Electric Co. is assumed to be 2,000 kW.

It is interesting to note that 20 of these 23 undertakers possess generating stations, as can be seen from the map. The Chislehurst, Foots Cray and West Kent Companies purchase the whole of their output.

Space does not permit of a detailed list being given, showing the respective areas of each of the 26 undertakers in Kent, but the information is very clearly set out in the Electricity Commissioners' 10s. volume, published in January, 1925. The only additions to be made since December 31st, 1923, are that the area of the Isle of Thanet Electric Supply Co., Ltd., has been enlarged by the inclusion of the parishes of Westgate-on-Sea and Birchington; and that the new undertaker—the Weald Electric Supply Co.—does not appear prior to 1924. It possesses full powers for electricity supply over the following areas:—Cranbrook Rural District; Tenterden Municipal Borough; Tenterden Rural District (except detached portions); and Ticehurst Rural District (Sussex).

The map is based upon the Ordnance Survey map prepared for the Boundary Commission of 1917, which has been used by permission of the Controller of H.M. Stationery Office. As before, the hatched portions represent the areas already covered by statutory powers, either granted or applied for. Over part of its area the West Kent Electric Company has special powers to distribute electricity to consumers, besides supplying in bulk, and this part has been shaded with dotted lines, with the exception of the parishes of Darenth, Fawkham, Hartley, Horton Kirby, Longfield, and Southfleet, in Dartford Rural District; these parishes form part of the area applied for by Gravesend Corporation, and are shaded therefore by full lines.

The following alterations have been made since the map was engraved:—

(1) Crayford Parish has been created an Urban District.
(2) A small part of Tonbridge Rural Parish has been added to Tonbridge Urban District.
(3) A small part of River Parish has been added to Dover Municipal Borough.
(4) The parish of St. Lawrence Intra has been merged into the parish of Ramsgate, which is now co-extensive with Ramsgate Municipal Borough.
(5) The Urban District and Parish of Footscray has been re-named Sidcup.

Electricity Supply in the County of Kent.

D

Reviews.

Mercury Vapour Rectifiers and Mercury Vapour Lamps. By J. A. Fleming, M.A., D.Sc., F.R.S. Pp. viii + 100; figs. 44. London: Sir Isaac Pitman & Sons, Ltd. Price 6s. net.

This work by Professor Fleming is described by him in the foreword as "a small treatise on the modes of operation and uses of the mercury-vapour rectifier and the mercury vapour lamp."

The author devotes the first two chapters to a *résumé* of the atomic structure of matter and of electricity, and to the phenomena observed in the ordinary carbon arc. The account of the atomic theory is worth reading for itself, and is one of the clearest non-technical descriptions on the subject that we have seen.

The third chapter describes the mercury-vapour lamp in glass and in quartz and gives concrete examples of the theories introduced in the previous chapters. We are surprised that more space has not been devoted to the therapeutic uses of the mercury-vapour lamps in quartz. This "artificial sunshine" so beloved of the daily Press is of great and ever-increasing importance in the treatment of tuberculosis and certain skin diseases. Very valuable work is being done in this country and on the Continent, and it would seem that before many years have elapsed medical practitioners will make extensive use of the "ultra-violet" light of which the mercury-vapour lamp in quartz is the only commercial source at present.

To purely electrical engineers the mercury-vapour lamp is of greater interest as a source of light for general illumination. The author would have assisted them very greatly had he given comparative data of the cost of this lamp and the gas-filled metal-filament lamp.

Chapter IV deals with the glass bulb rectifier made by the Hewittic Electric Company, and Chapter V with the metal cylinder rectifier made by Messrs. Brown, Boveri.

These two chapters give fairly good accounts of both types of rectifier, but contain no more information than may be obtained from literature supplied by the respective manufacturers. The blocks also with but few exceptions have been obtained from the same sources. The same criticism applies with equal force to the chapter dealing with mercury vapour lamps, and we feel that six shillings is too much to ask for 100 octavo pages of such compilation.

An operating engineer's first consideration when choosing plant is reliability, his second, overall costs. If he seeks for information regarding first costs, running costs, and maintenance charges in this book, he will seek in vain. Neither is anything said about the parallel running of mercury-vapour rectifiers with other machines or with other and similar rectifiers.

In the absence of information to the contrary it must also be assumed that motors, supply meters, and instruments do not differentiate between rectified current and d.c. current obtained from dynamos or converters. We believe this is the case, but some engineers have an exaggerated idea of the amount of ripple and are afraid of its influence on their mains and outside plant. We think the various makers would do well to dispel these fears by publishing oscillograms and by practical demonstrations.

It is true that the author refers his readers to a paper by Mr. G. Rogers published in the I.E.E. *Journal* for February, 1925, but we think that a publication aspiring to be a treatise on the subject for the use of engineers should contain within itself adequate data on these all-important questions.

The final chapter deals with the mercury-vapour lamp as a generator of oscillations. This is mainly of theoretical interest and will interest those engaged in high-frequency work.

In conclusion, the book cannot be said to merit the title of a treatise. The information contained therein is certainly accurate, but very meagre. It forms, however, a useful introduction to the subject and then, we fear, engineers desiring fuller information will have to look abroad.

The only English works known to the writer are Mr. L. B. Jolley's book on "Alternating Current Rectification," which was noted in these columns on March 27th, 1925, and the paper by Mr. G. Rogers previously mentioned. The latter is the better one for the operating engineer. It deals almost entirely with the glass-bulb rectifier with which Mr. Rogers has had considerable experience and gives detailed costs.

For similar articles dealing with the metal cylinder genus the reader will be forced to turn to the pages of the *Elektrotechnische Zeitschrift* and the *Revue Générale d'Electricité*. The latter paper has from time to time very interesting articles on the theory of the rectifier, but their reading demands a high standard of French and mathematics.

In passing, it may be said that both types of rectifier are very extensively used on the Continent, but that this country and, singularly enough, the United States have considerable leeway to make up.

Fuel Economy and Smoke Prevention. By J. B. C. Kershaw, F.I.C. Pp. xiii + 268; figs. 91. London: Constable & Co., Ltd. Price 16s. net.

The book under review is the third revised edition of "Smoke Prevention and Fuel Economy," by Mr. Kershaw and the late Mr. W. H. Booth. It has undergone considerable revision and has been extended by additional chapters dealing with the grading of fuel, utilisation of waste steam, and descriptions of recent super-power stations.

Coal will probably remain the principal source of fuel for the world at large, and one of mankind's most pressing problems is how to best use economically, and hence conserve the fuel resources of the world. Low-temperature carbonisation has attracted considerable attention within recent years, but the economic aspect of the question still bristles with technical problems which are now being studied on industrial plant. At present, improvements in the efficiencies of steam-raising plant are being fostered in all parts of the country, and the recently-built large municipal stations have made vast strides in this respect, but it must not be overlooked that by far the larger proportion of fuel is consumed in the smaller plant, the efficiency of which is low. The proposal to establish super power plant at industrial centres throughout the country could not entirely supersede the smaller plants, as the latter supply steam for industrial heating purposes at the factories where they are situated, and no super power plant, however well situated, could attempt to distribute exhaust steam or hot water over a wide area with any degree of efficiency or economic success. The low thermal efficiency of many present-day boiler plants, is due, generally, either to insufficient air supplied at the periods when the hydro-carbon gases are being evolved most rapidly from the fuel, or no proper provision is made for adequate mixing of the heated air and of these hydro-carbon gases. In practice, from 20 to 25 lb. of air is used per pound of fuel, and hence the amount which must be carried either through the fuel or above it into the furnace amounts to between 40,000 and 55,000 lb., or to the enormous volume of between one-half and three-quarters of a million cubic feet per ton of coal burnt. The shortcomings of the present-day methods of burning fuel for steam generation are partly due to faulty boiler and furnace design, and partly due to lack of supervision and efficiency in the operation of the plant. In some of the recently-built power plants, many of these defects have been remedied. The efficiencies of 250 power plants are summarised by Mr. Kershaw, as follows: 98 had efficiencies ranging from 60 to 80 per cent., 109 between 50 and 60 per cent., and 43 of efficiency below 50 per cent. The average efficiency of power plant is highest at paper mills, *viz.*, 71 per cent., compared with 41 per cent. at colliery power plant, which is the lowest; these are significant figures.

In every power plant, large or small, there is scope for the exercise of much ingenuity, and engineering ability in devising inexpensive and simple means for the recovery of the waste heat units.

As the necessity for fuel economy becomes more urgent, it would be well for the chemists and engineers in charge of this highly important section of the plant of our manufacturing industries to examine their steam raising installations, in order to further conserve or recover wasted heat units, without unduly increasing the capital outlay or running costs of the plant. Many problems remain to be solved in this field, and it is important to have in a narrow area of reference, most of the material that makes possible a sorting out of the elements of fuel economy. The whole formation of the book is admirable, illustrations are good, it is well written and interesting alike in the facts it records, and the theories it evolves. The method of presentation of the material is logical and the facts are put forward with clearness and conciseness.

The fairest comment that can be made upon the book, is that the author has accomplished that which he set out to do, and those interested in fuel economy, thermal efficiency, and smoke prevention are indebted to Mr. Kershaw for an extremely useful and stimulating volume. One general criticism should perhaps be registered, and that is the omission of a bibliography.

The Motor-car Show.—The International Motor Exhibition which opened at Olympia on October 8th, has been regarded as the most important of the series from the trade point of view, for there has been no Paris *salon* this autumn. The popularity of the British show is not surprising when the figures issued by the Ministry of Transport last week relative to the number of motor licences in Great Britain from December 1st, 1924, to August 31st last, are considered. The gross receipts amounted to £16,025,527 and the number of motor vehicles for which licences were taken out, excluding tramway-cars, is given as 1,510,000, including: 580,000 cars, taxed on horse-power; 572,000 motor-cycles; 224,000 commercial goods vehicles, and 99,000 motor-hackneys (otherwise omnibuses and other vehicles for hire). The number of motor-cars (580,000) works out at approximately one to every 78 of the population, whereas in America there is one car to about every 11 of the population. The total number of motor vehicles, including those exempt from licences, is given as 1,537,340. The electrical features of the exhibition, which will be dealt with next week, are confined to the lighting, starting, and ignition equipment.

The Manchester Textile Exhibition.—Radical development or alteration in principle of textile machinery has been almost negligible for many years. Nevertheless, new ideas are being promulgated and an inspection of the many exhibits now on view at the City Hall, Manchester, will impress the observer with the fact that great progress is being made. New and radical changes are proposed in many directions, with a view to economy in production, increased output, and better quality of product. A novelty is an electro-automatic loom, details of which we hope to publish in due course, but our review of the show has to be unavoidably held over until next week.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities New Publicity Literature, Liquidations and Failures.

Electrical Activity Abroad.—Several matters of interest have appeared in foreign dispatches to the daily Press during the past week. First the development of the Brown, Boveri schemes in the United States has been before the American investing public, which has quickly absorbed at $50 a share an issue of 260,000 participating shares of the American Brown, Boveri Electric Corporation, in which the well-known Swiss company has a large holding. The intention of the Swiss company to exploit the American market, purchasing a number of individual plants for conversion to its own requirements, has already been fully discussed in these pages. Swiss activity is also noticeable in another of the foreign dispatches, for a *Times* report from Frankfurt states that in connection with the electrification of the railways of the Reich, in the Rhineland, three new power stations are to be erected—partly on Swiss territory—at a cost of £2,240,000. It is added that the concerns financially interested in the scheme are: the North-Eastern Swiss Power Works, the Rheinefelden Transmission Works, and the Baden Works in Karlsruhe. The other report before us relates to Germany and Russia, and it is not one to be viewed with surprise. It is to the effect that an agreement was last week approaching completion between the Russian Elektrotrust and the Allgemeine Elektrizitäts Gesellschaft, by which the former concern will have the right to make use of the A.E.G. technical experience and patents, the company having undertaken to "exchange" technical experience and patents for increased facilities for the sale of A.E.G. products in Russia. So many statements have emanated from Russia lately showing that foreign technical experience and products would have to be resorted to if Russian electrification was to proceed satisfactorily, that the reported discussion does not startle one. A daily paper states that one part of the discussion relates to a large delivery of goods to Russia by the company, for which the Russians require a payment credit of 40,000,000 marks.

The Shannon Scheme Dispute.—The position with regard to the delay of the work on the Shannon scheme has grown more acute, the trade bodies giving support to the unskilled workers, who refuse to accept the wage terms offered by the German contractors, *viz.*, 32s. for a 50-hour week. The Limerick dockers are in sympathy with the men, and no further consignments of equipment are to be handled by them pending a satisfactory settlement. Negotiations between the contractors' representatives, the Free State Government's Labour Director and the men's union, have led to no result. It is stated that the Transport Union has set up a negotiating committee to deal with all questions of wages and conditions of work and that until Messrs. Siemens-Schuckert, the contractors, negotiate with this body no work will be done. The firm, however, shows no disposition to negotiate.

Social Events.—Messrs. Johnson & Phillips, Ltd., of Charlton, held their first staff dance of the season on Friday evening last, October 9th, at the Woolwich Town Hall. Over 250 members and friends were present, and the function was most successful in every way. Prizes were given for "lucky numbers" and "spot" waltzing.

Burnley Electricity Works has won the local cricket club medal competition. The medals were presented to the team by Mr. Starkie, the borough electrical engineer.

The employés of Messrs. C. T. Briscoe & Son, electrical engineers, Blackburn, went for a motor outing to Blackpool on Saturday.

B.I. Works Visit.—Liverpool has just celebrated a Civic Week. Special efforts were made to provide attractions for the great influx of visitors to the city. The Prescot factory of British Insulated & Helsby Cables, Ltd., was thrown open to visitors throughout the whole week. A very considerable number of people took advantage of the opportunity of inspecting the plant and processes for the manufacture of the company's "Prescot" paper-insulated cables.

Belgian Tariff Reductions.—Under a convention with Germany, the Belgian authorities have reduced the import duties on electrical carbons and electric irons weighing less than 10 kg. each. Great Britain also participates in these reductions with other countries entitled to "most-favoured-nation" treatment.

Searchlight Vehicles for Czecho-Slovakia.—It is reported in the financial Press that Messrs. Tilling-Stevens Motors have recently completed an order for the Government of Czecho-Slovakia for searchlight vehicles.

Canadian Electric Power Report.—H.M. Trade Commissioner at Toronto (Mr. G. F. Braddock) has forwarded to the Department of Overseas Trade a copy of the "Statement and Engineering Report by the Hydro-Electric Power Commission of Ontario," submitted to the International Joint Commission respecting the proposal to develop the St. Lawrence River. This is available for loan to British firms interested in order of application to the Department of Overseas Trade (Room 52), 35, Old Queen Street, London, S.W.1. Copies may be purchased from the Commission at $7.50 per copy.

Trade Announcements.—Messrs. L. McMichael, Ltd., have opened new head offices at Wexham Road, Slough. The London offices, Hastings House, Norfolk Street, Strand, W.C., will continue as wholesale showrooms.

The telephone number of the Charing Cross Electricity Supply Co., Ltd., 60, St. Martin's Lane, W.C.2, is now "Gerrard 9134 (4 lines)."

Messrs. R.I., Limited, have appointed Mr. Michael Black, 11, West Nile Street, Glasgow (telephone numbers 917 and 918; telegraphic address "Faneeka, Glasgow") their representative for the whole of Scotland. He will hold a large stock of all "R.I." components and sets, and a special showroom has been opened for trade purposes.

The Ilford Electrical Co. have commenced business at 36, The Hill, Ilford. Catalogues, &c., are asked for.

Messrs. R. A. Rothermel, Ltd., 24 and 26, Maddox Street, Regent Street, London, W.1, announce that owing to increased business the radio section has been taken over by the Rothermel Corporation of Great Britain, Ltd.

Messrs. Carrington & Button, electrical engineers, 44, High Street, Crewe, have opened a new showroom for electrical fittings, glassware, &c.

Catalogues and Lists.—Messrs. Ransomes, Sims and Jefferies, Ltd., Orwell Works, Ipswich.—An illustrated catalogue describing various designs of "Orwell" electric industrial trucks.

Metropolitan-Vickers Electrical Co., Ltd., Trafford Park, Manchester.—Leaflet 293/1-1, describing truck type switchgear; 301/8-1, dealing with sheet steel cubicle switchboards. Illustrated.

Messrs. Fredk. Braby & Co., Ltd., Petershill Road, Glasgow.—40-page catalogue of structural steelwork; 16-page publication showing steel storage bins.

East London Rubber Co., Ltd., 29-33, Great Eastern Street, London, E.C.2.—Catalogue of over 200 pages prepared on the loose-leaf system, allowing for additions to be made, detailing, illustrating and pricing a very wide range of wireless sets and parts for the trade.

Messrs. Watson & Sons (Electro-Medical), Ltd., Sunic House, Parker Street, Kingsway, London, W.C.2.—12-page pamphlet, describing and illustrating apparatus for the high tension testing of cables and overhead lines by d.c. Illustrated booklet describing hot-cathode valve apparatus for h.p. cable testing with d.c. Illustrated and priced 30-page bulletin No. 73 (supplementing catalogue, Part III, Section 5), describing lamps and apparatus for ultra-violet or artificial sunlight treatment.

Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, London, E.C.4.—Two small and effective showcards, advertising Siemens-Xcel electric irons and vacuum cleaners. A catalogue of ceiling and bowl fittings, and booklet of "Silvalux" colour sprayed enamelled lamps. Illustrated and priced. The booklet also contains useful information for wireless users.

The Marconiphone Co., Ltd., Marconi House, Strand, London, W.C.2.—A number of new publications, each of which deals with one of the following lines:—Sterling loud speakers and amplifiers; Sterling receiving sets and accessories; Marconiphone auto series parallel variometer; "Ideal" transformers; Sterling Super "Invicta" battery; Marconiphone receivers and amplifiers; Marconi valves and "Die-cast" variable condensers.

Messrs. Garnett, Whiteley & Co., Ltd., Lotus Works, Broadgreen Road, Liverpool.—Priced leaflet of the Lotus vernier coil holders. Show-card in preparation.

Automatic Telephone Manufacturing Co., Ltd., Liverpool.—16-page list, giving illustrated particulars and prices of the "Xcel" electric domestic appliances. These products are being handled by Messrs. Siemens & English Electric Lamp Co., Ltd., who are supplying quantities of over-printed pamphlets when desired.

Messrs. McKechnie Bros., Ltd., Rotton Park Street, Birmingham.—New edition of their catalogue (24 pp.) of extruded rods, sections, stampings, chill cast bars, and ingots in non-ferrous alloys. Four pages of handy tables.

Z Electric Lamp & Supplies Co., Ltd., 73, Newman Street, Oxford Street, London, W.1.—Compact set of pocket tables of prices of various brands and types of lamps manufactured by members of E.L.M.A.

The Benjamin Electric, Ltd., Brantwood Works, Tariff Road, Tottenham, London, N.17.—Illustrated particulars of their new "Biflector" fittings, shop window fittings, hand lamps, wireless switches, &c., and views of the works are given in the company's September Bulletin.

Ateliers de Constructions Electriques de Charleroi, Charleroi.—October pamphlet, showing motors and dynamos in stock at Charleroi.

Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., U.S.A.—A booklet describing electric railway material for mines. Illustrated. Also leaflets showing Westinghouse furnace elements, single retort underfeed stokers, measuring instruments, electrical equipment for paper machine drive, type "KD" generator and feeder panels, and motors for Baldwin-Westinghouse mine locomotives.

Messrs. Rose Bros. Electrical Co., Ltd., 25, Milton Street, London, E.C.2.—Priced catalogue of various electrical accessories. Illustrated.

Messrs. C. H. Parsons, Ltd., Britannia Works, Tyseley, Birmingham.—An illustrated and priced list of "Britmac" switches and lampholders.

Automatic and Electric Furnaces, Ltd., Elecfurn Works, 173-175, Farringdon Road, E.C.1.—A booklet containing illustrations, details, and prices of Wild-Barfield electrically-heated industrial ovens.

Superlamp, Ltd., 92-94, Paul Street, Great Eastern Street, E.C.2.—A net trade price list of wireless accessories.

Bowen Instrument Co., 9, Newton Road, Leeds.—An illustrated catalogue and price list describing the "Pyro" radiation pyrometer.

The Sun Electrical Co., Ltd., 118 and 120, Charing Cross Road, W.C.2.—An illustrated and priced catalogue of electric fires of various makes, including "Sunco" fires and radiators.

Messrs. Philips Lamps, Ltd., 60, Wilson Street, Finsbury Square, E.C.2.—Two specimens of a coloured blotter depicting the "Argenta" lamp and girl.

The British Thomson-Houston Co., Ltd., Rugby.—A catalogue showing various designs of "Mazda" electric lamps, also a leaflet describing "Mazda" electric decoration lamp outfits. Illustrated and priced.

The London Electrical Co., 1, Sherborne Lane, King William Street, E.C.4.—A net trade price list of electrical materials and accessories, also an illustrated and priced catalogue of electric fires and other domestic appliances.

Messrs. Johnson & Phillips, Ltd., Charlton, S.E.7.—An illustrated booklet, describing various designs of a.c. and d.c. switchboards.

Messrs. Callender's Cable & Construction Co., Ltd., Hamilton House, Victoria Embankment, E.C.4.—An illustrated catalogue describing the C.S.W. type of network boxes.

Messrs. Siemens Brothers & Co., Ltd., Woolwich, London, S.E.18.—36-page catalogue 595, revised edition, particularising and showing reduced prices of wireless sets and accessories. The new type large capacity radio batteries are now included and fully described.

The Arora Co., Rosebery Street, Loughborough.—An illustrated and priced folder describing "Arora" cooking apparatus.

Messrs. Joseph Adamson & Co., Hyde, Cheshire.—Pamphlet containing well illustrated matter relating to their horizontal flame tube type waste heat boilers.

Electric Fires, Ltd.—Booklet No. 44. An illustrated catalogue and price list of the "Heatrae" products.

Metro-Vick Supplies, Ltd.—Envelope series No. 4150/9. Deals with several new designs of electric fires. Illustrated and priced.

M. P. Dieny, 20 and 21, Laurence Pountney Lane, Cannon Street, London, E.C.4.—Illustrated list describing the "Wyss" belt-tightening device made by Wyss & Cie, Seloncourt, France.

Bankruptcy Proceedings.—Cyril Bertram Maurice, 14-15, Windsor House, Victoria Street, London, S.W., electrical merchant.—The public examination of this debtor was held on October 6th, before Mr. Registrar Francke at the London Bankruptcy Court, the accounts showing liabilities £745 and assets "nil." Replying to the Official Receiver, debtor said that when he was demobilised in 1919 he commenced business in partnership with another person as electrical merchants and factors at 59-61, New Oxford Street, under the style of Catchpole & Maurice. The assets and liabilities of that business were taken over in June, 1920, by a company then formed to acquire it; as one of the vendors witness received £1,000 in shares, and he acted as director until March, 1924, when the company (Catchpole & Morris, Ltd.), was wound up, his shares being then of no value. Witness next started business as an import merchant at 14-15, Windsor House, where he traded until his failure, which he attributed to his inability to obtain electrical supplies from abroad to meet orders; to loss of £300 in a bookmaking business, which he carried on from May, 1924, to January, 1925, and to law costs. The debt of the petitioning creditors (The C.A.T. Cable Co., Ltd.), was in respect of cables supplied in part execution of his order and for which he was unable to pay when called upon to do so. The examination was concluded.

W. C. Rhodes (L. J. Palmer & Co.), electrical engineer and contractor, 141, Newspaper House, Corporation Street, Birmingham.—Receiving order made October 1st on debtor's own petition.

First meeting, October 19th, at the Official Receiver's office, 191, Corporation Street, Birmingham; public examination, November 11th, at the Court House, Birmingham.

J. R. Pattison, electrical supplies factor, 15, Goldsmith Street, Nottingham.—Last day for proofs for dividend, October 24th. Trustee, Mr. L. A. West, Official Receiver, 4, Castle Place, Nottingham.

L. Backhouse, C. H. Thornton, and S. Evans (Arc Electrical Co.), electrical and wireless suppliers, Palatine Buildings, Victoria Street, Manchester.—Trustee, Mr. A. T. Eaves, 15, Fountain Street, Manchester; released, September 17th.

T. A. Wickham, electrical engineer, Snaresbrook, Station Road, New Milton, Southampton.—Receiving order made October 1st, on debtor's own petition.

H. Fildes, electrical engineer's superintendent, Durham House, 108, Monton Road, Eccles.—First and final dividend of 20s. in the £ and 4 per cent. interest, payable at the Official Receiver's offices, Byrom Street, Manchester.

W. R. J. White (W. R. White), electrical agent, Golden House, 29, Great Pulteney Street, W.—Application for discharge to be heard October 27th at Carey Street, W.C.

G. J. C. Thorne and A. H. Thorne (Lawrance Electrical Trading Co.), electrical engineers, late of 159, High Street, Notting Hill Gate, W.—Last day for proofs for dividend, October 27th. Trustee, Mr. D. Williams, Official Receiver, Carey Street, W.C.

S. H. Bardwell (Bennett, Bardwell & Co.), electrical engineer, 22, Church Street, Basingstoke.—First meeting, October 16th, at the Official Receiver's office, Midland Bank Chambers, High Street, Southampton. Public examination, November 10th, at the Castle, Winchester.

H. McClelland, wireless apparatus merchant, 12, Leigham Avenue, Streatham Hill, S.W., and late of 48, Strand, W.C.—Receiving order made October 6th, on creditors' petition.

Company Liquidations.—Connolly Bros., Ltd. (old company).—Liquidator, Mr. I. M. Henderson, 2, Moorgate Buildings, E.C.2, released September 2nd.

Carter & Mitchell, Ltd.—Meeting of creditors at the office of the liquidator, Mr. C. Latham, 78, New Oxford Street, W.C., on October 22nd. Particulars of claims to the liquidator by November 23rd.

Dissolution of Partnership.—Wood & Tennant, electrical engineers, London Road, Alderley Edge, Chester.—Messrs. F. Wood and E. Tennant have dissolved partnership. Mr. Wood will attend to debts.

Private Arrangements.—W. D. Edwards and S. Fordyce, trading as Edwards & Fordyce, electrical and wireless dealers, 302, Upper Richmond Road, East Sheen, S.W.14.—The creditors interested herein were called together on October 5th at the offices of Messrs. Wilkinson, Howitt & Co., solicitors, 14, Bedford Street, W.C., when Mr. Littlewood reported that the liabilities amounted to £1,036, and the assets consisted of stock £520, valued at £200, and book debts £291, estimated to produce £200. It would appear that the sheriff was in possession and was entitled to sell almost immediately. Mr. Littlewood said that he was instructed to put forward an offer of 10s. in the £ in cash. Replying to Mr. W. Baker, of the Wholesale Traders' Association, Mr. Littlewood said that the business was commenced about five years ago with a capital of £500. There was an amount of £358 due to the bank but that claim had been guaranteed to the extent of £300. The drawings for the year ended December 31st, 1924, were £544. At that date creditors' claims amounted to £1,383. It was also stated that the stock consisted mostly of wireless accessories. After some discussion it was decided to accept the proposed composition of 10s. in the £, payable forthwith, and a small committee was appointed, consisting of Mr. W. A. H. Osborne, representing creditors, Mr. E. H. Hawkins, representing creditors, and Mr. Smith (Foster Engineering Co.). The following are creditors:—

	£		£
British Thomson-Houston Co., Ltd.	64	Pope's Electric Co.	51
Falk, Stadelmann & Co., Ltd.	70	Foster Engineering Co.	76
Edison Swan Electric Co., Ltd.	31	Sun Electrical Co.	20
Jones, F. E.	77	Berry's Electric Co.	32
Spicer Bros.	21	New Syneigi Co.	31
Z. Electric Co.	127	Edwards, C. A.	300
Brompton Accessories Co.	20	Bankers	58
General Electric Co., Ltd.	28	Portable Electric Light Co.	20

Unemployment.—The number of unemployed recorded on October 5th was 1,297,600; this was 38,555 fewer than the previous week, but 82,025 more than a year ago.

Transport Costs.—The Wholesale Produce Merchants' Association has invited Mr. C. Holmes Waghorn, A.M.Inst.C.E., to read a paper entitled "Increasing Profits by Reducing Transport Costs—Improvements in Delivery Systems for Provision Merchants." It will be delivered at 2.30 p.m. on October 28th, at the London Provision Exchange, Hibernia Chambers, London Bridge. The speaker, while dealing with all kinds of road transportation, proposes to refer especially to electric battery vehicles, traffic congestion, and loading dock and garage design.

Our Foreign Trade.—September Figures.—The Board of Trade returns for September show the following values of electrical imports and exports:—

	September, 1925.	Inc. or dec.	9 months, 1925.
Imports.—			
Electrical goods and apparatus	336,091	+ 7,696	+ 815,995
Machinery	857,750	+ 58,398	+1,189,806
(Electrical machinery)	97,202	+ 14,118	+ 51,358
Exports.—			
Electrical goods and apparatus	1,159,974	+307,295	+1,730,826
Machinery	3,959,151	+345,898	+3,848,691
(Electrical machinery)	376,269	− 46,363	+ 557,642
Re-exports.—			
Electrical goods and apparatus	11,424	− 4,493	+ 59,901
Machinery	88,301	− 12,435	+ 214,685
(Electrical machinery)	4,372	+ 56	− 21,641

United States Tariffs.—The U.S. Customs authorities have lately given a decision that "magnetos, dynamos, starters, switches, and parts of said articles comprising the ignition and lighting system for use as parts of automobiles" are dutiable at 25 per cent. as "parts of automobiles finished or unfinished" under No. 369 of the tariff.

For Sale.—Great Yarmouth Corporation Electricity Department invites offers for surplus generating plant owing to the change of system of supply. Mr. H. J. Shaw will sell by auction on October 27th, at 85, Newington Causeway, S.E., the stock of an electrical and wireless goods factor. Manchester Corporation Electricity Committee has for disposal 40 weldless-steel lamp columns and 48 11-amp. magazine flame arc lamps with winches, &c. (See our advertisement pages to-day.)

Japanese Electrical Notes.—Our correspondent says it is reported that the Toso Tetsudo K.K., whose head office is at Aoshima-machi, Shizuoka-ken, has made healthy progress since its establishment and it plans electrifying its whole railway line shortly by doubling its capital of 1,200,000 yen. The project to organise the Seikai Electric Co. is making steady progress under Mr. T. Mirayama, M.P., and Mr. K. Tsuruya, a leading resident of Goshokawahara-machi, Aomori-ken, together with twelve others. The capital will amount to 600,000 yen, of which 375,000 yen will first be paid up. The company will be organised in about December. There will be two hydro-electric power stations, one with 250 kW and another with 150 kW, the completion of which is expected in 1926. With reference to a trackless electric railway project between Yamaguchi and Yuda, Kyushu, it is understood that it is desired to carry it out by the date of an exhibition to be held in the town of Yamaguchi, and an order for motor-cars has been issued to the Hidachi Works. A letter from the same works to Mr. Kasuya, the director of the Electric Bureau of the Yamaguchi Prefectural Office, says that it has been decided to equip the cars with a.c. 3-phase induction motors instead of d.c., the latter being unsuccessful.

Application has been made to the Railway Department by the Seidaiji Light Railway Co. for permission to extend its line for 32 miles, the estimated cost of construction being 4,300,000 yen.

During May, 1925, the following power stations were granted charter :—

Location.	Company.	Name of power station.	Steam or water power.	Electric power. (kW.)
Cifu	Oshirakawa Denryoku K.K.	Hirase ...	Water power	7,004
Cifu	Ibi-gawa Denki K.K.	Nishihira ...	,, ,,	3,700

German Failures.—The *Financial Times* states that the number of bankruptcies in Germany during September increased by 171 to 896. The total number of bankruptcies in the third quarter of this year amounted to 2,409, against 2,786 in the corresponding period of last year.

New Telephone Works.—The financial Press reports that in a recent speech Sir Max Muspratt announced that the Automatic Telephone Manufacturing Co., Ltd., which now employs 3,000 to 4,000 people, was about to build additional works in Liverpool.

Lead.—Messrs. James Forster & Co. reported on October 10th that in this country consumption was decreasing slightly, but there was still a shortage of metal in spite of recent imports of lead from the Continent; it was, however, easy to see what course prices would take should the settlement of the shipping strike coincide with freer offerings of lead from America.

Russia to Import Miners' Electric Lamps.—A Reuter Trade Service dispatch from Moscow states that the Yugostal Trust has applied to the Glavmetall for permission to import 9,000 miners' electric lamps for use at the Novo-Smolianinov mines.

Bankruptcy Order Annulled.—H. Fildes, electrical engineer's superintendent, Durham House, 108, Monton Road, Eccles.—Adjudication and receiving order of July, 1925, annulled October 6th, 1925; debts, interest, costs, charges and expenses of the bankruptcy having been paid in full.

Commercial Electrical Travellers' Concert. — The Bohemian concert of the Electrical Trades Commercial Travellers' Association, held on Saturday last at the Manchester Hotel, E.C., was very well attended. During the evening Mr. A. E. Joyce, the chairman, spoke upon the objects and achievements of the Association, and referred to the large amount of good work already done by the Association in spite of its tender age. The vice-chairman, Mr. A. S. Marks, also spoke upon the Association, and gave a list of further social functions arranged by the Entertainment Committee. It was felt that the successful nature of the evening augured well for the further events arranged by the indefatigable entertainments' secretaries, Mr. L. Moir and Mr. J. M. Woolnough, and their band of willing helpers.

Book Notices.—We have received a copy of the first part of "Modern Advertising" (London: Sir Isaac Pitman and Sons, Ltd. 2s.), which is to be completed in 20 fortnightly parts. It contains a number of articles by leading exponents of the business and practice of advertising and publicity, whether through the Press, on the sky, by means of illuminated signs, posters, films, or in shop windows. The preparation of "copy," the lay-out of advertisements, and the amount of a business firm's advertising budget are among the matters discussed in other contributions. In view of the growing importance of good advertising in the trade Press as an aid to salesmanship, the publication should be useful to the increasing number of men who are specialising in the subject.

"The Electrical Educator."—We have received copies of the first two parts of the above work, which is being published by Sir Isaac Pitman & Sons, Ltd., in 30 fortnightly parts (at 1s. 3d. each). Part I was issued on October 3rd. The prospectus of the work covers a wide field of electrical engineering ranging from the elementary principles of electricity and magnetism to advanced theory and practice, arranged in lessons so that each part covers many electrical subjects. Many eminent engineers are contributing. Among them are Col. R. E. Crompton, C.B., M.I.E.E., Sir Charles Bright, F.R.S.E., and Professors Miles Walker, D.Sc., and W. Cramp, D.Sc. The opening article in Part I, "The Education of Electrical Engineers," by Professor Walker, is of particular general interest. Another interesting contribution is "Electricity and Magnetism," by Mr. C. H. Yeaman, City Electrical Engineer, Stoke-on-Trent, in which appears an ingeniously arranged chart showing the relations of the various branches of human knowledge. Part II contains another article of general interest, "The Miner and the Super Power Station," by Mr. Frank Hodges, Secretary of the Miners' International Federation.

"The Restoration of Belgian Public Finance," by A. E. Janssen. London: University of London Press, Ltd. Price 1s. net.

"Report of the Committee of the Privy Council for Scientific and Industrial Research for 1924-25."—London: H.M. Stationery Office. Price 3s. net.

"*Proceedings* of the American Society of Civil Engineers."—Vol. LI, No. 8, October, 1925.

"The Technology Reports of the Tohoku Imperial University," Sendai, Japan.—Vol. V, No. 3, 1925.

"The *Journal* of the South African Institution of Engineers."—Vol. XXIV, No. 2, September, 1925. Price, 2s.

"The *Transactions* of the South African Institution of Electrical Engineers."—Vol. XVII, Part 6, August, 1925. Price, 2s.

The Best-lighted Window.—The first prize awarded by the Bradford Electrical Contractors' Association for the best-lighted window in the recent Bradford Shopping Week has been given to Messrs. Rushworth, Ltd., fancy dealers. The lighting specification was prepared by Messrs. Guy & Laycock, Ltd., of Huddersfield.

New French Company.—La Société Pathe Radio is the name of a new company which has been lately formed in Paris (30, Boulevard des Italiens), with a capital of 1,200,000 francs, to manufacture radio apparatus.

Lighting and Power Notes.

Barking.—Electricity in Bulk.—The Urban District Council has decided to cease generating its own electricity supply and to take a bulk supply from the County of London Electric Supply Co., Ltd. The cost of a new sub-station with the necessary equipment is estimated at £24,157.

Barrow. — New Hydro-Electric Station. — The Town Council on October 5th approved the scheme, subject to the necessary agreements being entered into, for a hydro-electric power station on the River Leven, at Backbarrow, and it was decided to make application to the Electricity Commissioners for their approval to the establishment of the proposed station and for sanction to the borrowing of £90,000, made up as follows:—Works at Backbarrow, £78,000; transmission line, £12,000. It was further resolved to recommend that application be made to the Unemployment Grants Committee for a grant towards the cost of the scheme.

Barry.—Special Order.—The Urban District Council has applied for a Special Order authorising it to supply electricity in the district. It is proposed to obtain a supply from the South Wales Electric Power Distribution Co.

Beckenham.—New Electricity Charges.—The Urban District Council proposes to introduce the following revised electricity charges:—Present tariff: An initial charge based on the kW connected, all electricity used being charged at 2d. per kWh. Revised rate: A charge of 12½ per cent. on the rateable value of premises for the first £75, and 6 per cent. on values above £75, plus 2d. per kWh in houses where electricity is not used for cooking, and 1½d. per kWh where cookers are installed. The Electricity Committee has decided to make an inclusive charge of £5 10s. per annum for 500-W lamps used for outside shop lighting.

Bradford.—Electricity Extensions.—The Corporation Estimates Sub-Committee has approved of the Electricity Committee recommendations for the erection of transformer chamber buildings at Norman Lane (Eccleshill) and Harrogate Road (Apperley Bridge), and the provision of new e.h.p. cables from the Valley Road generating station to the Sunbridge Road sub-station, at an estimated cost for cables of £4,300.

Canada.—Hydro-Electrical Development.—According to *Power*, a report recently issued by the Ontario Hydro-Electric Power Commission gives details of three alternative proposals for the improvement of the international stretch of the St. Lawrence River for navigation and for developing electrical energy of 1,600,000 h.p. One project contemplates all the power being developed at the foot of the Long Sault, another the generation of part of the power near Morrisburg, Ontario, and the third is similar to the second, but with the upper power house situated at Crysler Island. The Commission estimates that it will be necessary to provide new sources of electric power amounting to more than 400,000 h.p. by 1931, which would be increased to over 1,100,000 h.p. in 1936, and states that if authority were immediately granted to develop the international portion of the St. Lawrence by 1935 or 1936, the whole of Ontario's share of the St. Lawrence River power would probably be absorbed by the Ontario markets alone.

Cheltenham.—Loan.—The Town Council is applying for sanction to the borrowing of £5,000 for mains and services.

Chesterfield.—Electricity for Small Houses.—Owing to the increased popularity of the "hired wiring" scheme for small houses, the Corporation is applying for sanction to a further loan of £4,548 to cover the cost of the wiring of 621 additional houses.

Extension of Supply.—Mains are to be extended along Holymoorside Road to Greendale Avenue at an estimated cost of £354, and a supply to the whole of the village of Holymoorside is to be considered at the next meeting of the Electricity Committee.

Price Reductions.—The following reductions have been made in the charges for electricity:—Lighting: From 5½d. to 4¾d. per kWh, with a discount of 5 per cent. for prompt payment. Combined rate to large power consumers: The "unit" charge from .4d. to .380d., with discounts varying from 10 per cent. to 22½ per cent.

Colne.—Electricity in Bulk.—The Town Council has received a request for a supply of electricity to Earby, and proposes to give a bulk supply, subject to satisfactory terms being arranged.

Continental.—The Tyrol.—A telegram from Innsbruck states that German financiers are granting a loan to the Tyrol of ten million schillings, which will be used, among other purposes, for the development of water power.—*Reuter* (Vienna).

Switzerland.—The report on the working of the Basle municipal electricity stations during 1924, states that the original plant, which had a capacity of 8,230 kW, is now only used for emergency purposes. The capacity of the Basle generating stations has been increased to 36,000 kW, while during the past ten years the demand for lighting and household purposes was advanced from 2½ to 12.4 million kWh, and for power purposes from 21.8 to 37.6 million kWh per annum.

Austria.—The Stern-Hafferl Gesellschaft, of Gmunden, has recently established a new hydro-electric generating station at Steeg on Lake Hallstatter for the supply of the power required for the operation of the Salzkammergut section of the Austrian State railways. The electrical plant, which was supplied by the Austrian Siemens-Schuckert Co., of Vienna, comprises six alternators, driven by Pelton-type turbines.

Germany.—With the support of the Thuringian Government, a company has recently been formed to utilise the water power of the River Saale between the Bavarian frontier near Hirschberg and its junction with the Lockwitz. It is proposed to construct a dam which will enable the water of the river along a distance of about 18 miles to be utilised, and to establish a hydro-electric station having an annual output of approximately 60 million kWh.

At a recent meeting of the Baden Government authorities, the Finance Minister gave some interesting particulars of the progress of the Baden Provincial Electricity Supply Co., which is now suppplying electricity to 500 small towns and villages. The Murgwerk power station, completed in 1918, has an output of 67 million kWh per year, a total which will be brought up to 123 million kWh by the Schwarzenbach station, which is rapidly approaching completion. In order to provide ample supplies in excessively dry periods, the Baden Co. is establishing a 100,000-V transmission line to obtain electricity from Swiss power stations as far south as the St. Gotthard, and in the north is linking up with the steam generating station of the Rhenish-Westphalian Co.

Doncaster.—Extension of Supply.—The Corporation Electricity Committee has received an application from the Bentley-with-Arksey Urban District Council for a supply of electricity to 94 houses to be built by the latter Council on the Bentley House Farm estate, and has decided to provide a supply. Subject to borrowing powers being secured, the Committee has agreed to lay a new e.h.p. feeder cable to Bentley, at an estimated cost of £3,300.

Edinburgh.—Year's Working.—We have received from Mr. E. Seddon, engineer and manager of the Corporation electricity undertaking, a copy of his report, together with the statement of accounts for the year ended May 15th last. The total income amounted to £460,454, and working expense were £243,286, leaving a gross surplus of £217,168. The figures for the preceding year were: Income, £429,817; working expenses, £220,100; gross profit, £209,717. Interes absorbed £96,992, contribution to liquidation of debt for capita expenditure £106,516, and income tax £7,485, leaving a balanc of £6,175. The previous year's working resulted in a surplu of £17,687. The capital expenditure during the year amounte to £216.346, the bulk of which was spent on machinery an plant for the Portobello station, and for mains and cables. Th sales of electrical energy increased from 52,781,659 to 65,638,59 kWh. During the year the Electricity Committee considere a number of extensions to generating and sub-statio machinery and recommended the following additions:—On 10,000-kW turbo-alternator; two 65,000-lb. boilers; one cir culating and one boiler feed pump; one 500-kW motor con verter for Gorgie sub-station; sub-stations for the supply o a.c. at Davidson's Mains, Murrayfield, Inverleith, and Black hall; extensions to cable system linking up these sub-stations.

Fleetwood.—Hire of Domestic Apparatus.—The Town Council is applying for sanction to borrow £5,000 for the purchase of electric heating and cooking apparatus to be le out on hire.

Hull.—Loans.—The Electricity Committee is applying for sanction to loans of £188,000 for mains and services, and £79,000 for sub-stations.

Irish Free State.—Edenderry (King's Co.).—The Ministry of Industry and Commerce has refused to sanction a scheme proposed for the public and private supply of electricity for the town, stating that facilities for a bulk supply would be available from the Shannon scheme in a few years' time. A local arrangement for public lighting could meanwhile be made.

Liverpool.—Progress of Extensions.—Mr. H. Dickinson, city electrical engineer, states that rapid progress is being made with the extension of the Lister Drive power station, and that the new 25,000-kW set will probably be put into commission early in the new year. The work of erecting two new boilers is well advanced, the new cooling tower is nearing completion, and the switchgear is in position. When the new set is completed, the station will have a capacity of 100,000 kW, and there is accommodation for plant of a further 100,000 kW. Since opening the new electricity showrooms in Whitechapel, 220 electric cookers have been let out on hire, bringing the total number now on hire up to about 1,000.

London. — St. Marylebone. — In connection with the Borough Council's scheme for late shop window lighting, we are informed that Venner time switches will be employed.

Electricity Charges.—The City Corporation is to consider what steps can be taken to obtain cheaper electricity for the City. At a recent meeting of the Corporation it was stated that the rate was 6d. per kWh maximum, with a secondary charge of 4d., as compared with 4d. and 1d. respectively in Stepney, Bethnal Green, and St. Pancras.

Loughborough.—Wiring of Small Houses.—The Town Council is considering an assisted wiring scheme in connection with the new Council houses, under which the cost of installation is estimated at £17 9s. 9d. per house, and the cost of supplying 100 kWh at 15s. 2d. The annual revenue is estimated at £3 10s. from the consumption of 100 kWh at 8¼d., this including 6d. per kWh for electricity, 1d. per kWh for meter rent, and 1½d. per kWh for hire-purchase wiring, the latter charge to cease after the consumption of 12,000 kWh. The consumer is to pay £7 10s. towards the cost of installation and the Corporation the balance.

Ludlow.—Purchase of Undertaking Abandoned.—At a recent meeting of the Town Council a recommendation of the Finance Committee that no further action should be taken with regard to the proposal to acquire the local electricity undertaking was adopted. The sum demanded by the company was £10,000.

Lytham-St. Annes.—New Electricity Charge.—The Electricity Committee has approved the following new domestic electricity tariff:—20 per cent. of the annual rateable value, plus 1d. per kWh for all electricity consumed.

Maidstone.—Loans.—The Town Council has applied for sanction to loans of £7,500 for services and £1,000 for the purchase of apparatus to be let out on hire.

Melksham.—Inquiry.—Sir Frank Marwood held an inquiry, on behalf of the Minister of Transport, at the Town Hall on October 7th into objections raised by Col. Forster and Mr. H. H. Parry to the proposal of the West Wilts. Electric Light and Power Co. to erect poles on their land in connection with the scheme for the supply of electricity to a large area of Wiltshire. Mr. G. Ferris, for Mr. Parry, stated that the erection of poles would reduce the value of his property by 30 per cent., and he maintained that the lines should be laid underground. Mr. Long, for Col. Forster, complained that the payment of 1s. for the erection of each pole was insufficient, and if the poles were erected, a reasonable rate should be paid. He also suggested that the company should lay the lines underground. Mr. White, who represented the company, stated that a supply could not be given to Corsham until the transmission line was carried over Mr. Parry's land, and it was necessary to erect lines across Col. Forster's fields to complete the supply for Holt. The cost of underground lines would be at least three times as much as that for overhead lines, with a corresponding increase in the cost of electricity to consumers. A bulk supply was obtained from Bath Corporation to supply

the district, and the Corporation had installed plant for this purpose at a cost of £12,000. The Ministry will give its decision in due course.

Moreton.—Electricity Supply.—The local Council has decided that in view of the high price per kWh and the heavy increase in the rates which would be imposed by the electricity scheme of the Wirral Rural Council, the latter be requested to cease any further expenditure on the scheme until the Electricity Commissioners have considered the complaint raised by the ratepayers of the district. It was further resolved that the Council should send a deputation to Wallasey to inquire into the supply of electricity to Moreton by that authority.

New Zealand.—Hydro-Electrical Development.—According to the *Electrical Engineer of Australia and New Zealand*, the South Canterbury Power Board has requested the Public Works Department to send officers to confer with members of the Board and of the Tekapo League on the question of the future power supplies of the district. At present the Board is receiving a bulk supply from Lake Coleridge, but it is considered that immediate steps should be taken to develop hydro-electric power from Lake Tekapo in order to supplement the supply. The Public Works Department is preparing a report on the scheme. It is estimated that at a head of 900 ft. the lake would yield 300,000 kW at a 50 per cent. load factor.

The Public Works Department is taking immediate steps towards the development of a large hydro-electric scheme at Lake Waikaremoana. An agreement has been arrived at with the Poverty Bay Power Board which requires a supply of energy, and the Department has undertaken to have an electricity supply available within three years. The immediate installation contemplated involves plant with a capacity of 40,000 h.p., at an estimated cost of £2,600,000. The site is capable of development up to 130,000 h.p. Pending the completion of the hydro-electric plant, the Poverty Bay Power Board intends to take over and operate the steam plant of the Gisborne Borough Council. The bulk supply from Waikaremoana will be obtained by duplicate transmission lines erected by the Public Works Department.

Northern Ireland.—Rathfriland (Co. Down).—The Newry Rural District Council has obtained permission to erect overhead lines from Newry to Rathfriland in connection with the scheme for an electric lighting installation in the latter town.

Armagh.—The Town Council has approved a scheme submitted by Mr. P. A. Spalding, electrical engineer, Dundalk, for an electricity supply for the town.

Oldham.—Loan Sanctioned.—The Corporation has received sanction to the borrowing of £65,000 for mains, transformers and switchgear.

Preston-Blackpool-Lytham-St. Annes.—Bulk Supply.—An agreement has been entered into between the Preston and Blackpool Corporations respecting a bulk supply of electricity to Blackpool from the new Ribble power station. An agreement is also being arranged for a bulk supply from Blackpool to Lytham-St. Annes Corporation.

Southport.—Loan.—The Electricity Committee is applying for sanction to a loan of £3,000 for the purchase of electrical appliances required in connection with the new showroom shortly to be opened at the Glaciarum.

Sunderland.—Progress of Extensions.—The Electricity and Tramway Committees recently inspected the Hylton Road works of the two departments and the extensions which are being carried out at the electricity works. Two 250-lb. Vickers-Spearing boilers are in course of erection, and four Galloway boilers have recently been sold and removed and the space thus cleared will be used to install more high-pressure boilers. Four Babcock & Wilcox water-tube boilers are the only remaining low-pressure boilers and will probably be superseded. Four new water-cooling towers are being installed, also a new 10,000-kW turbo-generator, which will be completed about the end of October. A second 10,000-kW turbo-generator is expected to be ready by next July. The electricity undertaking has 56 sub-stations and 117 miles of mains, and within the next twelve months a further 60 miles of mains will be laid, this work having recently been commenced so that all the streets of the town will be lit by electricity.

Ulverston.—Electricity Charges.—At a recent meeting of the Urban District Council it was stated that the charge for electricity would be 9d. per kWh. The supply is being obtained in bulk from Barrow.

Tramway and Railway Notes.

Accrington.—Fares.—The Corporation is applying to the Ministry of Transport for an extension of the Order authorising it to maintain increased tramway fares, which expires on December 31st.

Argentina.—Railway Electrification.—The Ferrocarril Central Argentino recently requested authorisation from the executive authorities to electrify its line from Retiro (Buenos Aires) to Villa Ballester and Tigre by the way of Coghlan. The length of this line is 25 miles.—*Commerce Reports.*

Continental.—Hungary.—The electrification of the Hungarian railways has been postponed, the question of electrification being closely connected with the utilisation of the lignite reserves in Hungary, since water power cannot be utilised to a sufficient degree. Two plans for supplying the necessary power are being considered. One is based on the lignite mines near Varpalota, and the other on the deposits in the Matra mountains. An American-Hungarian company wishes to erect in the Matra district a large central power station which would make the electrification of the Budapest-Hatvan-Miskolc railway possible, while the construction of a power station at Varpalota would provide electricity for the Budapest-Királyhida line. The plans have been submitted to the Government.—*Reuter's Trade Service* (Budapest).

Switzerland.—Plans are being prepared for the electrification of the railway on the right bank of Lake Zurich. It is expected that the work will be completed by the end of 1926.

Spain.—A new company has recently been formed in Burgos to construct a system of electric tramways in the town and district.

Birmingham.—Unemployment Relief Scheme.—With a view to providing work for the unemployed during the coming winter, a sub-committee has recommended to the City Council that the tramway track in parts of the town be renewed, at an estimated cost of £110,000.

Chesterfield.—Railless-Car Scheme Rejected.—The Town Council has rejected a resolution to apply for an Order to run railless cars along certain new routes. The Council already possess Parliamentary powers to substitute railless cars for the present railed system.

Grimsby.—Railless Cars.—In connection with the tramway undertaking recently acquired by the Town Council, the rails at present in Freeman Street are to be removed and the street reconstructed at a cost of £31,670, and a railless-car service introduced on the route, at an estimated cost of £13,000.

London.—L.C.C. Tramway Extension.—Work has commenced on the lengthening of the tramway track at the London County Council boundary at Norbury so as to join up the track of the L.C.C. tramway and Croydon Corporation tramway, thus affording facilities for a through journey from Victoria Embankment to Purley, a distance of 13¼ miles. A through service of L.C.C. cars will be instituted during this month.

Kennington Tube Progress.—A contract has been placed for the construction of crossovers and sidings at Kennington underground station, and work is to commence immediately. This station is to be linked up with Charing Cross, and 1¼ miles of tunnelling have already been excavated. It is anticipated that the tunnelling will be completed by next spring. When the scheme is completed, in addition to the present route to the City, there will be a train service to Edgware, Golder's Green, and Highgate, and eventually to Morden.

Manchester.—Track Renewals.—The City Council has decided to renew certain sections of its tramway track, at an estimated cost of £75,000.

Manchuria.—Harbin.—According to the *Electric Railway and Tramway Journal*, a company has been organised in Harbin for the construction of a tramway in the city, at an estimated cost of $2,730,000.

United States.—Railway Electrification.—According to the *Electric Railway Journal*, the electrical operation of the Virginian Railway was commenced on September 21st. The time previously required by steam trains was 2½ hours from Elmore to Clark's Gap, while the electric trains cover the distance in one hour. The system is operated on the single-phase, 1,000-V system. Power is supplied from a 67,500-kW steam plant at Narrows on the New River. At present it is planned to operate electrically between Mullens, W. Va., and Princetown, Va. Plans have been prepared for extending the electrified section eastward to Roanoke, a distance of approximately 134 miles at a cost of $15,000,000. Electrical operation is expected to double the capacity of the line.

Telegraph and Telephone Notes.

Australia.—Telegraph and Telephone Services.—The financial results for the year ended June 30th, 1924, according to the *Electrical Engineer of Australia and New Zealand*, show that in the telegraph branch a total net loss of £188,982 was recorded, while the telephone branch made a profit of £50,677. The profit on the working of telephone exchanges was £90,257, that on the working of the Sydney-Melbourne trunk line, £15,093; that on the Adelaide-Melbourne trunk line, £6,657; and that on the Sydney-Brisbane trunk line, £4,197. On the other trunk lines a net loss of £80,489 was incurred. On non-exchange lines a total profit of £14,952 was made. During the year a commencement was made with the reconstruction of the Sydney-Melbourne telegraph line and the installation of the carrier wave system; preparations were made for installing telephone repeaters between Sydney and Melbourne; the Teletype system of printed telegraphy was introduced on the Melbourne-Bendigo circuit. Several automatic telephone exchanges were installed in the metropolitan areas, and on June 30th, 1924, 32 per cent. of the city subscribers were receiving automatic service.

New Wireless Station.—A wireless station has been opened at Wave Hill, Central Australia, about five hundred miles from Port Darwin.—*Reuter* (Melbourne).

The *Daily Telegraph* points out that this is the first step in the establishment of an inland system in remote parts of the Continent. Another station is at Camooweal, which connects the landline with the air mail. The Commonwealth operates stations which serve large areas in North Australia, and are a great boon to cattle stations and settlers generally. Previously the mail was delivered every six weeks. The cost of the two stations is £10,000, as compared with £60,000 land-line charges at 2d. per word, with a minimum of 2s. 8d. The private wireless plant at Burnett Downs, a station 171 miles from Camooweal, has proved of great value. The new stations will probably result in a network of private installations, and possibly additional Government stations.

Belgium.—New Cables.—The Belgian Post and Telegraph authorities are shortly to commence the laying of new telephone and telegraph cables between La Panne and Herbesthal, between Brussels and Lille, and between Brussels and Rosendaal.

Brazil.—New Radio Station.—A new high-power naval radio station has been opened on the Ilha do Governador, in the Bay of Rio de Janeiro. It is equipped with Telefunken apparatus and has a normal estimated range of 4,500 miles. Communication is established with naval radio stations in the United States, on the Continent of Europe, and at Panama and Puerto Rico. In addition to regular Government work, the station broadcasts weather reports and time signals.—*Reuter's Trade Service* (Rio de Janeiro).

China.—Japanese Radio Proposal.—In the hope that the interested powers will reach a tentative agreement regarding Chinese wireless questions before the opening of the Tariff Conference, Mr. Matsudaira, the Japanese Ambassador at Washington, has been instructed to enter into conversations with Mr. Kellog, the United States Secretary of State, immediately, lest propagandists should use Japanese-American differences to influence the Conference. Japan proposes that China should control and operate omni-wireless stations, guaranteeing the interested powers property rights. It is understood that China's note regarding wireless has not yet been answered, but Mr. Yoshisawa, the Japanese Minister at Peking, has been instructed to communicate with China unofficially with reference to the proposal, and also to advise her that Japan does not approve of a loan for the purchase of wireless rights. Following the conversations at Washington, the Japanese Ambassadors in London and Paris will be instructed to take up the question. Though China will probably not yet be able to carry out the proposal, Japan thinks that a temporary arrangement will be possible whereby the powers will operate until China is ready.—*Reuter* (Tokio).

Sir Charles Eliot, the British Ambassador, and Baron Shidehara, the Japanese Minister for Foreign Affairs, had a conversation on October 12th, which is stated to have been of a very satisfactory nature with regard to the Chinese wireless question. It is also understood that the Japanese Government is emphasising the importance of the powers being united on their Chinese policy, and that it has instructed the Japanese Charge d'Affaires in London to seek Mr. Austen Chamberlain's co-operation to persuade America that a practical settlement of the wireless question is more important than the insistence on legal rights, which rights Japan is prepared to forgo if others will do the same.—*Reuter* (Tokio).

Italy.—Automatic Telephony.—The last of the Government-owned telephone systems has been transferred to private hands, the purchasers being the Società Esercizo Telefoni, of Naples. It is understood that the company, while making no immediate change of installation, intends to construct suitable premises of its own and to replace gradually the present equipment by automatic switchboards and other modern apparatus. —*Reuter's Trade Service* (Milan).

Italy-Argentina Cable.—Inauguration.—The new direct Italy-Argentina telegraph cable was officially opened for traffic on October 12th at Auzio.

Paraguay.—New Radio Station.—The Government of Paraguay has decided to erect a radio station at Fuerte Olimpo. The Minister of War and Marine, Asuncion, will receive tenders for the supply of materials and tools, the cost of which must not exceed 60,000 Paraguayan paper pesos.—*Reuter's Trade Service* (Asuncion).

The Telephone Service.—New Subscribers.—European telephone returns for the past year, issued by the Post Office, show that the "telephone push" in Great Britain is now having good results. During the period reviewed, the increase in the number of telephones in this country equalled 10 per cent., as compared with Germany's increase of 6 per cent. Germany, however, with 2,385,177 telephones (or one to every 28 inhabitants), still shows a greater "telephone density" than Great Britain, which has 1,264,024 (or one to 34). Sweden has 418,303 (or one to 14), and Denmark 303,754 (or one to 10). America, it may be noted for comparison, had 16,159,550 telephones (an average of one to six), and Canada 1,083,964 (or one to eight). During the year Germany added 142,845 telephones, Great Britain 115,929, Belgium 22,139 (18 per cent. increase), and Denmark and Sweden more than 15,000 each (5½ and 4 per cent. increases respectively). It is estimated that when all the returns are in, the total increase for Europe will be more than 460,000 telephones.

Telegraph Conference.—Possible Rate Increase.—Senatore G. Marconi presided at the dinner given by the foreign wireless companies on the occasion of the eleventh International Telegraph Conference at Paris. *The Times* expects that the Conference will decide to increase the terminal and transit charges for all telegrams. It is understood that the increase will vary from 10 to 30 per cent., the countries belonging to the Telegraph Union being divided into a number of categories, entitling them to a greater or lesser increase according to their financial necessities. The British have steadily opposed any increase, and they have the moral support of the American observers, but they were overruled by the majority of the other countries which emphasised the necessity of an offset to the increased working costs. The increase will apply to Press as well as to ordinary and urgent rate messages.

United States.—Cab Proprietors' Telephone Exchange.—The Telephone Development Association has called the attention of British taxicab proprietors to the fact that the Yellow Cab Co., of Newark, New Jersey, has established a private telephone exchange in which more than twenty girls are employed answering free calls for cabs and trade inquiries. The company has also erected kiosks in various parts of the city from which anyone can order a taxicab without payment of a call fee. Telephone wires from all the cab stations of the company terminate on a private switchboard, which, when operated in conjunction with the public system, gives the company most complete arrangements for dealing efficiently with taxicab business. The principle is much the same as that which is proving so successful at Stockholm.

Venezuela.—Telegraph Service.—According to a report recently issued by the Government Telephone and Telegraph Department, there are now 240 telegraph stations in Venezuela.

Radio Notes.

Latvia.—New Stations.—The Latvian Government's monopoly on the sale of radio apparatus will be discontinued when the new broadcasting stations are opened; they were due to commence service on October 1st.

New Zealand.—Proposed New Stations.—Four new stations are to be erected in New Zealand, says the *Morning Post*, which explains that the promoters of a private company have entered into an agreement with the Government to erect four stations at Auckland, Wellington, Christchurch, and Dunedin, and to maintain an efficient service. It has been agreed that the company shall receive 25s. of the 30s. that the licences will cost.

Proposed New Station.—"5 G.B."—It is understood that the station calling itself 5 G.B., which has recently been heard by listeners, is an experimental station of the British Broadcasting Co. at Chelmsford, using 10 kilowatts and a wavelength of 400-420 metres. The tests are preliminary to any other station that may be erected to serve Essex and S.E. England, at present outside crystal range of any station.

Simultaneous Broadcasting.—Land Line Reorganisation. —The reorganisation of the land-line system for the simultaneous broadcast service will be brought into operation on November 1st, when Leeds will become the pivot controlling all the transmissions relayed between the South and the North, says *The Times*. Hitherto, land-line connections between one broadcast station and another have been operated through London, except for a small intercommunication switchboard at Glasgow for linking all Scottish stations. Separate lines have been used between London and practically all other stations, save in one or two cases, and the quality of transmission has suffered by the use of several hundreds of miles of unnecessary land-lines. From November all stations north of Leeds will be linked up by land-lines to Leeds instead of to London. Between London and Leeds four special lines have been set apart by the Post Office for the use of the B.B.C. Generally, only one will be wanted, but spares are provided for alternative programmes, control purposes, and emergency use. The arrangements at Leeds will be much more automatic than they have been from London. The chief function of Leeds as a pivotal point will be to improve the quality of all items it receives from London before they are passed on. In the near future another pivot will be installed to facilitate simultaneous broadcast arrangements between London and the West Country.

South Africa.—Johannesburg.—The Johannesburg Broadcasting Co.'s station, which works on almost the same wavelength as the London station and on a power of from 1½ to 2 kW, now has about 8,000 licence holders. A licence costs £2 5s., and the station has been in operation a little over a year. The company makes no profit, but functions for the Government.

Wave-length Agreement.—Ships' Interference.—*Reuter* is officially informed that the agreement between the British, Canadian, and United States Governments to prevent the use by ships of wavelengths of 300 and 450 metres when within 250 miles of the coast applies only to the coasts of Canada, Newfoundland, and the United States. There is no such prohibition in the case of ships when within 250 miles of the coasts of the British Isles.

Richard Alexander Chattock.

President of the Institution of Electrical Engineers.

As we mentioned in our issue of June 5th, Mr. R. A. Chattock, city electrical engineer to the Birmingham Corporation, who took up his duties on October 1st as President of the Institution of Electrical Engineers, is the first head of a municipal electricity supply undertaking to occupy that distinguished post. That he will confer additional distinction upon the presidential office cannot be doubted, in view of the honourable position which he has attained in the profession during his 25 years' public service as city electrical engineer, of which all but three years has been spent at Birmingham.

Mr. Chattock was born at Solihull, Birmingham, in 1865, and was educated at University College School, London, whence in 1881 he passed to University College, London, for his technical training, winning the Gilchrist Engineering Scholarship. From 1886 to 1889 he served as pupil in the ironworks of Messrs. John Stewart and Son at Blackwall, London, after which he joined the staff of the Metropolitan Electric Supply Co., Ltd., as junior engineer, in due course becoming engineer in charge of the company's generating station at Amberley Road, Paddington. In 1894 he was appointed chief electrical engineer to the Vestry of St. John, Hampstead, but a year later he assumed charge of the large generating station of the City of London Electric Lighting Co., Ltd., at Bankside. Entering municipal employ in 1900, as city electrical engineer to the Bradford Corporation, Mr. Chattock was appointed to his present post in 1903.

Photo by] **Mr. R. A. Chattock, President I.E.E.** *[Lafayette, Manchester.*

Under his control the Birmingham electricity supply business has undergone an enormous development. The capital expenditure has increased from £588,000 to over £5,700,000, and the output of electrical energy from 3¾ million kWh per annum to 193 million kWh, whilst the revenue has grown from £67,000 to £1,200,000. It is interesting to note that in round numbers the original capital has been multiplied by 10, the revenue by 20, and the output by 50, showing what a vast change in the conditions has been wrought in 22 years. Considerable contributions have been made to the borough rate fund, and at the same time large reserve funds have been built up.

Mr. Chattock was responsible for the design and erection of the Summer Lane power station of 30,000 kW capacity, which was opened in 1906 and was a very notable example of d.c. generation on a large scale. When war broke out, heavy demands for electric power for the production of munitions of war, for which Birmingham was an important centre, rendered it necessary to build and equip a temporary generating station of 10,000 kW capacity, which was satisfactorily accomplished in 1915 in the short time of nine months; in the following year the plant was increased to 22,000 kW capacity, but still the demand grew, and in 1918 the Ministry of Munitions authorised the department to construct the Nechells power station, for the design and erection of which also Mr. Chattock has been responsible. The new station was opened by the Prince of Wales on June 12th, 1923, and is now called Prince's Station, Nechells; it contains three-phase generating plant of 75,000 kW capacity, and contracts have been placed for completing it to its full equipment of 105,000 kW. An illustrated description of the station was given in our issues of May 25th and June 1st, 1923.

Owing to the continued increase in the demand for electricity, Mr. Chattock is now engaged on the plans for another capital station; a site of 1,000 acres has already been purchased, with ample facilities for obtaining coal and water in quantities sufficient to meet all future requirements. He has consistently adhered to the policy of supplying direct current at the consumers' terminals, and for this purpose has adopted the mercury-arc rectifier on an exceptionally large scale, no fewer than 30 small automatic rectifier substations having been installed in the outlying parts of the city during the past three years. Similar apparatus has also been utilised for boosting the pressure on outlying sections of the network, thus avoiding a large outlay on long and heavy d.c. feeders. Recently Mr. Chattock has interested himself in the use of pulverised fuel, and after full investigation he has equipped six of the boilers at the Prince's Station with plant for this purpose, with a view to increased economy.

During the war, busy as he was, Mr. Chattock found time to take part in the formation and equipment of the Corps of Birmingham Electrical Engineer Volunteers, of which he was the honorary colonel. Some hundreds of electrical recruits were trained in this force, and were drafted into the Navy and the Army.

He has also been an active member of the leading electrical engineering institutions, and has been President of the Incorporated Municipal Electrical Association, Vice-president of the Institution of Electrical Engineers, and President of the Birmingham Association of Mechanical Engineers. For the past 34 years Mr. Chattock's working hours have been entirely devoted to the development of the electricity supply industry, and no better testimony to the ability and enterprise by which he is characterised could be found than the efficiency and the enormous expansion of the huge electrical undertaking under his control.

E

Electricity Supply at Halifax.

Recent Extensions at the Generating Station.

Since the installation in October, 1923, at the Halifax Foundry Street electricity works of a 10,000-kW turbo-alternator (Electrical Review, November 2nd, 1923), the rapid growth in the output demanded from the station has resulted in the recent extensions to the plant, which were inaugurated on September 3rd last, the opening ceremony being reported in our issue of September 11th. The extensions consist of a second 10,000-kW turbo-alternator, fig. 1, similar to the one referred to above, and the necessary auxiliary plant and switchgear. The turbo-alternator is of the British Thomson-Houston Co.'s manufacture and generates at 6,600 V, 50 cycles, running at 3,000 r.p.m. It will be recalled that the first set had the distinction at the time of its being installed of being the first of its capacity to run at such a high speed. The turbine is of the Curtis compound impulse type, with nine stages, the first stage having two rows of blades, and the remaining eight stages one row each. Steam is admitted at a gauge pressure of 160 lb. per sq. in. and at 180 deg. F. superheat, and exhausts into a 28-in. vacuum. The blades are made of phosphor bronze and the shaft is designed for a critical speed at 1,000 r.p.m.

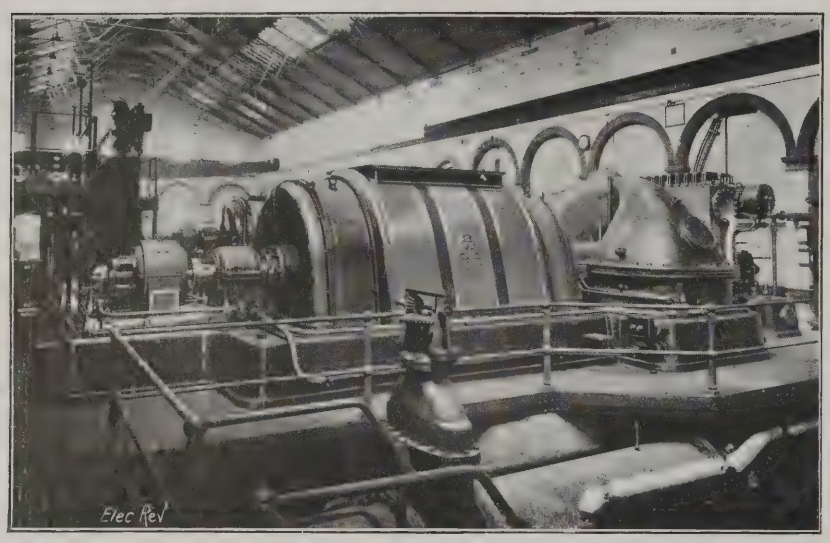

Fig. 1.—New 10,000-kW Turbo-Alternator.

The alternator is totally enclosed, air-cooled, and self-ventilating. In order to facilitate the running of the machine through the critical speed, the alternator outboard bearing is flexible to permit of small play between friction collars, and the radial movement thus allowed, with the resulting work done on the friction collars, completely destroys any tendency of the shaft to whip. A collector ring of steel, fitted with eight brushes, is mounted at each end of the rotor.

The condensing installation was built by Messrs. Worthington-Simpson, Ltd., to the specification prepared by the electrical engineer and manager, Mr. W. M. Rogerson, M.I.E.E. The turbine under full-load conditions exhausts steam at the rate of 125,000 lb. per hour, and the condenser maintains a vacuum equal to 1 lb. absolute pressure by means of specially-designed air extraction pumps. Its 7,300 tubes represent a cooling surface of 23,000 sq. ft.

The centrifugal circulating pump delivers 17,500 gallons of water per minute. The driving motor is of 300 b.h.p. The circulating-water system is interconnected with the other 10,000-kW set and a 6,000-kW set, with the necessary cut-out valves. The steam discharged from the ejectors is condensed in tubular coolers through which the condensed steam from the main condensers is delivered, and all the latent heat from the steam is imparted to the condensate and returned to the boilers.

The switchgear installed in this station was supplied by the British Thomson-Houston Co., Ltd., and is arranged in two distinct banks. The first bank, comprising the generator switches, is connected by two group feeders to the second bank, which contains the switchgear controlling converters and local feeders. By this arrangement local faults of small magnitude are cleared by the circuit breakers of smaller capacity on the feeder bank without disturbing the generator bank. Both banks have duplicate sets of bus-bars, and the h.p. switchgear is of the cellular type. Circulating current protection is provided for the generators, and is used in conjunction with field-suppression equipment. In addition, stand-by overload relays are provided.

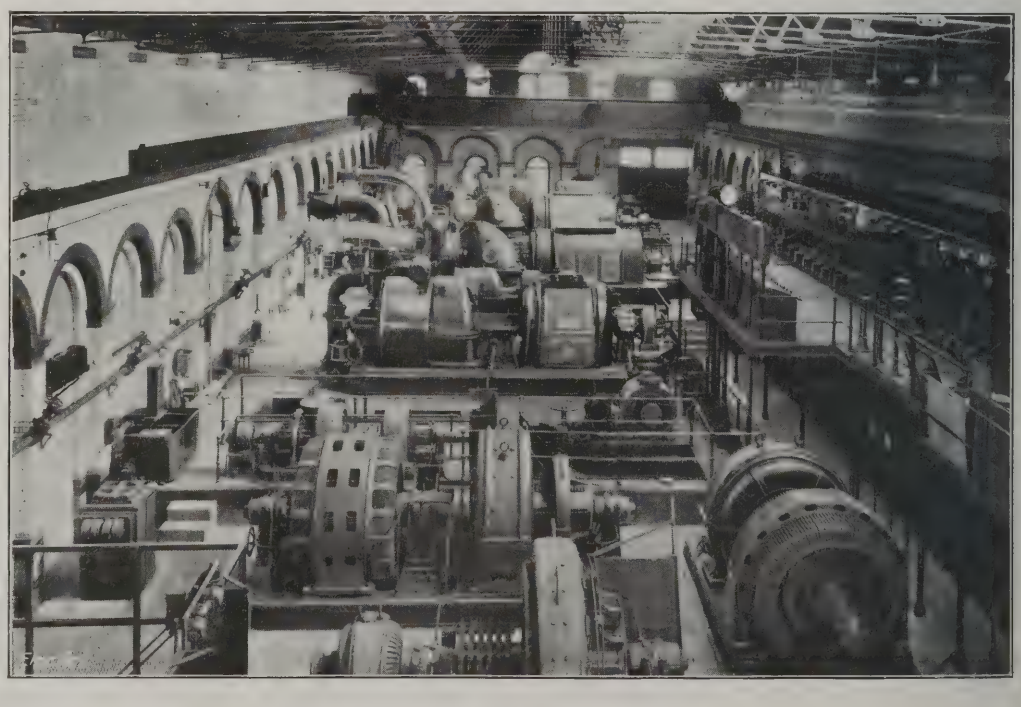

Fig. 2.—Turbo-generator Room at Halifax.

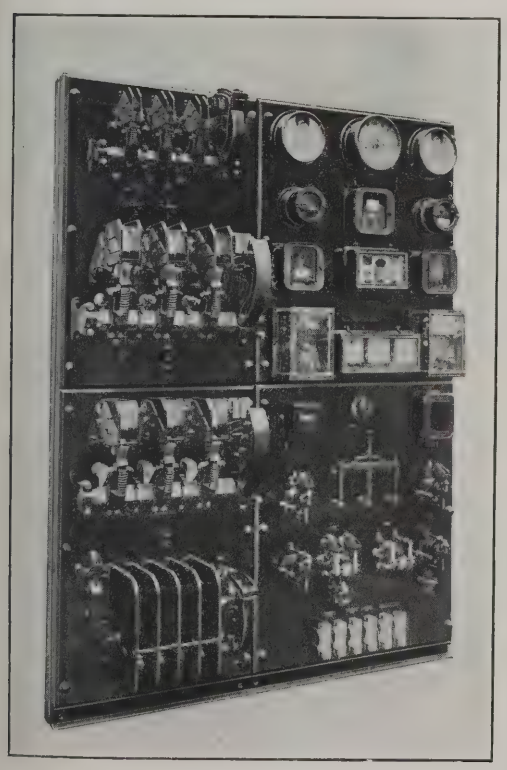
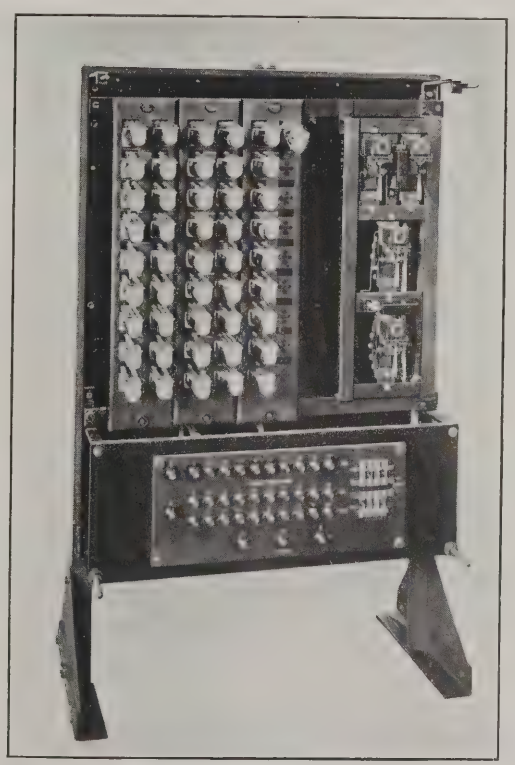
Extensions now being installed comprise two 8,000-kVA feeder circuits on the generator bank for supplying the new sub-station at Highroad Well; they will control the full exchange of power with Huddersfield. The total capacity of the station is now 31,000 kW.

The Supervisory Control of Sub-Stations.

Metropolitan-Vickers Automatic Plant for New Zealand.



Last week's convincing demonstration of the supervisory control of one of the sets of automatic sub-station equipment which the Metropolitan-Vickers Electrical Co., Ltd., is supplying for the City of Wellington, New Zealand, electricity undertaking is of interest for several reasons. It is the first example of control gear of its kind to be manufactured in this country, and consists of the application of automatic telephone apparatus to the remote control of electrical plant and switchgear. Only three single telephone wires are necessary between the control room and the distant plant, however great the distance, and however many the operations to be performed. Telephone communication can be carried on over the same wires.



Each of the three sub-stations contains a 750-kW. tap-started rotary converting to 550 volts d.c. When in a residential district, the buildings are constructed sound-proof. Initially there was some doubt about which method of controlling the stations would best suit the local conditions. Accordingly alternative methods were provided for the Newtown traction station (first in commission in the late spring of 1924) either of which can be selected as desired:—Fully automatic, load demand; remote control by two pilot wires; and time switch, in addition to emergency manual control, subsequent operations being entirely automatic. Whichever method of initiative control is used, the starting operations are the same:—(i) The energising of the master contactor completes the control circuit from an auxiliary transformer; (ii) the brushes on the machine are raised, the starting contactor and main oil circuit breaker are closed; (iii) should the machine build up with wrong polarity, a field contactor controlled by a polarised relay corrects it; and (iv) the starting contactor is then opened and the running contactor closed, putting the machine on to full voltage; (v) when the brushes are lowered and the field has been built up, the machine is connected to the d.c. bus-bars through steps of limiting resistances, which are then cut out by shunting contactors if excessive current is not passing.

The protective features provide against the following contingencies:—(*a*) Faulty a.c. supply (low voltage, open or reverse phase); (*b*) excessive a.c. overloads; (*c*) faults (external or *internal to the sub-station) causing unbalanced currents; (*d*) overheated machine and transformer windings due to repeated overloads; (*e*) wrong polarity; (*f*) field failure; (*g*) *overspeed; (*h*) d.c. overloads; (*i*) d.c. reversals; (*j*) overheated limiting resistors; (*k*) *hot bearings; (*l*) *incomplete sequence of starting operations; and (*m*) *earths on machine (flash-overs) on later sets only. In the event of troubles marked * a lock-out relay will shut down the equipment and will prevent it re-starting until hand reset. If the shut-down is due to hot windings or resistors the set will be re-started when sufficiently cool, while the traction feeders are only tripped by the occurrence of faults and not by legitimate overloads, and are automatically restored to service when of a suitable resistance, thereby maintaining the service up to the utmost limit with safety.

Fig. 1.—Supervisory Control Office Desk.

Figs. 2 & 3.—Low-pressure Contactor Panels and Relay Rack in Sub-station.

The Thornton and Karori stations differ from the above-mentioned plant chiefly in that the h.p. gear is of the M.-V. armour-clad type with a.c. motor-operated closing mechanisms on "K.I." oil circuit breakers of 150,000 kVA capacity. The closing mechanism is noiseless in operation, and permits of the use of a small control transformer of approximately 0.5 kVA capacity;

the latter, together with a 3-phase potential transformer, is contained in one tank with h.p. fuses and limiting resistances, and can be withdrawn on wheels without interfering in any way with the remainder of the gear, the live receptacles being automatically shuttered when the tank is pulled forward. Shunt-wound machines with one step of limiting resistances are used instead of level-compounded machines with three steps.

The Karori station is provided with all the methods of control fitted at Newtown, but its a.c. oil circuit breaker and d.c. main and feeder contactors have auxiliary switches so as to permit supervisory control to be added later.

In the case of the Thornton sub-station the supervisory gear has been made by the Automatic Telephone Manufacturing Co., of Liverpool, its arrangement being a joint design. The relays used are identical with those embodied in the automatic telephone exchanges in successful operation in many parts of the world and with those being made for the new G.P.O. London exchanges in course of construction.

The control room equipment comprises a desk with keys for selecting and controlling the desired devices in the sub-station, and indicating lamps to show their condition, together with rotary stepper switches and relays for the transmission and receipt of signals to and from the sub-station. The relays and switches with protective fuses are housed on the left-hand side of the desk (fig. 1). On the sloping top of the desk are the double-way selective keys, each with its four associated lamps, suitably labelled with the names of the devices they control. Each group of lamps consists of two white, one red, and one green. Selective keys are provided (*a*) to start and to shut down the rotary converter, the associated indicators being red for machine a.c. oil circuit breaker closed, and green for the open position. (*b*) To close or open the main d.c. contactor and resistance shunting high-speed circuit breaker. (Provision is made in the sub-station so that, if desired, these contactors will operate automatically, the signals still being sent back.) The associated red and green lamps show whether the main contactor is closed or open. (*c*) To close or open any of the outgoing traction feeders, one key for each feeder with its associated red and green lamps showing whether the corresponding contactor is closed or open. Lamps are provided to indicate if the machine is locked out. Separate from the selective keys is a distinctive operating key, and the purpose of the repeat signal key is to check the indications of the position of all devices indicated, while another stops the bell ringing, which alarm warns the operator at the control office when any device in the sub-station changes its position. A 48-V d.c. supply is necessary for energising the apparatus and indicators.

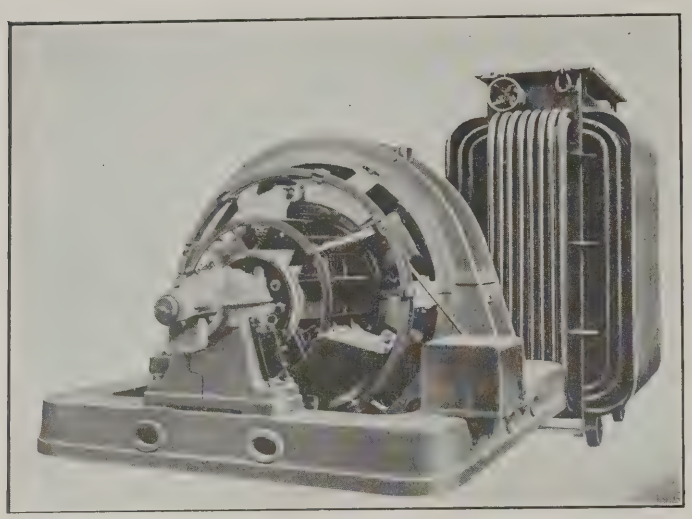


Fig. 4.—825-kVA Transformer and 750-kW Rotary used in Demonstration.

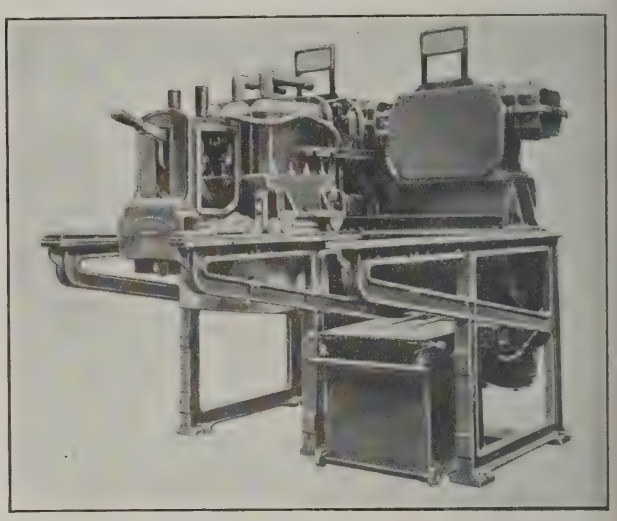

Fig. 6.—High-pressure Switch and Motor-operated Circuit-Breaker, A.C.

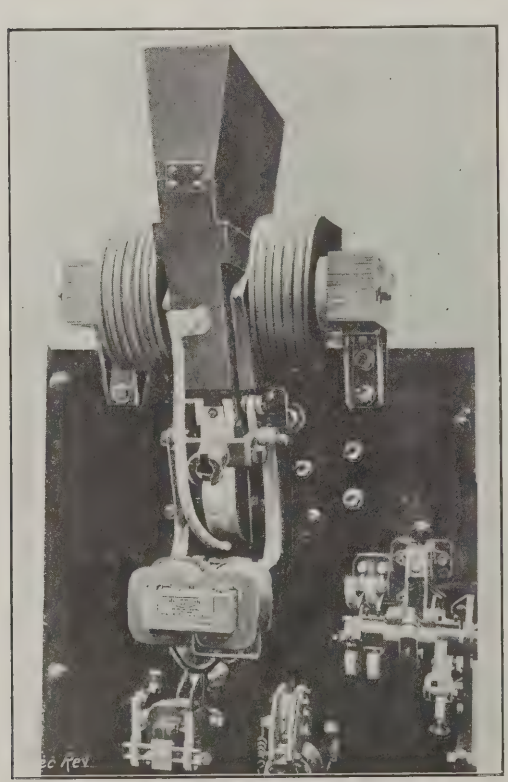

Fig. 5.—High-speed Circuit Breaker, D.C.

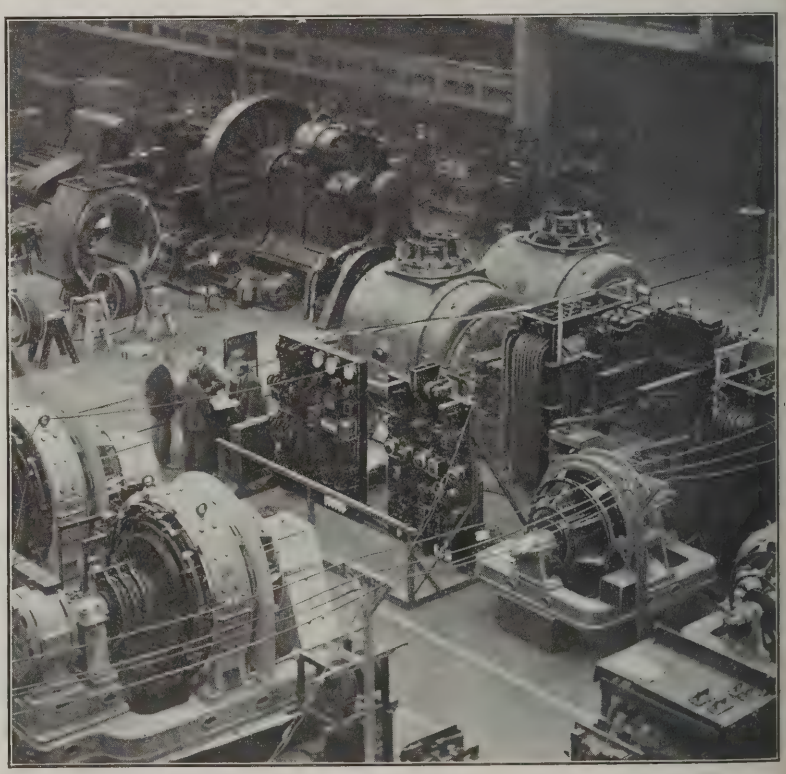

Fig. 7.—Equipment on Test at Trafford Park.

In the sub-station a cabinet contains the necessary relays and stepper switches for receiving signals to select the device to be operated and similar apparatus for the transmission of signals to the control office, whereby the indicating lamps show the position of each device. A Tungar rectifier controlled by a time switch automatically recharges the battery, and there are also interposing relays for linking together the supervisory relays and the devices controlled. Two such relays are required per circuit breaker, one to make the closing-coil circuit and the other the tripping circuit. Each circuit breaker to be indicated is fitted with the necessary auxiliary switches for operating the signal relays.

For convenience of explanation assume the sub-station is shut down; the green lamp corresponding to the "start" selective key will be glowing, indicating the main oil circuit breaker is in the open position. The operator at the control office pushes the "start" key downwards (movement in the upward direction would "close down" if the machine was running). This energises a relay which prevents any other operation signal being sent simultaneously, and also energises a rotary stepper switch having wipers which sends out 25 impulses to the sub-station. The polarity of these impulses is reversed when the stepper switch passes over a contact connected to the particular selective key.

At the sub-station a relay picks up the impulses and starts off two rotary stepper switches (A and B) each with three wipers. When the reversed impulse is received one stepper switch (B) stops, one (A) continues to rotate, and a third stepper switch (C), also with three wipers, starts off. At the end of the 25 impulses these come to a standstill, (A) being then on its 25th contact. One set of contacts on (B) and (C) are connected oppositely together, so that, if conditions are correct, the difference between the impulses taken by (B) and (C) complete a circuit, whereby the sub-station battery sends a current along the pilot wires to operate a relay at the control office to cause the white lamp, corresponding to the selective key which was operated, to glow and show that the device to be operated has been correctly selected. The time taken is about three seconds from moving the selective key to receiving the white lamp signal.

The operating pilot wire is also now suitably connected so that the operator, by depressing the special operating key, completes a circuit energising a pilot relay which, by means of an interposing relay, immediately energises the master contactor of the automatic equipment. The usual sequence of starting operations will now take place, and the supervisory relays will reset themselves to normal when the selective key is returned to its normal position.

When the oil circuit breaker of the machine closes, an auxiliary switch completes the circuit of a relay forming part of the supervisory equipment, which brings into action a stepper switch (D), having four wipers, and also causes the pilot wires to be changed from the impulse-receiving to the impulse-transmitting apparatus. Alternative contacts of one of the wipers is associated with an auxiliary switch on each circuit breaker to be indicated. Impulses of different polarity are sent by the switch (D) to the receiving relays at the control office. The first impulse sent is positive, but the following ones are negative except when the wiper crosses a contact associated with a closed circuit breaker, in which case the impulse is positive.

At the control office three relays are provided, one of which responds to all signal impulses received, another to positive, and one to negative impulses only. When the first (positive) impulse is received at the control office the pilot wires are disconnected from the impulse-sending and connected to the impulse-receiving relays. The relay responding to all impulses causes a rotary stepper switch (E) with three wipers to step in unison with the impulse sender switch (D). Should a positive impulse be received when one of the wipers of (E) is on contact, a relay causes the red lamp to show that its corresponding circuit breaker in the sub-station is closed. Similarly, negative impulses result in the corresponding green lamps being illuminated, showing circuit breakers in the open position.

(To be concluded.)

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—Sydney.—November 30th. Public Works Department. Metering equipment for the Barren Jack hydro-electric development scheme and the Kiama-Nowra transmission line.*

Melbourne.—December 1st. Postmaster-General's Department. Motor-generator sets for charging secondary batteries. (October 2nd.)

December 14th. Electricity Commission of Victoria. 22,000-V insulators. (See this issue.)

Sydney.—December 16th. New South Wales Government Railways and Tramways. 10 single-phase, 1,800-kVA transformers.*

Belfast. — November 2nd. Electricity Department. Motor-generator and transformer. (October 9th.)

Belgium.—Municipal authorities of Ghent. Four or eight electric cranes for the northern quay of the Central Dock. Particulars (Cahier des Charges No. 1,573) from Hotel de Ville.

November 4th. Société Nationale des Chemins de Fer Vicinaux, 14, Rue de la Science, Brussels. Overhead equipment in connection with the electrification of the Binche-Leval-Trahegnies local railway. Particulars for 5 fr. from Bureaux des Services Electriques, 48, Rue Montoyer, Brussels.

Bristol.—October 19th. Port of Bristol Authority. Two 2-ton electric capstans. Specification from the General Manager and Secretary, 19, Queen Square, Bristol.

Dartford.—October 17th. Electricity Works. Small steam coal for 6 or 12 months. (October 9th.)

Dublin.—Electricity Department. Transformers for one year. City Electrical Engineer, Fleet Street, Dublin.

Dublin Borough Commissioners. Electric wiring of 416 houses at Croydon Park. City Architect, Exchange Buildings, Lord Edward Street, Dublin.

Egypt.—Cairo.—December 1st. Ministry of Public Works. Two pumping units and accessories for the Mex pumping station.*

Glasgow.—October 19th. Parish Council and District Board of Control. Stores, including electrical fittings, for six months. Forms of tender from Mr. M. A. Reynard, inspector and clerk, 266, George Street.

Kilmarnock.—Electric lighting work in connection with the Corporation Riccarton housing scheme. Particulars from Mr. Wm. Dunbar, burgh surveyor.

Leeds.—October 20th. Tramway Department. 150 double-deck top-covered tramcars complete, or, alternatively, 150 tramcar bodies, 190 tramcar trucks, including wheels and axles, 190 tramcar electrical equipments. (October 2nd.)

London.—H.M. Office of Works.—November 3rd. Installation of cables, switchboards, &c., and wiring at the Ministry of Pensions Hospital, Orpington. (See this issue.)

November 4th. Electric wiring in conduit at Montagu House. (See this issue.)

Metropolitan Asylums Board. November 4th. Installation of two new hydro extractors at the Western Fever Hospital, Seagrave Road, S.W.; installation of hot-water heating apparatus at St. Anne's Home, Herne Bay; and installation of automatic telephones at the Downs Hospital for Children, Sutton, Surrey. (See this issue.)

Paddington.—November 3rd. Great Western Railway. Telegraph instruments, electrical apparatus, &c., telegraph ironwork and tools, telegraph drysalterers. November 20th. Electrical wires and cables. (See this issue.)

Manchester. — November 6th. Electricity Committee. One 500-kW fully automatic, motor or rotary converter, transformers and switchgear, &c. Three 500-kW fully automatic, motor or rotary converters or mercury-vapour rectifiers, transformers, switchgear, &c. (See this issue.)

Newport (Mon.).—October 28th. Electricity Department. Electrically-driven pumps, pipework, valves, &c.; switchgear; water-screening plant. (October 2nd.)

New Zealand.—Hastings.—February 1st. Borough Council. Diesel engine and a.c. generator.*

Sheffield.—October 20th. Tramways and Motor Department. 50 double-deck vestibule tramcars. (October 9th.)

Sleaford. — October 20th. Electricity Department. Cables, &c. (October 9th.)

Southampton.—November 2nd. Harbour Board. Alterations to the electrical equipment of 12 cranes, supply of cables, disconnecting boxes, switchgear. Specifications from Mr. W. G. Gubbins, clerk, Harbour Offices.

Southend-on-Sea.—Light Railways and Electricity Department. House-service meters and demand indicators. (October 2nd.)

Uruguay. — Montevideo.—December 22nd. State Electricity Supply Works. 200,000 metres r.i. wires and cables.
December 28th. 1,060,000 metres of special cable for outside use.
November 27th. H. and l.p. cables and accessories.*
January 7th. 26,000 kilograms of copper wires and cables.*
January 8th. Black and G.I. wire, &c.*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—Sydney.—Electricity Supply Committee. Recommended:—
Gasfilled lamps (£4,594).—Australian General Electric Co., Ltd.
H.p. and l.p. cables.—Siemens Bros. & Co., Ltd. (£91,718); Enfield Cable Works (Aust.), Ltd. (£35,445).
Overload relays (£1,558), leakage relays (£494), reverse-power relays (£1,681).—Metropolitan-Vickers Electrical Co., Ltd.

Postmaster-General's Department.
Accumulator plates (£1,407).—Tudor Accumulator Co., Ltd.

Adelaide.—Postmaster-General's Department.
Telephone switchboard material at the Central, Unley, Norwood, and Hyde telephone exchanges (£4,029).—Western Electric Co. (Aust.), Ltd.
—*TENDERS.*

Barrow.—Electricity Committee. Recommended:—
E.h.p. transmission lines in connection with the supply to Grange, &c. (£16,903).—Johnson & Phillips, Ltd.

Bradford.—Tramways Committee. Accepted:—
20 tons track brake blocks (£190) and 30 tons Peckham hand-brake shoes (£300).—Cole, Marchent & Morley, Ltd.
24 tramcar split-gear wheels (£164).—Alfred Wiseman, Ltd.
100 steel tires for tramcar wheels (£300).—John Brown & Co., Ltd.

Bournemouth.—Town Council. Accepted:—
Reconstruction of the Poole (tramway) line (£19,617).—Alex. Stark and Sons, Ltd.
Tramway rails (£6,390).—Cargo Fleet Iron Co.
20 car sets of electrical equipment (£11,680); 20 B.W. magnetic and track brakes (£5,900); spares (£1,840).—Metropolitan-Vickers Electrical Co., Ltd.
20 car bodies (£27,200); 20 pairs of Maximum traction trucks (£5,700).—Brush Electrical Engineering Co., Ltd.

Chester.—Board of Guardians. Accepted:—
Electrical goods for the Institution.—Commercial Electrical Co.

Colchester.—
Electric lighting installation at Wolterton Hall.—Truslove & Co.

Edlington.—Rural Council. Accepted:—
Wiring houses for electric light (£264).—Building & Colliery Supply Co., Ltd.

Glasgow.—Electricity Committee. Recommended:—
Two 400-kVA transformers for sub-stations (£1,014).—Metropolitan-Vickers Electrical Co., Ltd. Two ditto, ditto (£1,014).—British Electric Transformer Co., Ltd.

Hastings.—Town Council. Accepted:—
Cable (£7,565).—W. T. Glover & Co., Ltd.

Imatra.—It is reported that Brown, Boveri & Co., of Mannheim, have secured, in international competition, an order from the Finnish Government for the supply of high-pressure equipment both for the Imatra hydro-electric works and for six transformer stations. The value of the order is put at £150,000.

London.—London County Council.—Education Committee. Accepted:—
Wiring and fittings for electric lighting at the Paddington and Maida Vale High School (£450).—Star Electrical Co., Ltd.

Manchester.—Paving, &c., Committee. Accepted:—
Re-insulating main cable in connection with penstocks in Essex Street, Old Trafford.—Lancaster & Bowen, Ltd.

Tramways Committee. Accepted:—
Battery-charging equipment.—Lancashire Dynamo & Motor Co., Ltd.
One b.h.p. motor, &c.—Veritys, Ltd.

Education Committee.
Electric lighting installations, Harpurhey High School and Queen Street Central School.—J. A. Somerset & Co.

Newcastle-on-Tyne.—The daily Press states that the City Council has accepted the tender of the United States Steel Products Co. for a tramway junction, the offer being 25 to 30 per cent. lower than any other.

Richmond-on-Thames.—Board of Guardians. Accepted:
Installing electric light at the Grove Road Institution (£609).—Richmond Electric Light and Power Co., Ltd.

Sheffield.—Electric Supply Committee. Accepted:—
Transformers (£2,052).—British Electric Transformer Co., Ltd.

Weymouth.—Electricity Committee. Recommended:—
510 yd. of cable (£228).—Johnson & Phillips, Ltd.

Winchester.—Town Council. Accepted:—
One 1,250-kW geared turbo-generating set (£5,435); condensing plant, with a condenser of 2,450 sq. ft. cooling surface (£2,467); contingencies (£198).—British Thomson-Houston Co., Ltd.

Forthcoming Events.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, October 17th. At the South Wales Institute of Engineers, Cardiff. At 6 p.m. Paper on the "Transmission of Power by Leather Belting," by Mr. T. Cliff Brown.

Electrical Power Engineers' Association (Southern Division).—Saturday, October 17th. At the Hotel Cecil, Strand, W.C. At 5.30 for 6 p.m. Annual dinner.

Batti-Wallahs' Society.—Wednesday, October 21st. At the Hotel Cecil. Luncheon. Speaker, Sir Hugo Hirst, Bart.

Institution of Electrical Engineers.—Thursday, October 22nd. At the Institution, Victoria Embankment, W.C. At 6 p.m. Presidential address by Mr. R. A. Chattock.

(South-Midland Centre).—Wednesday, October 21st. At the Grand Hotel, Birmingham. At 6.45 p.m. Inaugural address by the Chairman, Mr. F. J. Moffett.

(Dundee Sub-Centre).—Thursday, October 22nd. At the University College, Dundee. At 7.30 p.m. Address by the Chairman, Mr. J. S. Thomson.

(Sheffield Sub-Centre).—Wednesday, October 21st. At the Royal Victoria Hotel, Sheffield. At 7.30 p.m. Address by the chairman, Mr. W. F. Mylan, and smoking concert.

Junior Institution of Engineers.—Friday, October 23rd. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette, "The Construction and Laying of Reinforced Concrete Pipes," by Mr. H. S. Brown.

(North-Western Section).—Monday, October 19th. At the Geographical Society's Room, 16, St. Mary's Parsonage, Manchester. Lecturette, "Engineering Troubles," by Mr. A. N. Haworth.

Birmingham Electric Club.—Friday, October 23rd. At the Grand Hotel, Colmore Row. From 7 p.m. to 2 a.m. Ladies' evening. Ball and whist drive.

Physical Society of London.—Friday, October 23rd. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary scientific meeting.

Engineers' Club (London).—Friday, October 23rd. At the Savoy Hotel, Strand, W.C. Annual dinner.

Institution of Mechanical Engineers.—Friday, October 23rd. At the Institution, Storey's Gate, S.W. At 6 p.m. Presidential address by Sir Vincent L. Raven, K.B.E.

Notes.

Sir Adam Beck's Successors.—Writing with reference to the death of Sir Adam Beck and the consequent new appointments to the Hydro-Electric Power Commission of Ontario, our Canadian correspondent says:—"At the time of Sir Adam's death there was only one other Commissioner, the Hon. J. R. Cooke, serving on the Hydro-Electric Power Commission, although the normal number of Commissioners is three. Since that event the Ontario Government has appointed two Commissioners, bringing the total to three again; these are C. A. Magrath and C. A. Maguire, the former being chairman. The choice of Mr. Magrath was undoubtedly made on account of his intimate knowledge of problems connected with the development of the St. Lawrence river, and few men in Canada can know this subject as he does, for he has been the chairman of the Canadian Section of the International Joint Commission since 1911, and has not yet relinquished that post. During this period this Commission has had referred to it by the Governments of the United States and Canada many problems relating to transportation and water power development on the international waters separating the two countries, including those of the Niagara and St. Lawrence rivers, as well as of the Great Lakes. The new chairman and the Hon. J. R. Cooke are both, it is understood, men who are interested in the eastern section of the province, and no doubt this section will receive somewhat more attention in the future than it has done in the past, although it was perfectly natural that the needs of South-Western Ontario should have been taken care of first, because of early hydro-electric development at Niagara Falls and on account of the greater density of population in that part of the province. Mr. Maguire, the third Commissioner, has for several years taken an active interest in the work of the Hydro-Electric Power Commission of Ontario, and has fought for the cause of public ownership on many occasions, and in 1922 and 1923 he was Mayor of Toronto. The new appointments have been very generally approved in all parts of Ontario."

The Batti-Wallahs.—The Batti-Wallahs' Society opens the new session with a luncheon at the Hotel Cecil on Wednesday's October 21st. Sir Hugo Hirst, Bart., will speak on questions of industrial interest.

The Electrical Association for Women.—The above Association has received an invitation from the E.L.M.A. Lighting Service Bureau (15, Savoy Street, Strand, W.C.) to a lecture and discussion on "Home Lighting," by Miss Florence Hodge, on October 20th, at 3.30 p.m. The main lines of the lecture will be: Light from the point of view of health, comfort, and beauty. An invitation has also been received from Mr. Percy Best to visit a special display of electrical apparatus at Messrs. Shoolbreds (Tottenham Court Road, W.) on November 3rd, at 3.30 p.m. A lecture on "The Artistic Value of Electricity in the Home" will be given. In response to a number of requests from those employed in the electrical industry, domestic science teachers and lecturers, a series of three lectures is being arranged, giving a brief review of the electrical industry, its economic features, meaning and purpose, with simple explanations of electrical phraseology, &c. It is proposed to hold these lectures in the London centre.

Electricity Supply at Stoke-on-Trent.—Hanley Extensions.—Yesterday an addition to the plant of a Metropolitan-Vickers 6,000-kW turbo-generator, with four Stirling boilers and two Davenport cooling towers, was to be officially inaugurated. Particulars will be given in a later issue.

Scientific and Industrial Research.—The report of the Committee of the Privy Council for Scientific and Industrial Research for the year 1924-25 has been published by the Stationery Office (Cmd. 2491, price 3s. net). It will be reviewed in our next issue.

Electric Signals for Road Traffic Regulation.—For many years the state of traffic in Paris was little less than a by-word; there was very little regulation, and taxi drivers went where they liked, how they liked. Some years ago some members of the Paris police were sent over here to study London methods, and things gradually got better, until at present those who were pupils have in some ways improved on their former teachers. In order to aid traffic control illuminated signals have been put up on independent pillars, or have been attached to existing lamp standards. Perhaps the point in Paris with the heaviest traffic is where the Avenue de l'Opéra with the Rue de la Paix and the Rue 4 Septembre meets the Grands Boulevards.

At this crossing a number of circular signal lanterns with top shades have been placed on lamp-post islands, facing towards the oncoming traffic, with a word indicating "Stop" in white letters on a red ground. These lamps are fixed at a height sufficient to enable them to be seen by drivers some little distance away. When traffic is to be held up from one quarter the current is switched on to the lamp, and a red light is shown which aids the policeman on point duty. When the road is about to be made clear an electric bell is rung giving a warning to drivers to stand by, and the lamp

Traffic Control Signal in Paris.

is switched off, another lamp or group of lamps being switched on to block cross routes. At the point in question the lamps are controlled at a central switch box on the kerb in front of the stairs leading down to the underground railway, and a traffic director can therefore control the traffic to and from the seven converging roads. There are apparently repeaters further back which can be switched on when required.

A great improvement also has been made by the arrangement of one-way streets, some quite important thoroughfares being arranged in this way; for instance, the street from the Opera Square in question towards St. Lazare Station. The improvement in general traffic must easily make up for having to go beyond and round through a cross street and back to the point required.

To indicate unidirectional streets there are red disks in minor streets illuminated at night by neighbouring existing street lamps, and in a number of important streets there are standards each with a translucent, semi-circumferential sign, with white letters on a red ground, indicating that the direction facing the indicator is forbidden to traffic. Attention is further drawn to the sign by a flashing red signal lamp placed above the sign, which by the flashes tends to catch the eye of the motor driver.

The Ministry of Transport has investigated this system of lamp signals, which is now used at a number of points in Paris, and is about to carry out experiments in London on similar lines.

Fatalities.—A verdict of "Death by misadventure" was returned at an inquest at Scunthorpe, Lincs., on October 7th, into the death of Walter Bates (27), floor layer, who was killed in the new Crosby Parish Church which was consecrated recently. Bates was working in the church and took hold of a temporary lamp fitting, receiving a shock. The patent jointless floor of sawdust and certain acids made a good conductor, and the man's damp clothing and boots combined to bring about the shock. In returning the verdict the jury added that no blame could be attached to anyone.

The circumstances of the death of Mr. Victor John Scott (33), electrician, employed by Messrs. Geo. Hargreaves & Co., at Calder Pit, Altham, Lancs., whose body was recovered from a lodge, were investigated by the coroner on October 9th. The latter returned a verdict that deceased walked into the lodge by mistake, and thus met his death by drowning accidentally.

Manchester Electro-Harmonic Society.—To-night, Friday, at the Albion Hotel, Piccadilly, Manchester, the seventh season of the Manchester Electro-Harmonic Society will be opened with the first of a series of six monthly concerts. Mr. S. L. Pearce has been compelled to relinquish the presidency, owing to his recent appointment as an Electricity Commissioner and his removal to London. His influence and support have been highly appreciated. Mr. J. A. Robertson, M.I.E.E., is succeeding Mr. Pearce as president. We understand that the prospects for a highly successful season are very bright. The Society was inaugurated to provide an opportunity for those employed in all sections of the electrical industry to meet together for entertainment and social intercourse during the winter months. The President and Committee, therefore, extend a hearty invitation to members of all sections of the industry within easy access of the meeting place, to become members. They also extend a hearty invitation to representatives of electrical companies from other towns who may be visiting Manchester on the dates of the Society's meetings, which are as follow:—1925—October 16th, November 20th, December 18th; 1926—January 15th, February 19th, March 19th. The presentation of a trade card will be sufficient introduction, and no charge is made for admission. The membership is steadily increasing. Mr. W. J. Smith has again consented to act as hon. musical director, and the splendid services rendered in this capacity in the past are a guarantee of the excellence of future programmes. For to-night's concert the artistes will be:—Soprano, Madame Sophie Thomson de Konshen; contralto, Miss May Carrington; baritone, Mr. S. Hutchins; entertainer, Mr. Livingston Eccles; pianist and accompanist, Mr. Granville Hill. Correspondence relating to membership in, or contemplated visits to, the Society should be addressed to the hon. secretary, Mr. C. E. Leak, 196, Deansgate, Manchester, or to the assistant hon. secretary, Mr. W. Kirkham, 14, Ellesmere Road, Chorlton-cum-Hardy. Subscriptions for the season, now due, should be sent to the hon. treasurer, Mr. H. Marlor, the Manchester Corporation Electricity Department, Town Hall, Manchester.

Faraday House Old Students' Association.—The seventeenth annual dinner of the Association will be held at the Piccadilly Hotel, on Friday, November 6th. Mr. H. W. H. Richards, M.I.E.E., electrical engineer to the London and North-Eastern Railway, President of the Association, will be in the chair. Members of the Association are reminded that they may introduce guests, who need not necessarily be Faradians. A musical entertainment will, as usual, follow the dinner, and early application for tickets (price 12s. 6d. each) should be made to Mr. H. W. Fairman, Faraday House, Southampton Row, London, W.C.1.

Electricity Supply in Fulham.—Inauguration of Extensions.—The new extension at the Townmead Road generating station of the Metropolitan Borough of Fulham was opened on Tuesday last by the Mayoress of Fulham, Mrs. E. H. Pritchard, in the presence of a large and representative gathering. The total capacity of the station is now just over 18,000 kW. The new plant comprises two turbo-alternators rated at 6,000 kW at 0.8 p.f., 6,600 volts, 50 cycles; three boilers, each evaporating 40,000 lb. per hour at 275 lb. per sq. in. with a total temperature of 700 deg. F. at the turbine stop valve; Scott-connected transformers; ironclad switchgear; and all the necessary auxiliaries, including mechanical equipment for the delivery of coal and removal of ashes.

Those present at the inaugural function afterwards attended a luncheon in the Fulham Town Hall, at the invitation of the chairman and directors of Messrs. Vickers, Ltd., the sole contractors for the extensions. The chairman at this function was Sir Vincent Caillard, D.L., J.P., who, in proposing the toast of the Borough of Fulham, coupled with the Electricity and Lighting Departments, paid tribute to the many advantages offered by the borough, including that of a progressive policy with regard to electricity supply. Fulham was fortunate in having so excellent a site for its electricity undertaking, with an adequate supply of condensing water, cheap transport facilities for coal, and room for easy and economical extensions as required. In replying to this toast, Councillor D. S. Van den Bergh, chairman of the Electricity Committee, said that the policy in Fulham had been to supply electricity at the lowest possible price consistent with the economical and efficient running of the power station. During the past three years no less than £14,000 had been handed over for the relief of rates in the borough. The cost of electricity for lighting had been reduced by 1½d. per unit, and for power by ½d. per unit, and, with the increased production now possible, it was hoped that the Townmead Road plant would become the cheapest public supply station in London. In placing the order for the present extensions with Messrs. Vickers, the Committee had been influenced by the fact that

the firm's organisation was such that it could undertake the whole contract. British labour and British material had been used throughout, local unemployed had been used wherever possible for work on the site, and the Committee felt entirely justified in having given the contract to a British firm, notwithstanding the lower tenders received from abroad.

Mr. Arthur J. Fuller, M.I.E.E., borough consulting and electrical engineer, also spoke in reply, and gave interesting figures concerning the rapid growth of the undertaking. On account of its admirable site and the efficiency of the works, he said, the Fulham generating station might eventually take an active part in the development of electricity supply far beyond the limits of the borough. The amount of money spent on installing electric lighting, &c., in Fulham averaged about £20,000 per annum, and during the past 18 months 600 small properties had been connected, the average rental of which would not exceed 15s. per week. There could be no doubt that further extensions would be required in the near future. A point of vital importance in the extensions just completed had been the fact that Messrs. Vickers had got the first machine running in six months from the date of signing the contract, notwithstanding the delay occasioned by the building strike and other labour troubles. But for this record performance, it would not have been possible to meet the demand on the station last winter.

The toast of "The Contractors" was proposed by Councillor E. R. Armfield, J.P., vice-chairman of the Electricity Committee, and in his reply Sir Philip Nash, K.C.M.G., C.B., spoke of the advantages accruing from the vast resources of the companies associated in the Vickers group. Last year his own company alone had supplied machinery and equipment to 20 different nations, and it was the experience obtained in this way which made it possible for a single concern to deal with such a comprehensive scheme as the Fulham extension. The health of the Chairman was proposed by the Mayor of Fulham, Councillor E. H. Pritchard, B.A., J.P., and a kinematograph display was then given to demonstrate the progress of work on the extensions and the varied nature of the equipment needed to build and operate a modern power station.

"Reco" Batteries.—Correction.—It appears that our recent remarks regarding the Radio Equipment Co.'s batteries have been taken to imply that these batteries are only suitable for d.c. supply. We are asked to point out that both the high- and low-pressure batteries of this type can be supplied for use on a.c. as well as d.c. circuits.

Appointments Vacant.—Assistant power station chemist (250 taels per month; tael=3s.) for the Shanghai Municipal Council Electricity Department. Two junior charge engineers for the City and County of Bristol Electricity Department. Assistant mains engineer for the Borough of Portsmouth Electricity Department. Switchboard attendant, for Newport Corporation Electricity Department. Meter mechanic, for Rawtenstall Corporation Electricity Department. (See our advertisement pages to-day.)

The "Public Address" System.—The Western Electric "Public Address" system of loud speakers has been installed by Mr. E. J. Allan, for the Corporation, in the Caird Hall at Dundee. On being tested by members of the Town Council the system was described as very satisfactory.

Institution Notes.

Institution of Electrical Engineers.—Midland Sub-Centre.—The Midland Sub-Centre held its opening meeting at Loughborough, when Mr. B. Adair M. Royce, chairman, gave an address on "Energy." Starting from the dictum that energy was the basis of life, the lecturer went on to indicate the sun as the primary source of all energy—the mechanical energy in the rotation of the earth, the heat energy in the interior of the earth, and radio-active energy. If it were possible to increase the length of the day by five minutes, he said, by decreasing the speed of the rotation of the earth, the stored energy released would amount to 1,000 million h.p. for 70,000 years. We made comparatively inefficient use of the energy that we could control. In a modern medium-sized electricity generating station we only got 15 per cent. of the heat of the coal as electrical energy and threw away 61.6 per cent. of this heat in the condensing water. Of 249 million tons of coal raised in Great Britain in 1922, only 2.7 per cent. was used in electrical generating stations, while domestic fuel accounted for 15.2 per cent., probably the most inefficient way of using coal. The figures for the electricity used in 1922-23 showed that 80 per cent. of the population used under 100 kWh per head, and only 1.1 per cent. used 300 or over. In 1920 the figures for the United States were 176 kWh per head, against our 60, and about the same ratio existed to-day. Comparing the efficiency of the human body with generating stations, he said the useful efficiency of the body was about 10 per cent., nine-tenths of the energy being used to maintain the body heat. The average available energy per day was only about 340 foot-tons, or just over a quarter of a kWh, costing about three-halfpence at the Loughborough lighting rate. It was more efficient to buy energy through a meter for every possible purpose in life than to use muscular energy. Mr. W. Pearson presided, and the annual report presented by Mr. J. F. Driver, the hon. secretary, showed that the membership had increased from 110 in 1920 to 321.

Association of Mining Electrical Engineers (London Branch).—The following is the programme of London meetings for the new session:—November 10th, 1925: Presidential address, by J. W. Gibson. December 8th: "Mining in Other Countries," by H. M. Morgans. January 12th, 1926: "Rescue Apparatus for Mines, including Demonstration of Certain Apparatus," by Siebe Gorman, Ltd. February 9th: "Mining Signalling Apparatus and Telephones," by O. D. Kennedy. March 13th: Visit to Chislett Colliery.—"Some Notes on the Electrical Plant at Chislett Colliery," by C. Dawson. April 13th: "Coal Screening, Crushing, Blending and Conveying Apparatus," by F. H. F. Hampton. The meetings will be held at the Engineers' Club, Coventry Street, W.1, at 6.30 p.m.

The Physical Society of London and The Optical Society.—Annual Exhibition.—The Councils of the above Societies have decided to extend the scope of the Exhibition of Electrical, Optical and other Physical Apparatus (January 5th, 6th and 7th, 1926) by including, in addition to the usual display by instrument makers, the following new classes of exhibits:—(*a*) Exhibits illustrating the results of recent physical research and improvements in laboratory practice. (*b*) Selected examples of effective lecture experiments. (*c*) Repetitions of famous historical experiments in physics. Accommodation for these will be provided in a part of the Imperial College distinct from that devoted to the trade exhibits, and a section of the catalogue will be allotted to them. No charge will be made for space or catalogue entries in the new classes, and the facilities of the Imperial College will be at the disposal of exhibitors. The object in view in inviting exhibits of classes (*a*) and (*b*) is to afford to teachers and research workers an opportunity for interchanging ideas and disseminating information on matters relating to their work in practical physics. The exhibits in class (*c*) will be of interest not only to the scientific worker, but to the general public, who will have an opportunity on the third day of attending the exhibition. Offers giving preliminary particulars should be addressed to the secretary of the Physical Society at the Imperial College of Science, South Kensington, as early as possible, and not later than November 16th.

Diesel Engine Users' Association.—Scottish Shale Oil.—A considerable amount of interest was taken in the paper on "The Scottish Shale Oil Industry," which was read by Mr. Edwin M. Bailey at the October meeting of the Association. The author pointed out that as the cost of mining and retorting the shale amounted to about 80 per cent. of the total cost of manufacture of the marketable products, in the Scottish industry at present, it was obvious that cheap shale and cheap retorting might be very important factors in the creation and survival of the new oil industry. In the discussion several speakers referred to the possibility of obtaining supplies of liquid fuel from shale deposits or coal in this country, and to the importance of doing everything possible to establish such a home-industry instead of remaining almost entirely dependent upon foreign imports of petroleum products.

Institution of Engineering Inspection.—At the meeting of the Institution to be held at the Royal Society of Arts, John Street, Adelphi, W.C., on Friday, November 13th, a paper will be read by Mr. W. H. Hatfield on "Modern Developments in Steel Resistant to Corrosion."

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

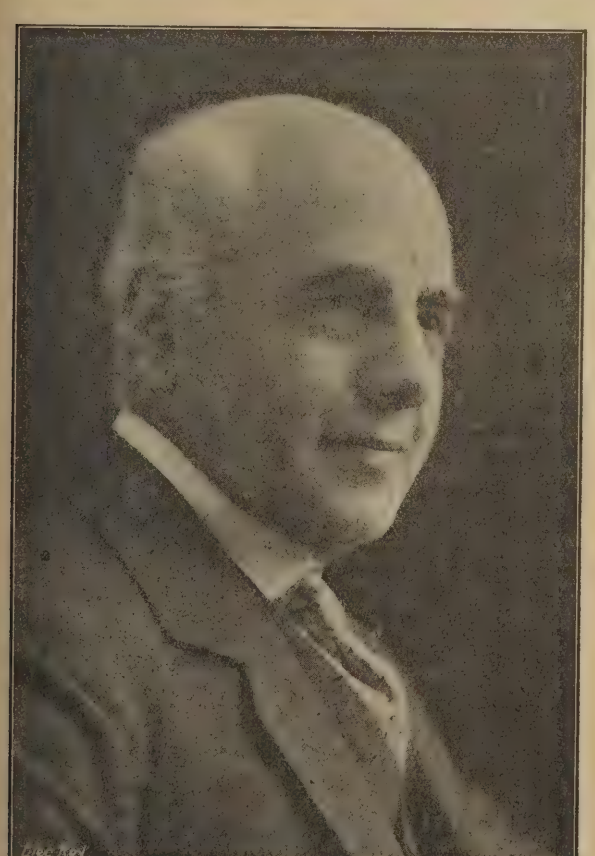
After 35 years' service in Liverpool and Manchester with the General Electric Co., Ltd., Mr. Fred Crawford, the Liverpool manager, has been presented with a gold cigarette case by the directors, and an illuminated address by his colleagues. The Liverpool staff gave Mrs. Crawford a rose bowl. The presentations were made at a dinner at the Adelphi Hotel, when Mr. J. H. Farthing, the northern district manager, took the chair.

Mr. W. Walker, managing director of Messrs. Baxendale Bros., Ltd., has been installed Worshipful Master of King George the 5th Lodge, No. 3514 Cheshire.

With further reference to the visit to this country of Mr. Forbes Mackay, the engineer and general manager of the Sydney (N.S.W.) Corporation electricity undertaking, we understand that he is now on his way. His visit is for the purpose of calling for tenders for plant required for the new power house, and he expects to arrive in November. The first section of the station will probably comprise 120,000 kW of plant. Mr. Mackay will on his arrival advertise for tenders and will be available at Messrs. Preece, Cardew & Rider's office, 8, Queen Anne's Gate, Westminster, S.W.1, for one or two months, to give information to firms on this side who propose to submit tenders in Sydney.

According to a dispatch from Adelaide to the *Daily Mail*, Sir Frank Heath, Secretary to the Department of Scientific and Industrial Research, London, has arrived in the *Nestor* to investigate the possibilities of Britain and Australia co-operating in the solution of scientific and technical problems affecting trade and commerce.

Indian Engineering just to hand understands that the six months' leave granted to Mr. P. Hawkins, Chief Engineer, and Secretary to the Government of Madras, P. W. D., Irrigation, has been cancelled. Mr. Hawkins will remain as Chief Engineer for the hydro-electric development in Madras. The same contemporary states that Mr. Satyendra Nath Ray, M.Sc., who stood first in B.Sc. with First Class Honours in Physics, has been awarded the Tata Scholarship in Wireless of Rs. 15,000, to carry on researches in wireless and electricity at Faraday House, London. He recently left for England.



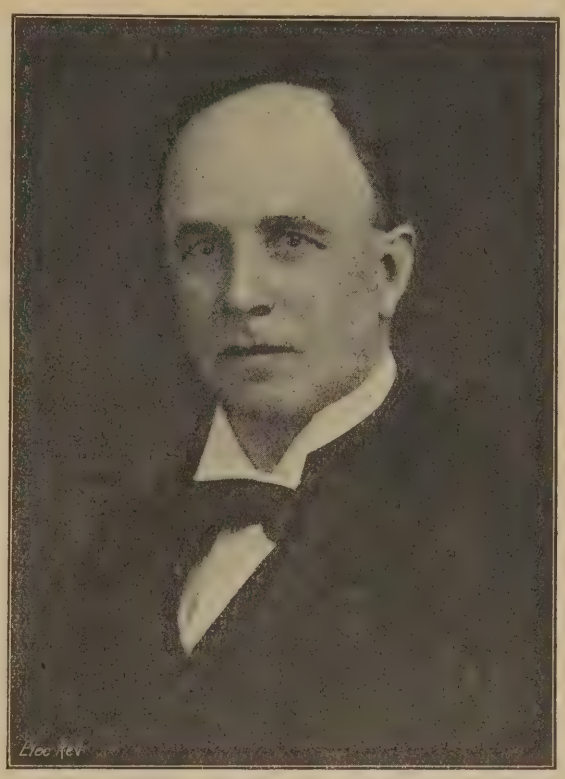
At a meeting of the Council of the University of Birmingham on October 7th, bound volumes for use in the Electrical Engineering Department were received from Mr. J. C. Vaudrey.

Candidates in the forthcoming municipal elections at Bradford include Mr. J. W. Longley (Conservative), consulting electrical engineer, and vice-chairman of the Corporation Electricity Committee for some years past, in Allerton ward; and Mr. Louis Jessop (Jessop & Boydell, Ltd., electrical contractors), who stands as a Liberal for the Great Horton ward.

Mr. C. H. Astle, of the Wrexham Corporation Electricity staff, has been presented by his colleagues with a Jacobean oak mirror on the occasion of his marriage.

Mr. Jos. H. Quicke, A.M.I.Mech.E., recently went out from London to take up the position of general manager to the Madeira Supply Co., Ltd., general engineers and founders, Funchal, Madeira.

Mr. J. William Burr, M.I.E.E., M.I.Mech.E., whose inaugural address to the Western Centre of the Institution of Electrical Engineers, of which he is the chairman, appears in abstract on another page of this issue, is the borough electrical engineer and manager at Swansea. He was born in London, and was educated and served his apprenticeship there, but much of his technical training was obtained on the Continent. Upon his return to England he took up a position at Kingston-on-Thames, but very shortly afterwards he received an appointment at the Deptford works of the London Electric Supply Corporation, where he remained for seven years. He left Deptford to enter service under Mr. John Young, manager of the Glasgow Corporation tramways undertaking, and spent two years there during the construction of the Pinkston power station. Later he came south to Reading and subsequently became deputy engineer and manager at Croydon, which office he resigned in 1914 to take up the post that he now holds at Swansea.



Elliott & Fry] [*London.*

Mr. J. W. Burr.

Chairman of the Western Centre of the I.E.E.

Mr. J. W. Wardle, who has for 19 years been a designer at Newtons' Electrical Works at Taunton, is leaving to become the firm's first direct representative in Australia, and he has been presented by his colleagues with a leather travelling case fitted with toilet requisites.

Mr. B. Adair M. Boyce, whose portrait is reproduced herewith, and who has been elected chairman of the East Midland Sub-Centre of the Institution of Electrical Engineers for the coming session, was educated generally at Jersey and the Bath Grammar School, and in mechanical and electrical engineering at the University College, London. In 1902 he joined the General Electric Co., Ltd., as an assistant designer at its Witton works, which post he vacated in 1911 in order to accept the position of chief assistant designer with the Brush Electrical Engineering Co. at Loughborough. A year later Mr. Boyce was appointed chief electrical designer by the same firm and this position he holds to-day. Mr. Boyce is an active member of the Electrical Research Association and is serving on several of its committees. Mr. Boyce is also an Associate of the American Institution of Electrical Engineers.

Ramsden] [*Leicester.*

Mr. B. Adair M. Boyce.

Chairman of the East Midland Sub-Centre of the I.E.E.

There were 40 candidates for the position of general manager and engineer of Wigan Tramways and Motor Department, rendered vacant by the death of Mr. W. Mayall Milnes. Some have been selected to appear before the Tramways Committee.

At a meeting of the Bradford Education Committee it was reported that Mr. H. J. B. Chapple, Lecturer in Electrical Engineering at the Technical College, had tendered his resignation in order to take up a commercial appointment in London.

Obituary.—Mr. D. I. Dawbarn.—We regret to learn from Messrs. A. Reyrolle & Co., Ltd., of the death which occurred on October 1st, in a motor accident at Milwaukee, Wisconsin, of Mr. David Inglis Dawbarn. Mr. Dawbarn left Messrs. Reyrolle's works last April, to take up his duties as American representative, and he has been rendering excellent service to the company. He was born in 1896. He was educated at Merchant Taylor's School, and took First Class Honours in the Oxford Senior Locals in 1913. He proceeded to the University of Liverpool, and there obtained First Class Honours in the examination as Bachelor of Engineering. After five years spent with the Forces during the war he helped Professor Marchant, D.Sc., for two years with research work for the Board of Scientific and Industrial Research, the results of this work being published in the *Journal* of the Institution of Electrical Engineers. In 1922, he joined Messrs. Reyrolle on a two years' Student Apprentice's Course, on the completion of which he was transferred to the sales department, where he was engaged as an assistant engineer in the contracts and estimates section, before being appointed representative for U.S.A. He was an Associate Member of the Institution of Civil Engineers and at the time of his death was awaiting his election as an Associate Member of the Institution of Electrical Engineers, of which he was a Student Member. He was also awarded one of the Students' Premiums of the I.E.E. for a paper read in 1924 on "Variable-Speed 3-Phase Commutator Motors." Messrs. Reyrolle testify to Mr. Dawbarn's consistent thoroughness and reliability and to the esteem in which he was widely held. The funeral took place in Milwaukee on October 5th.

Mr. A. Handford.—Mr. Alfred Handford, traffic and claims superintendent of the Sheffield Corporation tramways, passed away recently following a seizure. He was 63 years old, and he passed away on his birthday.

Prof. A. Gray.—We regret to learn that Prof. Andrew Gray, D.Sc., LL.D., F.R.S., Emeritus Professor of Natural Philosophy at the University of Glasgow, who succeeded Lord Kelvin at the University in 1899, has passed away. He was 78 years of age. We shall make further reference to his work and career in our next issue.

Mr. R. Ballantyne.—The death is reported of Mr. Robert Ballantyne, a director of Messrs. Stewarts & Lloyds, Ltd.

Captain H. R. Sankey.—At the funeral of the late Captain H. R. Sankey, past-president of the Institution of Mechanical Engineers, on October 7th, the Institution of Electrical Engineers was represented by its president, Mr. R. A. Chattock, M.I.E.E.

Mr. V. Stott.—The death occurred on October 7th of Mr. V. Stott, head electrician at the collieries of George Hargreaves and Co., Huncoat, Accrington. He was 32 years of age. It is stated that in the darkness he accidentally walked into a water pit and was drowned.

Mr. R. F. Halliwell.—We regret to record that Mr. Reginald Francis Halliwell, M.I.Mech.E., principal steam turbine designer to the British Thomson-Houston Co., Ltd., at Rugby, died on October 10th at the age of 54 years, after some weeks' illness, followed by an operation. Mr. Halliwell, after serving as engineer in the mercantile marine, joined Messrs. Willans & Robinson, Ltd., and subsequently Tubes, Ltd., and Messrs. Thornycroft, Ltd. He went to the B.T.-H. Co. in 1903.

New Companies Registered.

Pettigrew & Merriman (1925), Ltd. (208,795).—Registered as a public company on October 3rd with a nominal capital of £250,000 in 125,000 preference shares of £1 each and 500,000 ordinary shares of 5s. each. The cumulative preference shares are entitled out of the profits which the company determine to distribute to a cumulative preferential dividend of 7½ per cent.; subject thereto, the surplus is to be paid to the ordinary shareholders. Objects:—To acquire all or part of the business of mechanical and electrical engineers and wireless instrument manufacturers carried on by Pettigrew & Merriman, Ltd., in the United Kingdom and elsewhere, together with the whole of the assets and undertaking of Pettigrew & Merriman (Continental), Ltd., and to carry on the same and the business of manufacturers of electrical, wireless, and high-tension apparatus, valves, equipment, magnetic, and radioactive instruments, &c. Minimum cash subscription, £7. The directors are:—H. C. Rose, 67, Hervey Road, Blackheath, S.E.3, merchant; T. Pettigrew, 31, Little Heath, Charlton, S.E.7, electrical engineer; E. Merriman, Stanley House, Pitsea, electrical engineer; O. Brunet, 95, Avenue Mozart, Paris, engineer; P. Brunet, 95, Avenue Mozart, Paris, engineer; W. P. Mackintosh, 21, Kenilworth Court, Putney, S.W.15, kinema proprietor. Qualification, £500 stock or shares. Remuneration, £250 each per annum. Solicitors: Herbert Smith, Goss King and Gregory, 62, London Wall, E.C.2.

Nottingham Electrical Contractors' Trading Association, Ltd. (208,897).—Private company. Registered October 8th. Capital, £1,000 in £1 shares. Objects: To carry on in the U.K. or elsewhere all or any of the businesses of buying, selling, letting on hire, hire-purchase, or easy payment system of electrical appliances, installation, fitting, machinery, motor cars, taxicabs, tramcars, charabancs, motor lorries and wagons, and motor vehicles of all kinds, bicycles, coaches and carriages, agricultural implements and machinery, airships, aeroplanes and balloons, manufacturers of and dealers in wires, lamps, fittings, accumulators, batteries, dynamos, telephonic and telegraphic instruments, wireless goods, &c. The subscribers (each with one share) are:—R. B. Baggaley, 27, Tavistock Drive, Nottingham, chartered accountant; C. Thompson, 31, Burlington Road, Nottingham, chartered accountant. The first directors are not named. Secretary: C. Thompson. Solicitor: J. E. M. Crowther, 23, Abingdon Street, Westminster.

Euradic Electric Co., Ltd. (208,792).—Private company. Registered October 3rd. Capital, £1,000 in 2,000 founders' shares of 1s. and 900 ordinary shares of £1. Objects: To adopt an agreement with H. C. Pontet and Muriel I. Pontet to develop and turn to account the business referred to therein, to manufacture and deal in wireless, telegraphic and telephonic apparatus, machinery, conveniences, valves, electrical, magnetic and radio-active instruments, electricians, &c. The directors are:—H. C. Pontet, 4, Seymour Street, Euston, N.W.1, electrical engineer; Mrs. M. I. Pontet, 4, Seymour Street, Euston, N.W.1 (both permanent). Qualification, 50 ordinary shares. Secretary: A. E. Kent. Solicitors: Foster, Martindale and Clark, Millbrook Chambers, Camden Town, N.W.1.

McKenzie & Holland, Ltd. (208,915).—Private company. Registered October 9th. Capital, £100 in £1 shares. Objects:—To carry on the business of manufacturers of railway signals, locking apparatus, and safety appliances, mechanical engineers, and electricians, &c. The subscribers (each with one share) are:—H. G. Brown, "Four Winds," Bidborough, Kent, electrical engineer; R. Payne, 77, Braxted Park, Streatham Common, S.W.16, chartered accountant; B. H. Peter, 82, York Road, King's Cross, N.1, engineer. The first directors are to be appointed by the subscribers. No share qualification required. Solicitors: Linklaters and Paines, 2, Bond Court, Walbrook, E.C.4. Registered office: 82, York Road, King's Cross, N.1.

Official Returns of Electrical Companies.

Warnolite, Ltd.—Issue on September 26th, 1925, of £90 debentures, part of a series already registered.

Arrota Electrical and Motor Accessories Co., Ltd.—S. P. Child, of 36-37, Queen Street, E.C., was appointed receiver on July 15th, 1925, under powers contained in mortgage debentures dated May 11th, 1922.

Direct Spanish Telegraph Co., Ltd.—Particulars filed of £100,000 debentures authorised August 14th, 1925, charged on the company's undertaking and property, present and future, the whole amount being issued on October 1st, 1925.

Crampton & Co., Ltd. (109,328).—Return dated December 31st, 1924 (filed August 1st, 1925). Capital, £2,500 in £1 shares. All shares taken up. £2,500 paid. Mortgages and charges, nil.

Peterborough Electric Traction Co., Ltd. (74,562).—Return dated May 4th (filed September 16th), 1925. Capital, £60,000 in 6,000 preference and 6,000 ordinary shares of £5 each. 4,400 preference and 4,000 ordinary shares taken up. £42,000 paid. Mortgages and charges, £21,000.

H. P. Electrical Co., Ltd. (187,715).—Return dated September 15th, 1924 (filed March 12th, 1925). Capital, £1,000 in £1 shares. 654 shares taken up. £654 paid. Mortgages and charges, nil.

Keswick Electric Light Co., Ltd. (28,820).—Return dated April 9th (filed August 10th), 1925. Capital, £20,000 in 15,000 preference and 5,000 ordinary shares of £1 each. 3,420 ordinary shares taken up. £3,420 paid. Mortgages and charges, £10,100.

Edmundson's Electricity Corporation, Ltd. (52,013).—Return dated July 28th, 1925. Capital, £800,000 in 400,000 ordinary and 400,000 preference shares of £1 each. All shares taken up. £600,400 paid on 200,400 ordinary and 400,000 preference shares. £199,600 considered as paid on the remainder. Mortgages and charges £919,295.

Foster & Pullen, Ltd. (108,579). — Return dated August 21st, 1925. Capital, £5,000 in £1 shares. 4,436 shares taken up. £2,436 paid. £2,000 considered as paid. Mortgages and charges, £500.

Llangefni Electric Light and Power Co., Ltd. (111,909).—Return dated December 23rd, 1924 (filed August 26th, 1925). Capital, £3,000 in 2,750 preference and 250 ordinary shares of £1 each. 2,566 preference and 250 ordinary shares taken up. £2,566 paid. £250 considered as paid. Mortgages and charges, £2,400.

St. Helens Cable and Rubber Co., Ltd. (87,774).—Return dated May 27th, 1925. Capital, £100,000 in £1 shares. 84,000 shares taken up. £84,000 paid. Mortgages and charges, nil.

Walters Electrical Manufacturing Co., Ltd. (94,300).—Return dated July 28th, 1925. Capital, £18,000 in £1 shares. 16,875 shares taken up. £6,875 paid. £10,000 considered as paid. Mortgages and charges, nil.

Wark and District Electric Lighting Co., Ltd. (186,144).—Return dated May 14th, 1925. Capital, £1,500 in £1 shares. All shares taken up. £1,500 paid. Mortgages and charges, nil.

Presteign Electric Co., Ltd. (170,355).—Return dated May 15th, 1925. Capital, £5,000 in £1 shares. 630 shares taken up. £630 paid. Mortgages and charges, nil.

Blackburn, Starling & Co., Ltd. (61,302).—Capital, £12,000 in £1 shares. Return dated August 4th, 1925. All shares taken up. £8,100 paid. £3,900 considered as paid. Mortgages and charges, nil.

Vaughan Crane Co., Ltd. (61,526).—Capital, £150,000 in 50,000 preference and 100,000 ordinary shares of £1 each. Return dated September 4th, 1925. 16,780 preference and 53,578 ordinary shares taken up. £43,569 paid. £26,789 considered as paid. Mortgages and charges, nil. A further 100 preference shares were allotted, payable in cash, on September 7th, 1925.

Reason Manufacturing Co., Ltd. (64,701).—Capital, £52,500 in 5s. shares (200,000 preference and 10,000 ordinary). Return dated April 7th, 1925. 92,000 preference and 10,000 ordinary shares taken up. 5s. per share paid on 9,397 preference shares. £2,349 5s. paid. £23,150 15s. considered as paid on 82,603 preference and 10,000 ordinary shares. Mortgages and charges, £14,000.

Kalgoorlie Electric Tramways, Ltd. (73,127).—Capital, £250,000 in £1 shares. Return dated August 13th, 1925. All shares taken up. £250,000 paid. Mortgages and charges, £132,980.

Chili Telephone Co., Ltd.—Capital, £750,000 in £5 shares. Return dated July 23rd, 1925. All shares taken up. £431,000 paid. £319,000 considered as paid. Mortgages and charges, nil.

Royce, Ltd.—Capital, £170,000 in £1 shares (70,000 preference and 100,000 ordinary). Return dated September 7th, 1925. 34,955 preference and 72,487 ordinary shares taken up. £27,461 paid (being £1 per share on 4,955 preference and 6 ordinary and 15s. per share on 30,000 preference. £79,981 considered as paid (being £1 per share on 72,481 ordinary and 5s. per share on 30,000 preference). Mortgages and charges, £21,520 12s.

Newquay Electric Light and Power Co., Ltd. (85,451).—Capital, £15,000 in £1 shares. Return dated January 14th, 1925 (filed June 3rd). 18,124 shares taken up. £2,944 paid. £10,180 considered as paid. Mortgages and charges, £15,400.

Anglo Electric Co., Ltd.—Particulars filed of £3,000 debentures authorised September 25th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Argentine Light and Power Co.

The directors' report for the year ended March 31st, 1925, states, according to the *Financial News*, that the financial years of each of the company's subsidiaries in Argentina close on March 31st. Owing to the growth of the businesses it was found impossible to complete the audit of local accounts and have them dispatched to London for incorporation in this company's accounts in time to permit of the annual meeting being held before the summer vacation, as has been customary. "During the year the balance of share capital of the Argentine Tramways and Power Co., Ltd., was acquired. Whole of share and loan capital of that company, as also of Cordoba Light and Power Co. and Cordoba (Argentine) Electric Tramways Construction Co., Ltd., is therefore now the property of this company. Owing to improvement in the average rate of exchange on London, the loss on remittances was not so great as in the previous year, being £29,499, compared with £41,538. The sum received by way of interest and dividends from undertakings owned and other investments, together with sundry other receipts, totalled £192,545. After providing for administration expenses, interest on debenture stock, loss on exchange, and taxes, the profit and loss shows credit of £108,306; plus £13,766 brought forward, making £122,072. There is set aside for

debenture stock redemption £12,043, for share capital redemption £5,000, for general reserve £25,000." The directors recommend a dividend at the rate of 2½ per cent. on 952,211 ordinary shares for the year (after deduction of tax), leaving to be carried forward £15,133. The meeting is taking place in London to-day (Friday).

West India and Panama Telegraph Co., Ltd. The directors' report for the year 1924 states that the receipts amounted to £94,995 and the expenses to £90,106, leaving £4,889. This has been placed to reduction of the debit balance brought forward, which at December 31st, 1924, amounted to £77,190. The Government competitive system of cables and wireless was opened on December 1st, 1924. Annual subsidies of £26,300 ceased on September 30th, 1924, but, by request of the Pacific Cable Board, the company continued its service between those two dates, receiving remuneration for doing so; consequently the new competition is not reflected in the year's results. In November last a circular was sent to share and debenture holders conveying an offer made by the Cuba Submarine Telegraph Co. to purchase shares and debentures of the company. The offer was accepted by shareholders whose holdings exceeded the necessary majority of 80 per cent., as stipulated by the Cuba Submarine Co. The whole of the outstanding debentures have also been acquired by the Cuba Submarine Co. According to the *Financial News*, the former directors, with the exception of the nominee of the International Ocean Telegraph Co., resigned as at December 31st, 1924, and their places have been filled by members of the board of the Cuba Submarine Co.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Brisbane Tramway Trust.—£500,000 5¼ per cent. Brisbane Tramway stock, 1944-54, issued at 98¼ per cent., partly and fully paid.

Shropshire, Worcestershire, and Staffordshire Electric Power.—10,650 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1,135,206 to 1,145,855.

Stewarts & Lloyds.—8,725 deferred shares of £1 each, fully paid, Nos. 2,671,159 to 2,679,883.

Belgian Companies.—In order to extend their sphere of operations to meet the ever-increasing demand, several of the electricity supply undertakings in Belgium have lately made additions to their capital. Thus, the Société d'Electricité du pays de Liége has invited subscriptions for 20,000 new preference shares of 500 fr. each and 20,000 special shares of a similar value, a total of 20 million fr.; and the Société d'Electricité du Bassin de Charleroi for 1,000 new ordinary shares of 500 fr. offered at 800 fr. each.

United River Plate Telephone Co., Ltd.—The directors have decided to issue 152,000 ordinary shares of £5, ranking *pari passu* with the existing ordinary shares, and they are being offered at par to the holders of ordinary shares registered September 25th in the proportion of one new share for every complete multiple of five existing ordinary shares held. The new shares will not participate in the interim dividend to be paid in November in respect of 1925.

Brisbane Tramway Trust.—The Trust has been offering for public subscription in this country an issue of £500,000 5¼ per cent. Brisbane Tramway Stock 1944-1954, at £98 10s. per cent., the proceeds to be applied in the erection of new tramway sheds and for the necessary extensions to the system. The list was to close on or before last Monday.

Hurst, Nelson & Co., Ltd.—After placing to reserve £10,000, the directors recommend a dividend of 2s. and a bonus of 6d., both less tax, on the ordinary shares, leaving, after reserving £16,000 for interim ordinary dividend on May 15th next, £16,091 to be carried forward.

United Electric Tramways Co. of Caracas, Ltd.—According to the *Financial Times*, the net revenue for the year ended June, 1925, was £23,011, plus £17,741 brought forward. A dividend of 10 per cent., less tax, is recommended, leaving £22,796 to be carried forward.

Dundee, Broughty Ferry and District Tramways Co., Ltd.—It is proposed to pay dividend on ordinary shares at the rate of 7 per cent. per annum for the year, less tax, and to place to renewals fund £1,500, leaving to carry forward £145.

Western Electric Distributing Corporation, Ltd.—The dividend recommended by this company in its report for the year ended June 30th, 1925, makes a total of 10 per cent. on the ordinary shares, not 8 per cent. as stated in our last issue.

Anglo-American Telegraph Co., Ltd.—Interim dividends for the quarter ended September 30th: 15s. per cent. on the ordinary stock and £1 10s. per cent. on the preferred stock, less tax at 4s. in the £.

Oriental Telephone and Electric Co., Ltd.—The directors have declared interim dividends of 3½ per cent., less tax, on the 7 per cent. cumulative preference shares, and 4 per cent., free of tax, on the ordinary shares.

Yates & Thom, Ltd.—A dividend of 7½ per cent., less tax, on the ordinary shares for the year is recommended, carrying forward £15,554.

Monte Video Telephone Co., Ltd.—Final dividend of 5 per cent., less tax, making 7 per cent., less tax, for the year ended July 31st.

Babcock & Wilcox, Ltd.—Interim dividend of 5 per cent., free of tax.

Indo-European Telegraph Co., Ltd.—Interim dividend at rate of 5 per cent. per annum, free of tax.

Stocks and Shares.

Monday Evening.

The outstanding market in the Stock Exchange remains that for rubber shares, but there is a good deal of business going on in other departments, and, taking it all round, the Stock Exchange can scarcely complain of being unemployed. The excitement over rubber shares appears to have given something of a fillip to the speculative spirit. Any industrial shares are readily taken if they offer the prospect of capital improvement. People once more are begging their brokers to buy them something that stands a chance of an early rise, frankly declaring that they, the purchasers, disregard dividend considerations and put capital appreciation before anything else. This speculative flame serves to brighten the prices in a good many sections of the Stock Exchange, and it has its counter-effect amongst investment securities through the necessity for money to be raised from the sale of first-rate stocks by those people who are putting capital into shares of a more risky order.

On the other hand, investment pure and simple is fortified in the knowledge of a 4 per cent. Bank Rate and of the easy money conditions that this ensures. No doubt there will be the usual autumn rush of new issues, though fresh borrowing has been, during the past month or two, mercifully slow. It is known that the Government policy aims at conversion of short-dated stocks into some other security that shall mature later on, which means that there will be fairly constant offers of British Government security in exchange for existing stocks, a factor which lends its weight to keeping prices down amongst the investment securities. Nevertheless, the first-class Industrial debentures and preferences, for instance, such as those of the electrical and telegraph market, remain in such steady demand as to render the floating supply a very modest one, and, in spite of all the temptations to gamble, there are investors who refuse to be drawn away from the paths of safety and 5 per cent.

North Metropolitan Electric 6 per cent. preference shares have strengthened to 1½. Westminsters are better at 44s. 6d. Demand for South London led to 1/16 rise to 2 9/16. Save for these slight changes, the London list shows no alteration.

With perseverance worthy of a noble cause, the Southern Counties Electric Light & Power Supply, Ltd., continues to push its offers of debentures and participating preference shares. The first director's name on the application form is that of Sir Charles B. H. Soame, Bart. The company's covering letter is dated July, 1925, but there is a rubber-stamped "Sep.," above the earlier, printed date. The same application is used as that which accompanied the offer of the same issues last April, the only difference being that the latest form is printed upon paper coloured a vivid green.

Brazilian Tractions have gained another 3 points, and now stand at 77. The buying is still rumoured to be on behalf of people said to desire control of the company. Anglo-Argentine 5 per cent. debenture hardened to 77½. Argentine Light and Power ordinary have re-entered the dividend list, after an absence of 13 years. It is proposed to pay 2½ per cent., and this has induced a certain activity into the shares, which have risen to 12s. The company's 7 per cent. preference braced up to 20s. 6d. The British Columbia Electric Railway announces details of an ambitious programme for establishment of a power scheme, at a total cost of about 30 million dollars. Prices of the company's stocks are better on the idea that the proposals may involve an issue of new capital upon terms likely to give a bonus to present proprietors. It happens sometimes that the actual offer of stock tends to induce sales on the part of shareholders who exchange from the old into the new securities.

In the group of cable stocks, the quotation ex dividend of Eastern Extensions and Eastern Telegraph ordinary served to bring in a few buyers, and part of the deductions was recovered. Great Northerns are 5s. higher. Indo-Europeans remain at 42½, unaffected by declaration of the usual 5 per cent. tax-free interim dividend. United River Plate Telephones rallied to 7 1/16. Animated dealings in the new shares have resulted in an advance to 38s. premium. Canadian Marconis attract a good deal of attention around 7s. The parent shares are a quiet market again.

Babcock & Wilcox have declared an interim dividend of 5 per cent. free of tax, and the price keeps steady at 2½. Iron and steel issues are rather better, the market recovering from the unexpected postponement of the interim dividend payment upon Armstrong's junior preferences. Johnson & Phillips fell back to 46s. 3d. British Insulated rose sharply to 70s. buyers, a brisk demand coming upon a market bare of supply. Henley's advanced to 3¼. Edisons can be bought at 8s. or a little cheaper. Brush have gone back to 22s. and General Electrics to 26s., both being 1s. down on the week.

Metropolitan Consolidated gained 2, to 70½, but the recent rise in Districts has brought in profit-takers: the price eased off to 44. Underground Electrics are firm. Home Railway stock maintains a tolerably steady front, although a good deal has been sold by tired holders who have turned the proceeds into rubber shares. The market in these latter has received something of a check to its buoyancy owing to talk of early permission being granted to the companies to accelerate their production. This led to selling by speculators in the raw material and to a sympathetic, though slight, reaction amongst rubber shares.

Paisley Association of Electrical Engineers.—A large number of the members of the Paisley Association of Electrical Engineers met in Gibson's Tea Rooms on October 6th to hear Mr. James Neil give his presidential address on the electric wiring of houses. He emphasised the importance of building construction as a part of the training of apprentices, as it was very necessary that wiremen should have a knowledge of this subject. Mr. Neil dealt in a very practical way with every aspect of house wiring, giving his experience and knowledge of a subject on which he was well qualified to speak. The members present, says the *Paisley Daily Express*, were very much interested to hear all the different points raised, and a discussion took place after tea had been served, and was entered into with much enthusiasm by Messrs. Humphriss, Heys, Scott, Bruce, W. Blair Smith, Adam, Graham, Dodson, and Young. A vote of thanks to Mr. Neil for his very able paper was proposed by Mr. Barbour.

The Illumination of Firpo's Hotel, Calcutta.—In the lighting of the recently-opened Louis XVI ballroom of Firpo's Hotel, Calcutta, a highly original effect has been achieved. Each shade contains six Osram colour-sprayed lamps and one central 200-watt Osram clear gasfilled lamp, the latter on an entirely separate circuit and used for ordinary illumination only. A specially designed bank of switches, driven by a small G.E.C. motor, operates the six colour-sprayed lamps, producing the striking effect of revolving coloured lights. The installation was a great success, and was described in the local Indian Press as something unique for Calcutta. We understand, in addition, that four spotlights, a central prismatic mirror-bowl, and a specially designed flashing sign carried out in Osram daylight blue sign type lamps have since been installed.

Electrical Exhibitions and Showrooms.

Recent Developments in Local Undertakings.

We refer in a leading article in this issue to the optimism with which we look forward to the progress to be made in electrical operations in this country during the coming season, which is fostered by our observations of the electrical exhibitions which are in progress and of the enterprise which is being shown by some electrical undertakings in the development of permanent electrical show and demonstrating rooms.

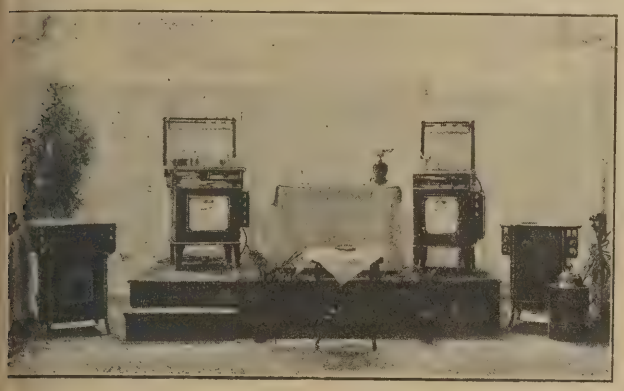

Fig. 1.—Demonstration Platform, Swansea.

We are able to give below some account of what is being done in the directions indicated in connection with some of the recent developments.

The electrical showroom of the past was a place where consumers or prospective consumers, if they happened to be near at hand, during the payment of the quarterly bill, for instance, could see how effectively and perhaps efficiently electric lighting could be introduced into the showroom. It is encouraging to see to-day showrooms which prove a real attraction to the public and a driving force in promoting the utilisation of electrical energy. The modern showroom or demonstrating theatre brings home to the consumer how effectively and economically electricity can be applied for its numerous uses in his home, office, works, &c. He receives valuable education and is inspired, by the interest and attractiveness of the place and by the courtesy and competency of the attendants, with a desire to impart his knowledge at the first opportunity to his friends.

The tendency prevailing is also to combine the showrooms and the demonstrating rooms, so that a demonstration can be given to a prospective purchaser at short notice while he is "on the spot" and his interest in the subject is at its height. Some of the modern showroom buildings are also far from lacking in fine external appearance and attraction, and to the Hackney and Swansea electricity undertakings our congratulations are due on their splendidly-designed premises.

The undertakers and promoters of the exhibitions and showrooms to which we refer below are to be congratulated on the results of their enterprise. Another encouraging point is the willingness of manufacturers to co-operate with the local undertakings by lending the necessary apparatus and equipment for exhibition and demonstration purposes.

The official opening of the North-East Coast Lighting Service Bureau, Dial House, Northumberland Street, Newcastle-on-Tyne, by the Lord Mayor of Newcastle, Councillor Walter Lee, J.P., on October 13th, was another event, the development of which we look forward to with interest.

The New Swansea Showrooms.

The new showrooms and offices of the Swansea Corporation Electricity Department, which were opened by the Mayor of Swansea on September 17th, *vide* Electrical Review, September 25th, are contained in a four-storey building situated in Oxford Street, a main thoroughfare of the town. The building contains some prominent features in structure and design, and some idea of its magnificent frontage can be gained from the view of the premises shown in fig. 2; the original photograph was, of course, taken after dark so that the results of the very effective flood lighting of the building are depicted. The showroom proper occupies the ground floor, and is provided with an imposing main entrance, double doors set well back being arranged centrally between spacious, well illuminated curved windows, forming an attractive porchway of considerable dimensions. In the interior of the showroom fittings and apparatus of every description are exhibited amid pleasing and decorating surroundings. A basement to the building, which was previously used as a restaurant, is now equipped as a lecture theatre, and it is suitably equipped for the purpose of giving demonstrations. It will accommodate between 150 and 200 persons. Fig. 1 shows a platform on which the demonstrations are given, and it will be noticed that ample room is given for cooking demonstrations. Since the inauguration of the showrooms several cookery demonstrations have been given, and the accommodating capacity of the basement has been severely taxed.

Several exhibits are arranged in various parts of the show and demonstration rooms, illustrating the uses and advantages of electricity for specific purposes. A fully furnished dining room is arranged with modern pendant and pedestal lighting. Another corner or portion of the premises is fitted out as an up-to-date bathroom equipped, of course, with an electrical geyser. Fig. 4, p. 632, shows a part of the premises set out as an "all-electric" kitchen. Another feature is the representation of a linendraper's showrooms illustrating the value of electric lighting in that direction.

Offices accommodating both the technical and clerical staffs are arranged on the three upper floors of the building.

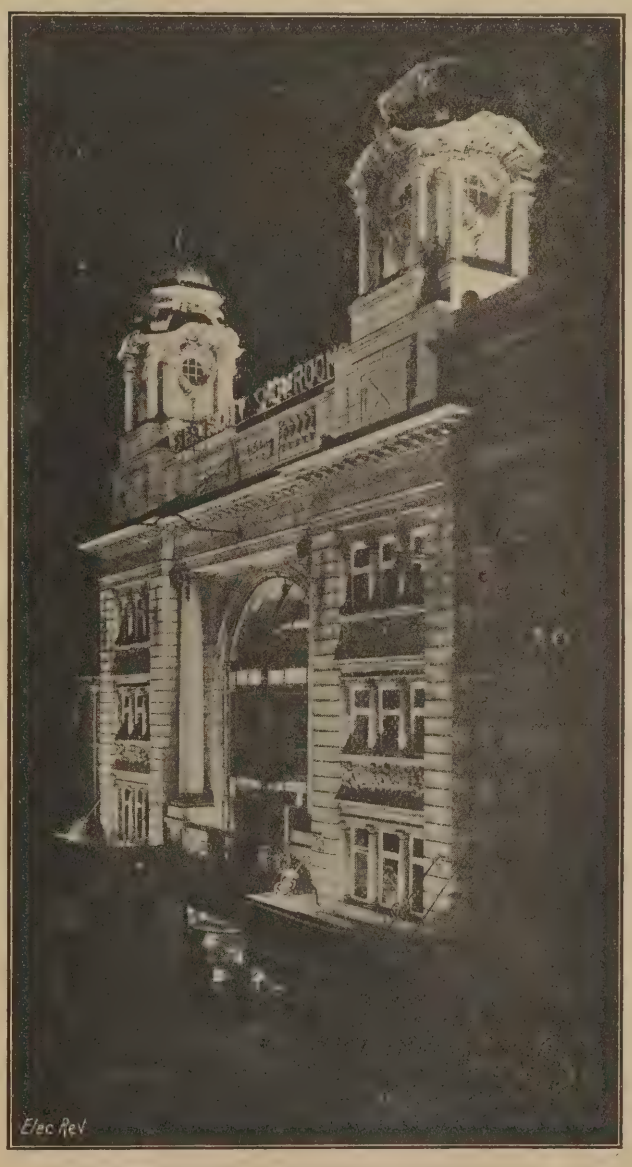

Fig. 2.—Exterior of the Swansea Premises.

The New Hackney Demonstration Halls.

Simultaneously with the inauguration of the new showrooms at Poplar, his Worship the Mayor of Hackney, Councillor E. J. Farmer, J.P., performed the opening ceremony of the new palatial demonstration halls and offices of the Hackney electricity undertaking at Lower Clapton Road, on October 8th. In the layout of these premises the principles for the promotion of the business interests of electricity suppliers and contractors have been borne in mind. The building consists of a central section rising to a height of 55 ft., with single windowed wing towers supporting it on each side. On the ground level a loggia extends the full length of the centre section, covering the two main show windows and the centrally placed main entrance leading to a large vestibule hall. To the right and left of the vestibule are two spacious showrooms where fittings of every description are effectively displayed. A demonstration hall which will accommodate comfortably 100 persons, is situated beyond the vestibule at a slightly lower level. Show-

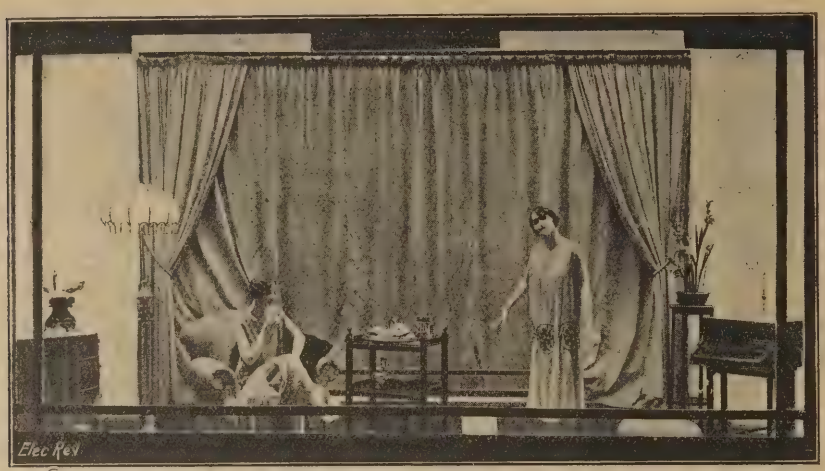

Fig. 3.—Hackney Display Window.

cases are arranged around this room and contain excellent displays and the necessary equipment for lecture and kinematograph demonstrations. By the side of this compartment are arranged a suite of model rooms where the actual demonstration of electrical appliances can be given in their normal surroundings, thus creating the desired atmosphere. One of these is a sitting room provided with all the latest home comforts, complete with a window and a garden scene: Another room is furnished and electrically fitted as a bedroom; while an electrically equipped kitchen and a bathroom similarly fitted up are included in the suite. A factory and workshop demonstration room is an important feature of the halls; this is designed

Fig. 4.—All-Electric Kitchen, Swansea.

for the suitable demonstration of workshop appliances. The building is one of four storeys. The first floor contains the offices, &c., the mains and meter departments are accommodated on the second floor and on the third floor is a suite of electrically equipped rooms provided for the caretaker.

Fig. 3 shows one of the display windows; it is equipped with the "Gecoray" system of lighting and includes a number of colour screens. The installation is connected up to a flasher and five-colour mixing effects are obtained. In addition, three flood lights are fitted with colour screens; these illuminated for a few moments make the sixth movement in the cycle of operations. Many manufacturers have given valuable assistance to the department in connection with the equipping and stocking of the premises.

At the King's Hall, Hackney Baths, where the inaugural speeches were made, there was an attendance of over 1,000 persons, including Mr. Joseph Richmond, who was chairman of the Borough Electricity Committee twenty years ago.

Councillor G. Green, the present chairman of the Committee, in his opening speech, said that the undertaking was now fourteen times bigger than it was twenty years ago. For 24 years the various electricity committees had been perfecting their methods of generation, making necessary extensions to the works, installing new machinery, and re-arranging tariffs to meet the needs and conditions of the area they served. To-day the undertaking was in the proud position of being first in its group of generating stations for fuel economy.

Councillor Davy (vice-chairman of the Electricity Committee) in handing the Mayor a special key of the new building, said that if the people of the Borough would visit the showrooms there would be no difficulty in converting them to the use of electricity.

The Mayor, in reply, said that electricity had revolutionised the means of transport, it had added very greatly to the efficiency of workshops and factories and it had added comfort to the homes of the people. He concluded with a tribute to the work of Mr. L. L. Robinson, the borough electrical engineer. At the conclusion of the proceedings a large number of visitors were conducted throughout the new building.

Additional Showrooms at Poplar.

The official opening of the new and additional showrooms and offices of the Poplar Electricity Department took place on Thursday of last week, when Mr. J. W. Beauchamp, director of the British Electrical Development Association, officiated. The inauguration was of particular interest in that it marked the twenty-fifth anniversary of the commencement of electricity supply in Poplar. The new premises, Electric House, 65-67, Bow Road, are situated on an important corner site opposite the Bow Road District Railway station. They form the third set of showrooms of the undertaking. In July, 1911, the first offices and showrooms of the undertaking were opened at 121, East India Dock Road, to improve the facilities for consumers and the development of service to prospective customers. Larger premises were taken and opened early in 1919 at 97-99, East India Dock Road, to accommodate the staff necessary to cope with the increased volume of business. The recent provision forms a new departure which is calculated to improve business facilities with consumers, particularly in the northern district of the borough, and to promote confidence with present and prospective consumers.

Forty feet of pavement separates the building line of the premises from the curb, and the frontage available for window display amounts to approximately 120 feet. Five floor levels

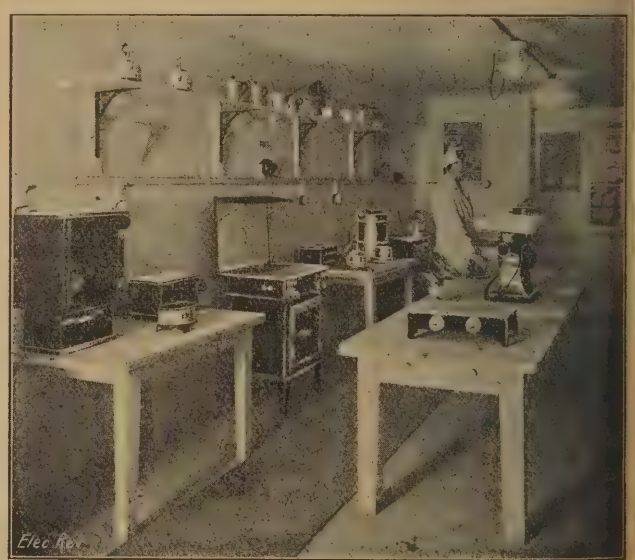

Fig. 5.—Demonstration Room, Poplar.

are included in the premises, excluding a basement, which is to be used for demonstration and lecture purposes; this has a seating capacity for 100 people. Fig. 5 shows some of the cooking equipment arranged for demonstrations in the basement. The ground floor constitutes the main show room, which is bordered on two sides by the display windows. Fig. 6 shows the main entrance and one of the windows. These are provided with modern systems of lighting, a special feature being the equipment of a special demonstration window in which incorrect and correct methods of illumination are depicted, fig. 6. Nine examples are shown and include lighting with coloured, flood and spot-light effects. Each method is automatically switched on in turn and an illuminated indicator board informs the observer as to the style of lighting in each case. A special feature of the demonstration compartment is the provision of cubicles in which the effects of various lighting fittings and

fires can be easily seen. Some of these cubicles are shown in fig. 7.

All types of fittings and apparatus are displayed, most of which have been provided by several of the manufacturers of this country for exhibitional purposes. Among the special items of interest is the bread-wrapping plant installed at the instance of Messrs. Young & Burton, Ltd., of Stratford. Sausage making by the Empire Provision Co. with "Hobart" and "Dayton" machines is also a feature, while an interesting exhibit is the "Little Marvel" potato peeler of Messrs. Mabbot and Co., Ltd. Great interest is shown in an exhibit of Mr. Herbert, of the Benjamin Electric Co., Ltd., which illustrates lighting devices from the "Aladdin" oil lamp to modern electric lighting. It is interesting to note that it is the intention of the undertaking to give demonstrations in the de-frosting of meat,

Fig. 6.—Poplar Show Windows and Entrance.

apart from bread baking, &c. Industrial exhibits such as electric cutting and grinding tools are given by Messrs. Wolf. All the usual domestic appliances are fully displayed and form an attractive feature. The general atmosphere of the showroom is enlivened by an electric piano kindly lent by Messrs. Keith Prowse, Ltd.

At the inauguration ceremony Mr. Beauchamp was introduced by the Mayor of the Borough, Councillor E. J. Lansbury, J.P. Mr. Beauchamp congratulated the undertaking on the position of "Electric House" and on its 25th anniversary of its commencement. He referred to the No. 2 station which was being built at Poplar, and said he looked forward to a further advance in that direction. He also alluded to the sympathy which the Electricity Commissioners showed towards the local development of electricity supply. He paid a tribute to the work done by Mr. J. H. Bowden, the general manager and chief engineer of the undertaking, and his staff. A vote of thanks to Mr. Beauchamp was proposed by Councillor W. Lyons, chairman of the Poplar Electricity Committee.

The Electrical Exhibition at Leicester.

The first "all electric" exhibition held at Leicester was opened in the Junior Training Halls on Thursday, October 8th, by the Mayor of the City (Councillor H. Simpson), and will be continued until Saturday, October 17th. Although the number of different firms which exhibited at the opening was satisfactory for an initial venture, the spacious halls were not well filled and the thirty-three participants could have had their number trebled without any overcrowding. There was a comprehensive display of electrical appliances, however, and some of the stands were of unusual interest. As might be expected, wireless goods were well to the fore, and were, indeed, the strongest feature of the display; and domestic appliances were also much in evidence. One of the largest stands was that of the Leicester Corporation Electricity Department, where were featured the entire range of domestic aids now offered by the undertaking to its consumers. It was an excellently arranged stand, calculated to do the maximum amount of educational work in the cause of domestic electricity. Another most interesting display was staged by Messrs. Gent & Co., of Faraday Works, Leicester. A conspicuous object of attraction was their "Pul-synetic" electric clock systems and time discipline apparatus, the clock, with its movement exposed, being studied with close attention by all visitors. The full range of the "Tangent" specialities of this firm were shown on a separate large stand. The Edison Swan Electric Company had an interesting show of domestic appliances as well as of accessories to meet office and factory needs. Messrs. F. J. Yates and Co., Leicester, specialised on electrical equipment for the manufacturer and merchant, and also had fitted up an all-electric bungalow which proved a centre of attraction and an eye-opener to the hundreds of ladies who inspected it. Messrs. Adcock & Shipley, machine tool manufacturers, Leicester, had an interesting display of electrical drilling machines, &c. An extensive range of electric fittings for all purposes was shown by Messrs. Brooks & Clayton, of Leicester. The Trent Electric Wireworks, Ltd., of Shardlow, Derby, staged a comprehensive outfit of wires and cables; and an exhibition of its storage batteries was given by the Ace Battery Company, Lutterworth.

Among the other firms which exhibited were the A.E.G. Machinery & Apparatus Company, recorders and other specialities; the Hendon Electric Lamp Co., Southampton Row, lamps and illuminated signs; G. W. Robinson, Great Windmill Street, London, lighting fittings, time switches and other devices; "Sadias" Ely Place, London, the "Zent" electric thermo-storage boiler; the Electric Heating and Hardware Co., of Birmingham; the General Electric Co., Ltd., domestic accessories; Belling & Co., Upper Edmonton, electric fires; Heatley and Co., Leadenhall Street, the Alcock electric defroster; the British Electric Transformer Co., London, electric cookers and fires. A notable feature of the exhibition was the activity of the Electrical Association for Women, which illustrated the progress made in lighting by electricity with working models of the various types and systems of electric lamps and installations, &c.; demonstrations were also given in how to avoid glare; and the correct utilisation of electricity in industry.

During the week a series of lectures on the use of electricity in the home was arranged by Miss Margaret Partridge, B.Sc., and the B.B.C. provided entertainment in the shape of concerts on the "wireless."

At the opening ceremony the Chairman of the Leicester Electricity Committee (Councillor A. H. Swain) presided, supported by the Mayor and the Mayoress (Mrs. Simpson); Mrs. A. H. Swain, Alderman G. Banton (Chairman of the Tramways Committee), Alderman H. Hand, Miss Clara Haslett (Director of the Electrical Association for Women), and a number of other ladies and gentlemen, including Mr. T. P. Bentley, the promoter of the Exhibition, were also present.

Councillor Swain briefly introduced the subject of exhibi-

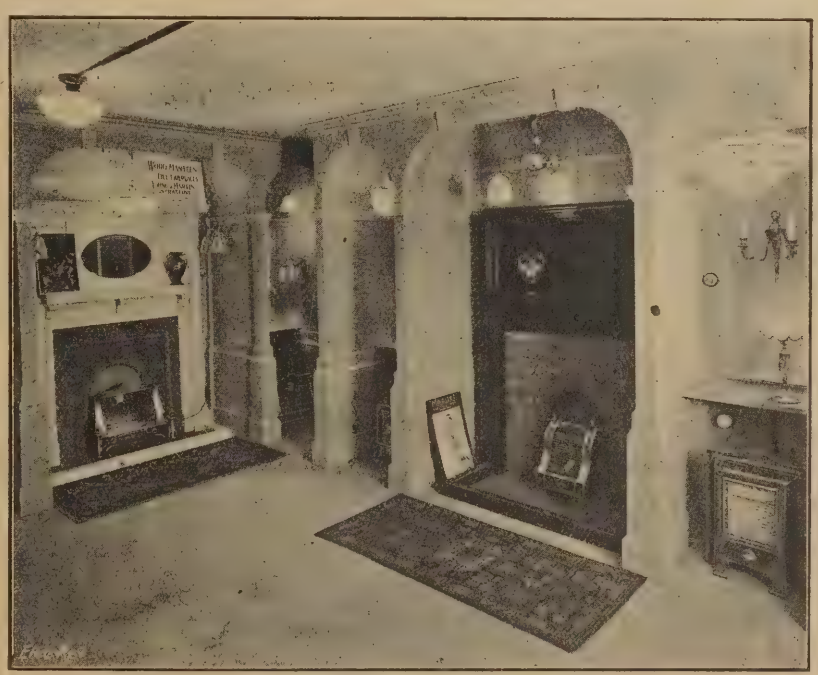

Fig. 7.—Demonstration Cubicles, Poplar.

tions, and commended the project in Leicester, as he claimed that electrical development would go far to relieve the country of its industrial problems.

The Mayor, in declaring the exhibition open, said it was advertising a not inconsiderable local industry, and that was a benefit to the city. The City Council was greatly interested in the exhibition, as it believed that electricity in the home would go far to ease the burden on the housewife and thus greatly promote health.

Miss Haslett, in seconding a vote of thanks to the Mayor proposed by Councillor Acton, congratulated Leicester on its progress electrically, and said she had noticed that electrical appliances were placed within the reach of the poorest people, while she had the authority of the Home Office for stating that the city occupied a high place for the use of electricity in

factories. The immediate need was to educate women as to the advantages of electricity in the home.

Alderman Banton, who supported, expressed his belief that it was to the use of electricity they must look for the suppression of the smoke nuisance.

The Nottingham Electrical Exhibition.

Following quickly upon the opening of the city's new electricity generating station, an opportunity is being afforded at Nottingham of witnessing an electrical exhibition of great variety and interest, embodying appliances of the latest types for lighting, cooking, heating and power purpcses. The display which was opened by the Mayor (Mr. J. Clarkson) on Thursday of last week, and, like the Leicester exhibition, is to be continued until to-morrow, has been arranged in the Drill Hall, Derby Road, an admirably adapted building, responsibility for the project devolving upon the local branch of the Electrical Contractors' Association, members of which have received the support of the Corporation Electrical Department. It is in view of a possible early reduction locally in the price of energy, that the exhibition derives additional interest as affording a ready means whereby prospective, as well as present, consumers of the Corporation may realise the value of adjuncts now available. The municipal electricity committee has afforded a generous measure of assistance to the venture, providing gratuitously all the energy needed and connecting up each stall free of cost. Besides its own exhibit, which is of considerable technical interest, it has undertaken the distribution of a great deal of instructive literature, bearing upon the subject of electricity supply for domestic and other purposes. It was a happy thought which led to the Corporation's participation in the display taking the form of a delicately furnished bungalow in which varied devices have been exemplified to the most skilful advantage, the municipal committee having contributed substantially to the success of the project generally by making itself responsible for an expenditure approximating £1,000. Among the largest of the exhibitors are Messrs. Henry Barker and Co., of Angel Row, Nottingham, who make a most varied display, beside having been responsible for most of the attractive decorative work in connection with the Corporation bungalow. The Edison Swan Electric Company has, through its local branch, provided a stand replete with interest, among the labour-saving appliances there brought under notice being the "All British Little Glutton" suction cleaner, presenting many valuable features. Ediswan fires are also being shown, together with alabaster bowls and electric vases, the whole presenting a very artistic effect.

Among the principal exhibitors is a well-known local firm. Messrs. Pearson Bros., of Long Row, who make an extensive display of domestic apparatus, including, prominently, products of the Western Electric Company. Among these are washing and ironing machines, in which the facilities for effective work are strikingly demonstrated. Amplifying their show of wireless apparatus, Messrs. Attenborough & Turpin, of Goldsmith Street, Nottingham, have afforded the opportunity for the inspection of a Wolseley electric generating plant, of a size commensurate with the requirements of a large house which may not be able to obtain a public supply of electricity. Their stand also, which is typical of several others, includes a great variety of labour-saving domestic appliances. Articles for the manufacture of which the General Electric Co., Ltd., is responsible are to be found upon most of the stalls. One of the most interesting stands in the exhibition is that of Messrs. J. & S. Farr, Ltd., a well-known Nottingham firm, who show a wide range of electrical appliances. Messrs. Thomas Danks and Co., of Nottingham, have also contributed substantially to the success of the exhibition, one of their specialities being electrical apparatus for water heating. The British Thomson-Houston Co. also make a comprehensive contribution. The wireless side of the exhibition is of great variety and interest, a notable feature being the cheapness of many of the sets. Keen interest has been manifested in relation to the display which has attracted large numbers of visitors, including many from surrounding districts, and has admirably fulfilled the municipal purpose of exemplifying the value of electricity for all its varied purposes. Incidentally, following upon the opening of the new power station, it has served also to stimulate considerably the demand for electrical energy, it being altogether encouraging from the municipal point of view to know that the department has been lately inundated with applications from those who are desirous of obtaining supplies.

Of particular interest on the opening day were successful tests made by Mr. L. H. Pearson, a local inventor, whereby electric current was controlled by speech. Mr. Pearson claims to have perfected a device which makes it possible to command electric light to switch on and off by word of mouth. Briefly, the device transforms sound waves in such a manner that they will control any electrical circuit. He startled the onlookers by starting up a motor merely by the sound of his voice. Mr. Pearson hopes to adapt the invention to surgery, so that patients' heart-beats could be recorded at some distance away.

The Scottish Lighting Service Bureau.

The Scottish Electric Lighting Service Bureau at 20, Trongate, Glasgow, an offshoot of a similar bureau in London, and the first of its kind in Scotland, was formally declared open on Monday by the Lord Provost in the presence of a large gathering of those interested in electric lighting. The bureau, which is conducted by Mr. Henry E. Hughes, district engineer, has as its prime object the educating of the public in the modern principles of electric lighting, and a commodious demonstration room, in which numerous electric fittings are installed, will be used to show the correct and incorrect methods of lighting in the home, shop, and factory, and also on the street. The elimination of "glare" is one of the principal features of the demonstrations. Particularly interesting is the display of shop window lighting, showing the attractive powers of spot and flood lights, while there are also displays of illuminated sign and poster lighting. In a central lecture room contrasts will be shown in shop interior and street lighting, while house lighting methods are demonstrated in an apartment fitted up as a sitting room. Lectures open to the public will be given each day by Mr. Hughes as well as by experts from London. Many Scottish electrical bodies, including the Glasgow Corporation lighting and electricity departments, are interested in the work of the Bureau, which has been established purely for educational purposes.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Automatic Motor Acceleration Device.

The Metropolitan-Vickers Electrical Co., Ltd., Trafford Park, Manchester, has produced an automatic accelerating device for use with liquid controllers applied to motors driving

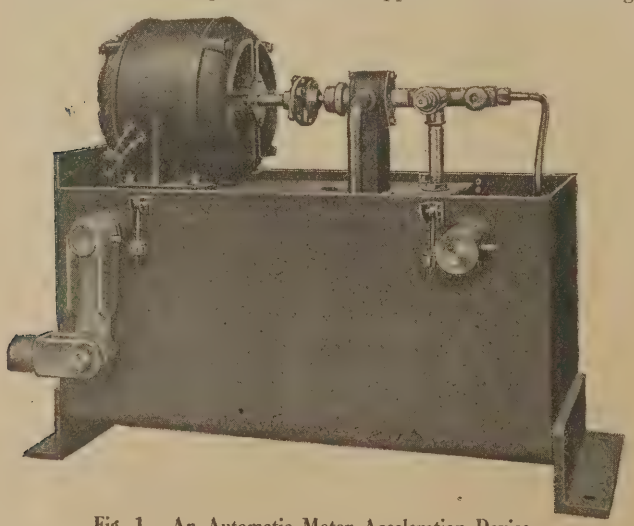

Fig. 1.—An Automatic Motor Acceleration Device.

electric winders, haulages, and the like. By means of this apparatus the maximum safe rate of acceleration can be obtained automatically, thus securing maximum economy. The device prevents too-rapid acceleration and ensures that when the operating lever is pushed from zero to the full-speed position, the motor attains full speed in the time for which the apparatus is set. But whilst preventing too rapid acceleration, and giving automatic attainment of the correct economic speed, full power is retained to run at any lower speed that may be desired, or to obtain inching for decking purposes.

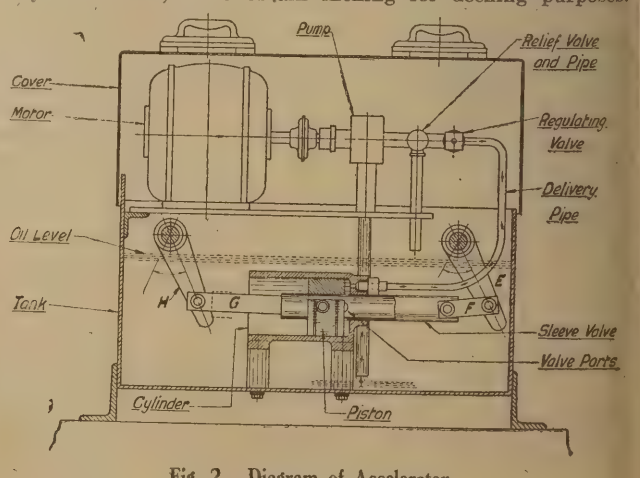

Fig. 2.—Diagram of Accelerator.

Should a different time setting be required, the process of effecting this is a very simple one. Moreover, an easy adjustment is provided whereby the automatic action may be dis-

connected and full manual control restored should this ever be necessary. The device is illustrated in fig. 1, while fig. 2 is a diagram showing the method of operation. Referring to fig. 2, the principal parts are a steel tube forming a simple sleeve valve connected with the operating lever through links E and F; a piston connected with the controller through links G and H and an external link; and a motor driving a pump which circulates oil (at uniform pressure to ensure uniform acceleration) through a delivery pipe fitted with relief and regulating valves. When in the position shown, oil drawn from the bottom of the tank and pumped into the cylinder, escapes through four port holes in the sleeve valve. Directly the sleeve valve is moved into the full speed or any intermediate position, the piston is forced by oil-pressure to follow the valve until the port holes are again sufficiently uncovered to allow the oil to escape. The rate at which the piston moves forward, and consequently the time taken for automatic operation of the controller is determined by adjustment of the regulating valve. In deceleration, the sleeve valve is moved back in unison with the operating lever, and the immediate return of the piston is arranged for by having the moving parts of the controller biased by means of weights so that there is a force tending always to push the piston to the back of the cylinder. To avoid any possibility of jarring, spring buffers are fitted. When installing the apparatus, the regulating valve must be set so that the controller is moved from its off to its full on position in the number of seconds given on the performance diagram, after which no further adjustment is required.

An Electric Organ-blowing Equipment.

The accompanying illustration is of a new type of single stage electric organ-blowing equipment that has recently been developed by the Rockingham Engineering Co., Beulah Road, Thornton Heath, Surrey, specially designed to meet the requirements of instruments having low and medium pressures, and where an effective and inexpensive type of blowing apparatus is desired. The blower is built up with cast-iron diaphragms and sheet steel castings. The fan or impeller is mounted on the electric-motor shaft and the blower and motor are arranged on a combined steel bedplate as shown, making a solid engineering job of compact construction. The impeller is designed to secure the highest efficiency in operation and is proportioned according to the output of volume and wind required. Three forms of construction can

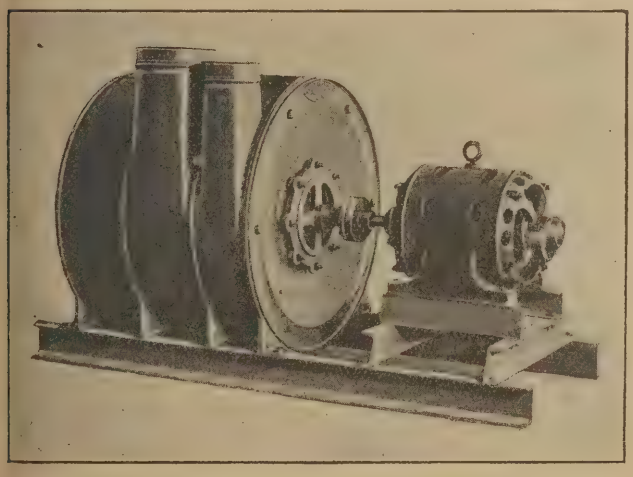

Fig. 3.—Electrical Organ-Blowing Equipment.

be employed according to requirements, one with an open intake on the motor side; one with an internal intake chamber and a non-return valve; and one with a piped intake so that the air may be drawn from another source, this being specially desirable where the apparatus is placed in a heating chamber and avoiding the use of hot air laden with dust and sulphurous fumes. From the outlet of the blower (which can be arranged vertically or horizontally), the wind trunk is run to the main organ reservoir, where the control valve is fixed, automatically regulating the supply of wind according to the demands of the player. The electric motor runs at normal speed while in use (the apparatus being controlled on the wind side only), but owing to the particular construction of the blower portion, the load on the motor varies with the wind output actually taken. For large organ blowing installations and instruments in which higher wind pressures are employed, the muti-stage type of blower is adopted (fig. 3) from which wind at varying pressures may be taken by separate wind trunks. For still higher pressures an independent booster is used to deal with a portion of the wind required, this booster being belt driven or direct coupled to the main motor and blower.

It is interesting to note that the magnificent organ at the Liverpool Town Hall, originally blown by two steam engines, has been equipped with an electric blowing installation by the Rockingham Engineering Co. This plant consists of a 15-h.p. three-phase motor, running at 1,440 r.p.m. direct coupled to the main blower, which has a capacity of 3,500 cubic ft. of air per min. This blowing plant is placed in the basement of the building and controlled by a push button at the organ keyboard working in conjunction with an automatic contactor panel in the blowing chamber.

Smoke Abatement.

A Conference at Buxton.

The annual conference of the Smoke Abatement League of Great Britain was held this year at the Palace Hotel, Buxton, from October 2nd to October 5th. It will be recollected that in November, 1924, a lengthy conference combined with an exhibition was held in Manchester. Since that time many lessons have been learnt, chief amongst which is the fact that the reading of lengthy papers, however admirably prepared, is not conducive to action in the great problem of educating public opinion. Again, by holding the conference in the form of a "Smoke Week-end" in a quiet place, it was thought that further headway would be made. It would appear certain even at this early date that the action of the Executive has been more than justified, and the Buxton Conference will no doubt be regarded as the most successful in the history of the League In the words of Dr. R. Veitch Clark, the Medical Officer of Health for the City of Manchester, "it is evident that the movement is being reborn."

The League is extremely grateful to those members of the electrical profession who from time to time have rendered to it valuable assistance, but it was unfortunate that amongst those assembled at Buxton there were very few representatives of the industry. To the most casual observer it must have been apparent how useful the presence of a few electrical experts and commercial heads would have been. It is to be hoped that in future years the industry will take an even larger part than it has done in the past, as, after all, the final solution of the problems will rest to a very large extent with it.

After the hotel dinner on the Friday night an informal meeting was held under the chairmanship of Dr. F. Ashworth (Medical Officer of Health for Rochdale), who has done much towards the solution of the problem of smoke abatement under the exceptionally difficult conditions obtaining in his town. At this meeting the hon. secretary (Mr. C. Elliott) gave an account of the main objectives of the League. He explained that the main line of all its actions must be the education of public opinion, and as a central point in this the League advocated the setting-up of independent advisory bureaux and showrooms for the dissemination of the knowledge of the principles of heating and ventilating.

The annual meeting of the League was somewhat protracted and many important details were discussed. Two of the points, however, require emphasis; one was the desire of the Executive to remove any feeling that the League was a "Manchester" affair, and the second was the question of the establishment of branches. During the course of the meeting it transpired that another conference was likely to be held in Glasgow early in 1926, and, as is now well-known, the Bingley Hall at Birmingham has been reserved for an exhibition in September, 1926. The election of the General Council was a matter over which great care was taken, the meeting being adjourned to give further time for discussion. Amongst those re-elected was Ald. W. Walker, of Manchester. A number of gentlemen who were unable to devote the necessary time were replaced, and an active and strong council is now in readiness to deal with the important constructive programme unanimously endorsed by the conference.

The chair was taken by Coun. J. H. Robson, of Huddersfield, and short papers were read by Mr. R. H. Clayton, B.Sc., and Miss M. Fitzgerald, A.R.S.I. The meeting was devoted to the study of the best methods of educating public opinion. Coun. Robson, after a brief reference to the absence of smoke during the coal strike of 1921 and also at such Continental towns as Barmen, Elberfeld, &c., emphasised the importance of teaching the public actual facts, not merely through the ear but through the eye as well.

Mr. R. H. Clayton commenced with a vigorous denial of the accusations made against the owners of power plants for making black smoke. Not more than 5 per cent. of the industrial chimneys of Manchester emitted serious quantities of smoke, he proceeded, and other towns should follow suit. It was the domestic fire which formed the greatest difficulty. In spite of the efforts of the gas and electricity departments of the various Corporations a glance on each side of the railway passing along from Stockport into London Road (Manchester) would satisfy anyone as to where the trouble laid. Too little attention was paid to the cost of smoke, estimated so far as Manchester was concerned at about £1 per head of the population. This point should be continually pressed on the public. It was not appreciated so much by the rich, said Mr. Clayton, as by the poor. The rich man got away from the smoke as soon as his work was done, but he forgot to calculate the cost not only of time and money spent in travelling, but also the serious situation which arose by the alienation of the master from his employés. This was a point worthy of consideration even apart from the effect of smoke upon the health of the worker and consequently upon his output. Public bodies relied on the gas and electricity departments or on the medical officer of health. This was not the right way. The question of air pollution should be dealt with on the same lines as those on which the purification of rivers had been attended to. In the latter case, the public had no objection to money being spent with only a distant hope of a monetary return. Air purification, on the other hand, had the certainty of an immediate profitable return. He advocated the setting up of independent fuel heating and ventilating departments. Ventilation was most important and could not be divorced from heating. "Smoke areas" should be arranged on the lines of those "regions"

already set up around the large towns, and a sum of £10,000 per annum allotted to each heating and ventilating department. On the ten million people around Manchester this would involve a very small rate. The department would be under the Sanitary Committee without bias from the gas or electricity departments. Practical study, work and experiments (with the co-operation of ladies) would be carried on. In a word, "Public Education." All reforms, said Mr. Clayton, came from the people, and to attain them, practical demonstration, not lectures, was required.

Miss Marion Fitzgerald then put forward her views on the best methods of educating public opinion, and in a short practical address she pointed out that first of all the object must be to convince the housewife that the evils need not be tolerated, and then to show her how they could be avoided. The chief arguments to use were health, civic benefit, and, above all, the now popular labour-saving devices. The League should associate itself with all civic and social societies working for the betterment of the conditions of the people. The Association was grateful to the Press for its assistance in the past. The domestic science teacher should be approached through the Boards of Education. What the people required was real information, not counsels of perfection. She would give her full support to the independent department alluded to by Mr. Clayton and urged the League to do so.

Mr. H. G. Clinch, the chief inspector of the Halifax Health Department, in the course of a short speech after the discussion had commenced, alluded to the fact that in his town they were well backed up by the gas and electricity departments.

Mr. J. Munro, of the Health Department, Glasgow, gave some details of the excellent work carried on in that city, and said that the Air Purification Committee was "sub" to the Health Committee.

Dr. Barlow (Medical Officer, Wallasey) alluded to the fact that local authorities had now legal powers to spend money on propaganda work in this connection.

Mr. S. H. Moore, Chief Sanitary Inspector of Chester, held that the new department should not be separate but should be under the control of the medical officer of health.

Dr. R. Veitch Clark (Medical Officer, Manchester) said that the medical officer who thought he could deal with the smoke question without outside aid was a fool. He required the full weight of public opinion. The Smoke Abatement League should be put into such a financial position as would enable it to send lecturers all over the country. It was not a problem of single authorities but of large "Smoke Areas."

(To be concluded.)

The Electrical Import and Export Trade of Austria.

Progress of Exports.

The following table gives particulars of Austria's imports and exports of electrical machinery and apparatus in 1923 and 1924, the total values in gold crowns being stated, together with the total weights in quintals and the weights by countries of origin and destination. The steady progress which has been made in almost every branch of Austria's export trade in electrical goods, which is carried on chiefly with neighbouring countries, is clear testimony to the recovery that has taken place in Central Europe.

The Consumption of Electricity in Relation to Population.

By J. W. BURR.

(*Abstract of Chairman's Address: Western Centre of the* Institution of Electrical Engineers.)

We are told that in 1922-1923 some eighty per cent. of the undertakings in Great Britain had not reached a stage of development corresponding to a sale of one hundred kWh per annum per head of the population and that sales of three hundred kWh, or over, per annum per head of population had been attained in a few cases only. The Electricity Commissioners also state in a review of their return of statistics of electricity undertakings, that on the basis of the Census of 1921, the aggregate population of the areas of supply of the local authority undertakings included in the return was approximately 22.8 millions, thus denoting an average sale in 1922-1923 of about 98 kWh per head of the population in such areas. The corresponding average figure for the supply companies' areas is not given, but we may assume that it does not differ from the above figure to any appreciable extent. Compare these figures with those given by Continental engineers, at the World's Power Conference. In Norway the estimated annual consumption per head of population was 2,000 kWh. I am quite aware that these figures apply to hydro-electric stations; all the same I see no reason why the difference should be so great. It would appear that we have barely touched the fringe of the domestic load in this country and it is certainly up to we engineers to find out the reason.

Do we realise that domestic consumers can easily become the greatest and most important of all users? We must be prepared to give the consumers what they want and not what we think they ought to have; educational publicity is in my opinion necessary, together with enthusiasm. We must be enthusiastic and after all we have reason to be; we must, of course, temper our enthusiasm by scientific knowledge.

"Is electricity available to all who require it?" The answer is decidedly in the negative. Many people could not at present have a supply of electricity, whatever their wishes might be, simply because the cost of running mains or transmission lines is so high. If a supply is to be available in the rural districts the Government should be asked to increase the grant or the cost of the work must be reduced in some way or other. This can only be done by co-operation with the cable, transformer and switch manufacturers, and I believe that great reduction in prices can be made if they will only take the matter in hand. Further, I would point out to manufacturers that this is a problem for them to solve and not for the supply authorities, as the cost of generation does not enter into the matter to any great extent. In regard to legislation, I am decidedly of the opinion that the Electricity Supply Acts restrict real expansion and attempts should be made to remove many of the restrictions which not only hamper the industry, but are in my view unnecessary.

Have we a suitable tariff for domestic apparatus and, if not, is it possible to obtain one? Tariffs vary in different parts of the country but, generally speaking, they can be grouped under two heads; the "flat rate" system, and the "two part" system of charging. It would appear that no tariff obtains to-day in this country such as to induce the domestic consumers to use electricity for all purposes, and it may, of course, be partly due to the cost of the apparatus.

Our generating costs are made up of the two factors: Annual charges on capital expended; and running costs. It necessarily follows that this fact will increase the total cost of generation. I suggest that as soon as a new station could show a saving on the cost of supply to the consumer equal to the annual capital charges on the old station, the latter should be shut down forthwith, as by that time it has outlived its usefulness. I do not think that any interest, municipal or company, should be allowed to stand in the way of this being done. In my view the Electricity Commissioners should have compulsory power in this respect, and their decision should be absolutely final.

When I referred to the erection of new stations I was not talking of super-stations but of medium-sized generating stations with modern plant situated about 20 or 30 miles apart, the exact distance depending upon the electrical density of the area. These stations should be suitably interconnected, provided the generating stations are not too far apart, as not only would the expenditure on generating plant be reduced thereby, but it would also improve the load factor and reduce operating costs. It would further secure continuity of supply to a great extent.

In regard to the much talked of super power station and its possibilities of reducing generating costs, I have always held the view that while the thermal efficiency of a medium-sized station, *i.e.*, one with a plant capacity between 25,000 and 50,000 kW, might be less than the thermal efficiency of a modern super power station equipped with all the heat saving appliances, it may easily be that the actual cost per kWh sold will be actually higher with the more efficient plant. It may also be that the larger station has to distribute electricity over a wider area and as a result will have to bear higher capital charges for main and transmission lines and also higher C^2R losses. It is possible for these conditions to neutralise the difference in the thermal efficiency between the two stations. I am assuming that the super power station is striving for the highest thermal efficiency and that its plant would probably consist of boilers suitable for a working pressure of between 350 and 500 lb. per sq. in. and a total steam temperature between 700 and 750 deg. F.; of air heaters instead of water economiser; of water heaters for raising the temperature of the condensate on its way to the boilers, fed with exhaust steam and steam bled from the turbine at various stages. The turbine units would be as large in capacity as possible and run at the highest speed to conserve space. With all the heat-saving apparatus and best modern plant obtainable, it is not possible for any super station to obtain an operating thermal efficiency of more than 25 per cent.

Briefly, then, I consider a medium sized station, well equipped with modern plant of the ordinary type, well situated in regard to the electrical centre of gravity and the supplies of coal and water, can supply consumers as cheaply as any super station distributing over wide areas. I would also say that in my opinion, the storage of large quantities of coal, the removal of ashes and the provision of a plentiful supply of cooling water, are problems it is often difficult to solve. In regard to generating stations generally, it is interesting to note that the maximum thermal efficiency of the most modern station erected was slightly under twenty per cent.

As much attention should be paid to the possibility of reducing distribution costs as to that of reducing generating costs. Cannot some method be devised for putting cable underground without disturbing the surface of the roadway? Thrust boring has been tried with a small measure of success. The present boring plant, however, is not suitable for all subsoils and reliable information in regard to the nature of the sub-soil and obstructions is not always obtainable. The idea, however, is good and needs developing. Co-operation is required between the Post Office, Electrical, Water and Gas Departments, so that in the event of one department opening up, the others could take advantage of the excavation, if required. When a roadway is made up or relaid it will probably pay to lay ducts on both sides of it, even although the prospective demand in the district does not justify the laying of a main at that particular time.

Every effort should be made to reduce the annual capital charges on the distribution system, not by "skimping" the copper (this may be false economy), but by reducing the cost of laying as much as possible. The running costs should also be reduced to a minimum.

I do not think it is generally realised what difference it makes in the works costs if the staff and men all work together instead of against each other. While I have no wish to "scratch the back" of the workmen, I would say that if more time was spent in trying to get the employés interested in their work and pulling together, than in reducing wages, I think it would be better for the undertaking generally.

Having produced our energy at the lowest possible cost, we must see that it is sold at a price which will give a reasonable return on the capital expenditure involved. In my view any profit should be returned to the consumer in the form of a reduction in the price of electricity, and a loss would have to be met by an increase in the price.

The tariff which obtains mostly on the Continent is, I believe, one in which the charge is the same irrespective of the use to which the energy is put. It is so much per kW year. If, therefore, a consumer pays for 1 kW year he may consume 8,760 kWh for any purpose he likes. The simplicity of the charge would appeal to the consumer, and the exit of the integrating meter would appeal to the engineer.

In order to completely solve our problem we must deal with the wiring and equipping for all domestic purposes.

I estimate that at present the cost of suitably wiring and fully equipping a villa residence of any seven rooms for all purposes, at £115. I believe that by mass production this price could be reduced enormously. If the undertakers are prepared to take a risk by offering a suitable low "all-in" tariff to all consumers proposing to use electricity for all purposes, I think the manufacturers should also be prepared to take a risk in the way of producing electrical apparatus in mass at a low price and chance the market.

New Electric Fires.

Designs for the Coming Season.

(*Concluded from page 594.*)

F. Turner & Co.

The employment of an electric fire in the place of a coal fire often means the leaving of an ugly gap which the fire is unable to fill. A number of firms which manufacture fires also produce a means of closing up this space. An example of this work is illustrated in fig. 27. This is an art metal surround of handsome though plain appearance made by Mr. F. Turner, Birmingham. It is adjustable and can be fitted in fireplaces measuring from 24 to 42 in. in width. It is made in brass or copper, or with an oxidised silver finish.

Inventum Electrical Appliances.

The principle feature of the fires of this make is the "plug in" elements. This arrangement renders the replacement of elements as simple a matter as the changing of an electric lamp. It is claimed that the elements are scientifically focused along the focal line of the parabolic reflectors. A very cheery appearance is given by these fires when in use. Fig. 30 is a wall design of fire which is supplied in either black, satin brass or florentine bronze. It is fitted with brass reflectors and the elements are designed for either 500 or 750 W loading.

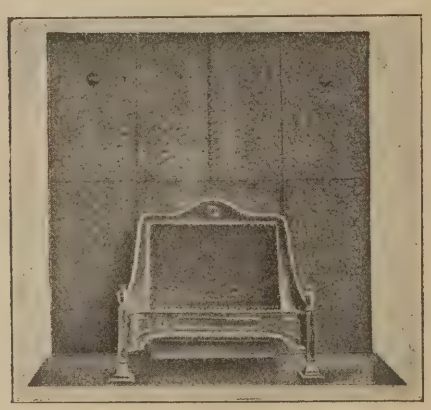

Fig. 27.—An Art Metal Fire Surround.

Fig. 28.—Reflecting Well Fire.

Fig. 29.—Bowl Reflector Fire.

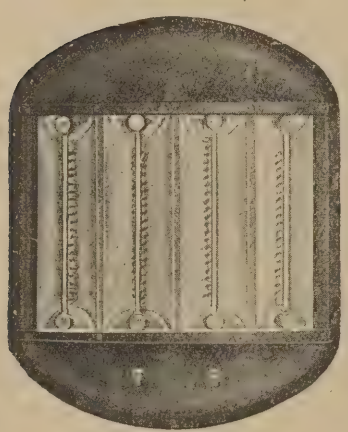

Fig. 30.—Wall Fire.

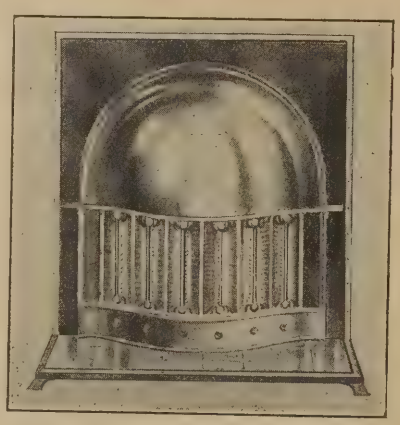

Fig. 31.—Fire with Tiled Hearth.

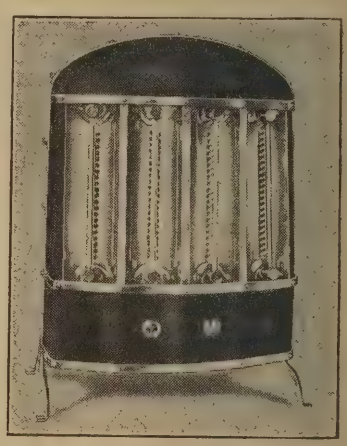

Fig. 32.—Sheet Metal Fire.

Fig. 31 is a new design depicting the hand made fire with a screen covering the aperture above the elements as provided in an ordinary coal fireplace. The screens are made to measure. These fires are supplied with detachable tiled hearths of any colour for decoration purposes. The elements are supplied in standard sizes for 500 W and 750 W loading.

Fig. 32 is of a particularly effective design finished in crystallised black with nickel relief. Each plug-in element is provided with a separate parabolic nickel reflector. As in the other designs the elements are made in two sizes for 500- and 750-W loading.

Wm. Geipel & Co.

The "Quead Junior," model Q 20, fig. 29, and the "Queen," model Q 21, fig. 28, are two attractive designs which this company has placed on the market. In the former the bowl reflector, which is of the usual design, is hinged to the pedestal so that it will tilt and lock firmly at any angle. The reflector is made of stout solid copper of excellent finish and the pedestal is of cast iron with a black enamel finish. The element is readily adjusted, and is made in three standards, for pressures of 100/120 V, 220/220 V, and 240/250 V. Its loading is 600 W. A strong and neat guard of copper finish is designed to accommodate a kettle when the bowl is tilted to a horizontal position. The latter is an attractive design of reflecting well fire. The reflector is of the usual copper finish, and is fitted with cast aluminium sides of artistic design. The element is of the usual "Quead" patented type. The consumption is 1,000 W ordinarily, or 2,000 W with a snap switch. It is made in standard sizes for pressures up to 250 V. A heavy coppered finish guard is provided.

A New Electrical Process for the Manufacture of Steel.

By HENNING FLODIN.

(*Abstract of a Paper read before the* IRON AND STEEL INSTITUTE.)

THE paper deals with a series of experiments in the direct smelting of ore by electrical means, carried out by the Electro-Chemical Section of the Royal Technical High School at Stockholm during the years 1923-25. The object of the trials was to ascertain whether malleable iron and steel could be extracted direct and continuously from iron ore, and at the same time to reduce the percentage of phosphorus and sulphur content in the ore and coal. An electric furnace was specially constructed for the purpose, working with a load of about 30 kW. A few trials alone sufficed to establish that iron with 0.02 per cent. carbon and upwards could be produced without difficulty. Sixty-five such trial reductions were made in a furnace of the particular construction mentioned, the results of which fully bore out that the method pursued was on the right lines.

The effects were so encouraging that it was decided to test the process thoroughly on a reasonably large industrial scale at the ironworks at Hagfors, Sweden. An electric furnace with a load of 250 to 300 kW was used, and up to the time of writing 114 tappings had been made. It was found that there was no difficulty whatever in producing iron and steel of any desired carbon percentage at successive tappings without interruption of the process, showing that the process could be controlled in the same manner and quite as easily as the discontinuous open-hearth process. The manganese and silicon contents are controlled in the same manner as in the open-hearth process. From the heat No. 3, containing 0.78 per cent. carbon, an ingot was taken and rolled out at the Forsbacka Ironworks, Sweden, and the material was used for making chisels for pneumatic hammers, drills, and miners' sledges, mainly for the purpose of testing the material. The chisels have proved to be fully equal to those made of the firm's own Bessemer steel, and a drill penetrated 0.4 metre into granite in a wet borehole without regrinding. The total radiation surface of the experimental furnace was 30 square meters, and when running empty the consumption was about 100 kW. At a load of 300 kW the furnace was therefore working with 200 effective kW.

A 3,000-kW furnace would have a radiation surface 2.33 times larger than the experimental furnace, or 70 square metres, so that the heat loss in this case would be 2.33×100=233 kW. The effective load would therefore be 3,000−233=2,767 kW. The losses due to water-cooling in the moulds, in contact rings and refrigeration, &c., would amount to 263 kW, making the total loss 500 kW.

The loss on energy at a load of 300 kW in the experimental furnace was 33.3 per cent., and in the 3,000-kW furnace it would be 16.65 per cent. At a load of 300 kW 1 ton of iron was produced in the experimental furnace, with an expenditure of 2,700 kWh; deducting 100 kWh for empty running, the production thus amounted to 111 kilogrammes per hour. If the 3,000-kW furnace worked with a net amount of 2,500 kW (3,000 less 500 kW loss), the production would therefore be:—

2,500 kWh×111 kg. per hour/200 kWh=1,388 kg. per hour. The gross expenditure of energy in the furnace would thus be:—

3,000/1.388=2,162 kWh per ton of iron.

The heat content of the waste gases would amount to between 2,700 and 2,900 calories.

The process works direct on a mixture of ore and coal in a single furnace, and the product is in the form of malleable iron and steel capable of being teemed into chills or other moulds in the usual manner. The process, however, does not only work direct as "one single process," but is continuous, interruptions occurring only at the moments of tapping, when the continuous feeding in of the mixture of ore and coal ceases, to recommence immediately after the tapping is complete. The operations must, of course, be carried out in such a manner that the furnace is fed with the mixture of coal and ore in quantities corresponding to the capacity of the amount of electrical energy supplied for reduction and fusion.

The reduction of the iron proceeds uninterruptedly and continuously. The metallic iron particles reduced from the ore may be compared to a fine rain continually dropping through the slag bath to the bottom of the furnace, where the molten malleable iron constantly accumulates. Practically speaking, the iron is in a fit condition at any moment for tapping in varying quantities in proportion to the rate of reduction, and it is hardly to be imagined that a higher degree of continuity can be reached in any process for the production of iron.

The raw materials used at Hagfors in the experimental furnace were Swedish hæmatite ore, and both English pit coal and Swedish charcoal. No refinement in special furnaces is necessary for the removal of phosphorus and sulphur to a sufficiently low point, the process being based on the principle that in the reaction the molecules are in contact, thus facilitating the transfer of the phosphorus and sulphur to the slag. A specially low-carbon material produced by the "one single process" may perhaps meet certain requirements for electric and magnetic purposes, and the product is generally suitable for any purpose where an extremely low percentage of carbon in the iron is desired. After the thorough tests to which both the iron and steel materials produced at Hagfors have been subjected, the author is satisfied that their quality is superior both to the open-hearth and the Bessemer products. While it is true that no scientific investigations have been made into the causes which make such results possible, we are justified in assuming that the superiority of the product of this electrical process is due to the relative absence of gases and the small amount of slag. The process works constantly under exclusion of air, and with a slight over-pressure in the furnace. Attention is specially directed to the low percentage of carbon (0.02), and it may confidently be expected that cheap stainless iron and steel produced by the "one single process" will soon appear on the market.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Metal Finishes.

I wonder if you can explain what is meant by the term "real B.M.A.," in relation to metal-work finishes, and why this particular finish should be so costly.

My knowledge on this question is extremely limited, but I was always under the impression that silver finishes were the most expensive. Is "real B.M.A." finish applied to ordinary brass-work, or must it be used only in conjunction with a special metal? Is it a "finish" or is it a special metal alloy?

Contractor.

October 9th, 1925.

Broadcasting Power.

I was very pleased to see in the current issue of the ELECTRICAL REVIEW Mr. H. P. Amphlett's comments on the above subject. Since Professor Low's article some discussions by misled wireless enthusiasts of my acquaintance have sounded like the tales of the "Arabian Nights."

In view of the poor transmission efficiency compared with present-day methods I think Prof. Low is looking "well ahead."

R. C. G. Knight.

West Hartlepool, *October 10th*, 1925.

Is the Contracting Business Degenerating?

According to "Polyphase," it is doing so, but perhaps he is one of those sort of contractors who walk about telling others what to do; if this is so, it is certainly adding to the expense, and in addition he may have a showroom with assistants, a portion of which must surely be added on to his quotations. He certainly overlooks the fact that there are many contractors like myself, who work hard on their own installations and do their booking, &c., in the evenings. I, for instance, can carry out work on new buildings at 10s. 6d. per point in all-British materials (C.J. tubing and Grip fittings) within a radius of twenty miles of London, installation tested and fully guaranteed, and can easily earn 25s. a day; in addition, I usually sell some article or other, which altogether brings in a very handsome income. The days are gone when a contractor sits at home, while others work hard to keep him; why should they?

I find that the contracting business is better to-day than ever it has been before, with plenty of new buildings, and electrical companies opening up in every direction; there is hardly a house built, that does not have electric light, but perhaps "Polyphase" is one of those people who go about paying twopence more per lb. to their tradespeople, &c., and giving their cheeseparing grocer presents? How can he expect the British public to pay a pound for ten shillings' worth of work? He forgets that we are all business people, it is he who is degenerating.

Hard Working Ex-Service Electrical Contractor.

October 9th, 1925.

The Æsthetic Aspect of Advertisements.

I wonder if your correspondent in his travels through Progress Town has ever visited the slums of that city in which so many of us toil.

Here he would find a street which, in the dusk or the fog that mercifully obscures both the palace and the hut, rows of tall, stately houses, he might at first take for the homes of the aristocracy of business—he will indeed read here and there in gold letters, still distinguishable on their grimy window frames such fine old names as John Reactionist, Merchant, Tory Inertia and Tory, The Archaic Manufacturing Company, and a host of others, who in council hall and platform so vigorously opposed the building of Advertising Street.

Let him enter one of the tall mansions, it is also no longer more than a tenement of noisy dens and garrets, candle lit, unappetising, and strangely, although each room is tenanted, there is never a name on the door, and the grim janitor who guides him assures your correspondent that tenants do not live here long—some fatten it is true, bloat, and explode, the victims of a disease to which has been given the name "Integrity in Commerce." Here lurk the long firm, the manufacturer of adulterated foodstuff, all the parasites of business who prey on the good names of their brother traders. There is no rent to pay in Obscurity Street—there are no morals—no rules save one: "Thou shalt not tell."

Progress Town is large, there are many districts; in one your correspondent may find a temple to the Goddess "Truth." Before the temple stands a plain but noble statue erected by the people of the world. It is dedicated curiously enough to the pioneers of Advertising, and perhaps you will permit me to give to the readers of the ELECTRICAL REVIEW the epitaph:—

"These men wrought well, wrought for all, and took just pride in that they wrought. They swore that never would they fail the little world who believed in them, and to this they set their brand and name. That others might have of their service, they risked their all to publish far and wide advertisement of their pledge to which they set their brand. Their names are to-day in every mouth, their memories are happy ones. They were so sure that they wrought well that they told all the world. In Life they gained prosperity, at death they left behind a Good Name, than which there is no greater legacy."

Advertiser.

Liverpool, *October 9th*, 1925.

Electric Wiring.

In your notes in this week's issue you give an extract from *The Dominion* (a New Zealand publication) which goes to prove how things are done "out there."

No country is so lax in framing or carrying out the existing regulations with regard to wiring as Britain, and one wonders just how far our Rip Van Winkle authorities will allow the present state of matters to drift.

The plumber, decorator, &c., have been discussed many times in your "Correspondence" columns, but indeed these individuals seem to be getting more rope than ever, and are even backed up by our law courts. What a contrast! In Australia it has been reported that incompetents are fined for carrying out electrical work, but in this country a law court decision has gone against a certain Corporation for having refused to connect an installation which had been wired by a plumber. Ugh!

I have raised this question with prominent supply company officials, and I am given to understand that anyone is allowed to carry out electrical work, no matter whether they are tailors, bakers, plumbers, &c.

The foregoing facts are (in my opinion) the cause of the scandalously low prices at present ruling in the contracting business. Granted, the incompetent tenderer soon hangs himself—but a new one jumps up, and so the game goes on.

What would happen if I attempted to practise as a doctor, lawyer, &c.? In these professions I contend my knowledge

is equal to that of numerous incompetent persons who are at present practising as full-blown electrical engineers.

Some of your correspondents may be able to suggest a remedy for this unfortunate state of affairs. I admit. it is beyond me.

Polyphase.

October 10th, 1925.

Individually Driven Textile Machinery.

You published an article under the above heading in your issue of September 11th on page 410.

A statement is made that with 1,000 h.p. of motor working at full load for 2,200 hours per year and energy at 1d. per unit, the saving is over £60 per annum. This is based upon high-performance machines having 6 per cent. higher efficiency than normal.

We think the amount of £60 is incorrect, and that the actual saving is £456 per annum.

It will be seen from this corrected figure that the extra cost of high-performance machines is more than justified.

Accepting Mr. Haigh's statement that these machines cost 5 per cent. more than ordinary motors, then with an installation of motors costing £5,000, the additional cost is wiped out in a little over six months.

Drake & Gorham, Ltd.

W. Hartley, *Chief Engineer.*

Manchester, *October 8th*, 1925.

[The error was set right by the author in a note which appeared on p. 466 of our issue of September 18th; for £60 read £600, and for 25 per cent. read 240 per cent. The correction, however, could not be given the same prominence as the original article, and in view of its importance we are glad of the opportunity to repeat it.—Eds. Elec. Rev.]

Rural Electricity Supply.

I have to thank Mr. Bartholomew for quoting the case of Mid-Cheshire in his attempt to convict me of "overstatement." Mr. Bartholomew, when quoting from my letter, omitted the essential point which demolishes his charge and puts the boot upon the other foot. Your readers have only to add the words "every paltry interconnecting circuit," which just preceded the part comprising Mr. Bartholomew's quotation and limited my remarks to that class of circuit, intermediate between trunks and subscribers' connections. We have in our scheme to cross several of these circuits; they are not delicately balanced and compensated as is the case with "trunks." They are ordinary simple lines, just a little heavier than subscribers' lines, and they run between Northwich and the neighbouring towns. They are run underground in the towns and suburbs and overhead in the intervening country—the latter purely on account of cost. In more congested areas they run underground all the way. These lines are not, in fact, either long or critical. They consist of half-a-dozen circuits, more or less, to each town, but the Post Office refuses to put them underground. It transpired when I asked "why these circuits could not be put underground," that *the Post Office Rule is to refuse* to put underground any but subscribers' connections, so that, as I stated, the talk of speech efficiency is a mere smoke screen to hide the fact that these lines, or many of them, could be put underground but for the "Rule." It follows logically that Mr. Bartholomew has greatly overstated the consideration given to each case, seeing that all that is done is to sort the crossings into two types—Subscribers' Lines and others. The 23 points where the Post Office offers to put its lines underground in fact include only subscribers' lines, and all of that type to which my statement applied are refused.

Mr. Bartholomew might have the records investigated and state how many town connections or "junctions" the Post Office has offered to put underground for my company and for other undertakings, or if he still states that there are serious difficulties he might write a technical article showing why such interconnection lines cannot be put underground. He should, I suggest, take the Northwich, Middlewich and Winsford lines as an example. We cross them twice, and the cost of our doing so underground would be £500 against £50 or so if the Post Office goes underground, so that the expressed anxiety of the Post Office to help has something substantial to actuate it. Mr. Bartholomew can justify his statement in the future by seeing that his assistants give that individual consideration to speech efficiency, &c., in each case—including those in Mid-Cheshire referred to by him—which he, I am sure, *thinks* has been given in the past, but which, in fact, has not been given. By so doing he will earn our gratitude and a great step will have been taken to ease the situation, because the inevitable result will be that many of the "paltry interconnecting lines" will be put underground for us.

Mr. Bartholomew will, I know, forgive those of us who make ourselves a nuisance in order to secure a change of policy. He, as a member of the Post Office staff, knows that this is the only way to secure reform in dealing with a huge organisation bound on all sides by rules—many of them handed down from times when conditions were different. The Post Office staff itself knows that persistent agitation was necessary to secure for itself reasonable treatment from the Government. Our history is one long record of reform wrung from reluctant authorities by means far more forcible than I have advocated.

The Post Office itself is making an attempt to give the rural dweller a telephone service on a specially cheap construction by means of party lines; we hope that the "golden rule" will be carried out by it, and that we shall have the help of the higher officials in securing the removal of obstructions. Personally, having carried out contracts for the Post Office years ago, putting these subscribers' lines underground—and be it noted also town interconnecting lines, such as those we now find in our way in the country districts between towns—I can add my tribute to that of Mr. Borlase Matthews and of yourselves to the personal qualities of sectional engineers. I have none but pleasant recollections of them in the past, and in my present dealings with them. The trouble is that they can do nothing for us—we must get at the higher officials, and we are glad that Mr. Bartholomew has taken notice of the situation.

It is the policy of some companies and local authorities to confine their operations to the towns and to underground work. They say overhead work is too troublesome; the delay is too great and the Post Office too obstructive. In the meantime some of us are energetic enough to stretch out as far as is possible from moment to moment. We have to make ourselves a nuisance to those who block our way by the ramparts of "things as they are," and eventually we get them to move out of our way and allow "Things as they ought to be." Our successors will have the comfort our present discomfort will secure for them, but we will have had the pleasure of pioneering a great movement.

W. Fennell.

Northwich, *October 12th*, 1925.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1923.

Men of Vision.

IF the ELECTRICAL REVIEW were to organise a competition asking its 13,000 supporters and its 40,000 readers (somebody has given the number of readers as three per copy circulated) to record a vote showing whom they regarded as the outstanding figure in the British electrical industry, what would be the result?

Where shall we look for the man whom the majority opinion would place upon this high and proud pedestal? Would he be an inventor?—a manufacturer? an Association man? a manifold director? a Commissioner? a contractor? Would he be any or all or none of these things? Each section, no doubt, has its own leading spirits, but where is the one comprehensive person possessed of all the electrical virtues to enable him to speak with authority to and for all?

There are amongst us men renowned as scientists and discoverers, as manufacturers, as organisers, as public policy specialists, as financiers. Their merit in their own particulars sphere is unquestionable. Some of them filled a large space in their younger days, but with the inevitabilities of passing years they have to rest content with achievements recorded and with honours won, adding here and there a little to their contribution to progress, but conscious of Nature's limitations.

It has been our privilege to witness the first appearance on the electrical stage of many electrical men, to welcome their progress and advance to positions of eminence, to note their bearing as, favoured with success and laden with many honours, they have passed meridian and seen the wisdom of leaving to others the conquering of battlefields upon which they once hoped to see further duty. They have made their magnificent contribution, and the electrical industry will for ever remain their debtors. We recall, as we write, man after man who, once the most active, popular, and honoured in our ranks, and still interested in electrical affairs, is practically unknown to a large proportion of the electrical *personnel* of to-day. We greet them in passing on our way searching for the leader who would meet with general acclaim to-day if we needed one to lead us with experience and energy, enthusiasm, and greatness of vision.

Leaders are always in the making. Necessity is the mother of invention, emergencies make heroes, and

opportunities produce leaders. There are plenty of men amongst us who to-day are just a little known, who in a few years will be "at the top of the tree"—in the nature of things it must be so. Can we by anything we say accelerate the rate of their progress? The opportunity in the electrical industry is surely great enough—there never were such times—and the men are on their way no doubt; some may already be before the footlights while others are lost for a time in the quietness that enfolds associated deliberations; but they must be there, and sooner or later they will emerge.

It used to be said that there were no millionaires in the electrical industry on this side of the Atlantic. We do not mind so much if there are none to-day. It is not men of big wealth that we are seeking at this moment—if Britain's industries are allowed to flourish again we shall have them as an accompaniment of our progress—what we want to unearth or to encourage are men of big views, of large vision, who look upon electrical expanse as limitless. There are too many who by Nature's limitations, or owing to their own circumstances, are content, or shall we say compelled?—to continue long engaged in a mass of petifogging details which prevent their own development and yet which often enough were better left to others. An industry, however, needs all grades, and every man can render an essential service necessary for the efficiency and well-being of the whole; but it needs outstanding leaders, and a recent article in the *Electrical World* inclines our thought to the very interesting question whether the present golden opportunity is producing in, or attracting to, the electrical industry of Britain, men of the grand vision type.

In recent years we have seen restless ambitious men breaking down through over-zeal; we have seen men becoming directors of innumerable companies, but discovering that natural limitations have prevented them from becoming master of more than one or two of them. Yet big things are afoot; big opportunities are at hand; and big and commanding personalities may be required in an industry whose electrical stake is so many millions as to make it a colossal affair before it is anything like fully expanded.

This need for big men is recognised on the other side, though things electrical there have reached a much more advanced stage than they have here, and is expressed in the contemporary referred to, by Mr. E. W. Lloyd, the chairman of the National Commercial Section of the National Electric Light Association.

The particular aspect of our subject with which Mr. Lloyd is concerned, is the need for big commercial men with vision at the head of American public utilities. Have we no such need here too? In reply to a question put to him by our New York contemporary, he has no hesitation in saying that the need of commercial departments of utilities is for more leaders with broad enough vision to see the real problem that lies ahead. Utility managements need to realise that commercial departments require as leaders men of outstanding ability to see that the big problems of those departments are economic as well as technically commercial. "Many of the problems of future growth are first of all economic and commercial; many undertakings, although entirely feasible as an engineering project and easily financed and even popular with the public, may yet be commercially unsound." Developing the theme, two companies operating in similar cities with equal possibilities of development, do very different total business; one sells two and a-half times as many kWh per residence as the other. Why is it? There is something lacking somewhere! Mr. Lloyd asks how many executives have even gone so far as to know what other companies or cities like their own have accomplished. With all that we hear of the more general use of electricity *per capita* in the States, it still seems that by no means all executives sense the value of statistical comparisons, and the question is put: "How many sales managers know enough of the economic situation in their territory to establish a real basis for judgment of performance?"

The organisation of electricity supply in the States differs in many respects from what obtains here, so that what Mr. Lloyd declares to be an essential in the States may not be our own need, but seeing our low consumption *per capita*, there is deep necessity for those in command here to indulge in keen rivalry respecting rate of progress and efficiency of commercial control making for that end. We have not to judge by what we have already achieved—we have to be urged forward by the possibilities that await the pursuance of a policy of full enterprise. The lament of Cecil Rhodes should give us our impetus: "So little done!—so much remains to do!"

Without entering too closely into Mr. Lloyd's advice to American utility authorities, it is necessary to quote a few sentences to sufficiently indicate what its general purport is, and leave it to electricity and other authorities in the United Kingdom to see how far the counsel can be adapted to English conditions. "Every holding company could well afford to have as the head of its commercial activities a man who is able and willing to investigate, study and compare the economic, industrial, and commercial condition existing in every part of the company's territory. Instead of waiting for the various commercial district representatives to report how well they were doing their job in their own territory, the real commercial executive should know in advance what to expect from each territory and should be able to place his finger on the cause for failure and to point with accuracy to the prime cause of success. . . . The real commercial leader of the present needs not so much to know the features and characteristics of the particular appliance and services he has to sell as to know the economic habits, industrial practices and home customs of the community he is trying to serve."

As chairman of the Commercial Section of the National Electric Light Association, Mr. Lloyd is concerned with the manner in which that organisation is filling the bill. If his Section is to act effectively, commercial executives of every member company should attend a convention to consider the big economic and commercial problems facing the industry, the discussions being contributed to by men of authority in that industry; the technical discussion of commercial problems and other detailed matters are subjects for interim report and executive discussion. We have many excellent organisations, but we never have had anything corresponding to the National Electric Light Association, though it has often been suggested. No doubt if we had such, it would be a suitable ground or platform assisting in the development of big men. It would probably be able to embody, or act in co-operation with, existing organisations, and spread throughout the supply industry a thrill for progress. As the day of big areas is with us, the parochial spirit will give place to the larger view and create conditions favourable to the development of big men.

Summing the whole matter up in its bearing upon United Kingdom development, we judge that while there are many excellent chiefs amongst us, we labour under a shortage of men with big ideas, big determination, and big push—leaders who, when armed with authority, can carry their fellows along with them to a flood tide of success. We may surely say with Mr. Lloyd:—"Utility managements that have the wisdom to use commercial executives of vision, able to see the economic as well as technical problems of their job, and who will back such an executive in a comprehensive study of the company's markets and an analysis of the company's sales performance . . . will have a commercial department of which to be proud."

Factors in Electricity Supply.

On Friday last, at the annual dinner of the Electrical Power Engineers' Association—which marked an epoch in the history of that body, in that the Minister of Transport, the Chief Electricity Commissioner, and the President of the Institution of Electrical Engineers honoured it with their presence—all three of these gentlemen referred hopefully

to the electrification of our railways and the influence that it would have upon the future of electricity supply. In the *Observer* recently Sir Philip Dawson, M.P., also dealt with this question; both he and Mr. R. A. Chattock laid stress upon the cheapening of electricity for all purposes that would result from the better load factor that would be obtained at the generating stations. Sir Philip feared, however, that little would be done "until the present apathy of the directors and of the management of many of our railways has been overcome, an apathy which has been materially increased as a result of the grouping." This apathy, he thought, could only be overcome by demands from the public; it was not finance that stood in the way, but the disinclination of many railways to make any change, however beneficial.

It may be that main-line electrification has been deferred by the grouping of the companies, but we doubt whether the electrification of the south-eastern suburban lines would have come about so speedily had that system remained isolated. For the rest, we hope that the pressure of public opinion to which Sir Philip appeals will be forthcoming, for we wholly agree with him, and with Mr. Chattock, that the general electrification of our railways will confer great benefits upon all consumers of electricity, besides facilitating the supply of electricity in many rural districts which will otherwise be difficult of access. Sir John Snell, by emphasising more than once the importance of rural applications of electricity, and Mr. Chattock, by drawing attention to the necessity of reducing the cost of distribution of electricity in such areas, fortified our belief that the tide is setting in the direction of modifications of the regulations for overhead lines whereby the cost of construction and maintenance will be reduced to a reasonable figure, and we earnestly hope that the committee which has been appointed by the Institution of Electrical Engineers to consider regulations suitable for country districts will lose no time in drawing up a code better adapted to the requirements of the case than those which at present hamper the efforts of enterprising station managers. A similar committee was appointed by the I.M.E.A. Council some time ago, for the purpose, as stated in the annual report, of considering "the possibility of drafting Regulations which, while giving the public ample protection, will be simple to carry out and involve less expenditure in the execution of works."

Another point which was touched upon by Mr. Chattock was the possibility of a *rapprochement* between the electricity and gas industries, whereby the problem of securing a more efficient utilisation of fuel might be achieved; he urged his hearers to do all that they could to promote co-operation with the gas industry—an object with which, as we have shown on previous occasions, we are in hearty sympathy.

As for the question of load factor, we have repeatedly urged that this is by far the most effective and promising means of cheapening electricity. With the average coal consumption of the whole country already reduced to 2½ lb. per kWh in our generating stations—only half a pound more than the Electricity Commissioners have suggested as the practical attainable limit—improvement in that respect is becoming increasingly difficult; but by raising the load factor from 25 to 50 per cent., the price of electricity can be halved right away. We are glad that Mr. Chattock has emphasised this point, the importance of which cannot be overestimated.

Wireless Exhibitions.

A letter in this issue from Mr. L. F. Fogarty prompts us to raise a question that must have been present to the minds of most visitors to the wireless exhibitions which have recently been held in Kensington and Westminster respectively—namely, why should there be two exhibitions, neither of which is complete or fully representative of the industry?

Of course, the answer of the National Association of Radio Manufacturers and Traders is not far to seek: the Association desires to compel all manufacturers of radio sets and accessories to come into its fold, and to convey to the public the impression that within that charmed circle alone are the reputable concerns to be found. That is a perfectly comprehensible policy to which, in the abstract, no one could take exception; the industry needs a representative organisation to look after its interests and to defend it against foreign competition, and whilst we do not endorse every item in its programme we are in full sympathy with its main aspirations. But it cannot be claimed that the Association as yet embraces all the leading firms, and there is a large number of the smaller ones outside its ranks.

Now, an association of British manufacturers owes a duty not only to its members, but also to the nation, and we cannot think that by inducing the wireless public to visit two exhibitions of the same class of products it is serving the best interests of the community. We suggest that next year one exhibition only should be held, open to all British manufacturers; within its doors the exhibitors might be divided into two groups of members and non-members of N.A.R.M.A.T. respectively, or other means could be adopted to distinguish between them. Only by holding one large exhibition can our manufacturers produce the same impression as the large exhibitions held in the United States and on the Continent. Co-operation and mutual support are indispensable to our success in competition with our neighbours.

An important matter ventilated by Mr. Fogarty is the admission of manufacturers of wireless apparatus of all descriptions; instead of confining the display to broadcast receiving sets and accessories, let it be a real Wireless Exhibition. Broader and longer views are called for on the part of the organisers. The system in vogue at present is wasteful of effort, prodigal of outlay, and detrimental to our national prestige. We strongly urge the directors of both exhibitions to consider the matter with open minds and do better next year.

Scientific and Industrial Research.

The report of the Committee of the Privy Council for the year ended July 31st, 1925, takes note of "the growing appreciation on all hands of the contribution that science can make" to the solution of present-day problems, and expresses the belief that the depression in our staple industries does not arise from the neglect of science. On the other hand, it comments on the very great "time-lag between the new discovery in the laboratory and its commercial exploitation," which appears to us to be very much the same thing. It is one of the functions of the Department of Scientific and Industrial Research to shorten that time-lag and to accelerate the adoption of new methods and processes, which are, above all, necessary at a time of depression. It is regrettable to read that many of the existing associations are only keeping their research organisations "in existence" with the help of the Department, whilst awaiting the return of prosperity; surely it is precisely when trade is sluggish that activity in research will have the most immediate and welcome effect in stimulating the revival of industry. In this connection we are glad to see that the Advisory Council is "making an intensive study of the activities of the Department in aid of industry," and that the Committee looks forward with interest to its report. We hope that the Council will examine its policy with the utmost rigour, and in particular will inquire whether it has been niggardly where it should have been generous. The fact that out of a million pounds paid over to it for immediate needs it still possesses at the end of nearly ten years no less than £518,000 is not a matter for congratulation, but for reproof. The Council deplores that after that period its facilities for the conduct of research are not sufficiently widely known. We are pleased to see that the Department is prepared to consider suggestions for the conduct of research at any of its stations, not only for firms and associations, but also for individuals when the results are likely to be of general interest or when facilities for the work do not exist elsewhere, on favourable terms.

Electric Baking Ovens.

An Important Application of Electricity.

From our point of view the principal attraction of the recent Bakers' Exhibition at the Agricultural Hall, which was briefly mentioned at the time of the show, was the three examples of electric baking ovens exhibited by well-known electrical firms.

The largest equipment was shown by the Metropolitan-Vickers Electrical Co., Ltd. This was the "Metrovick" conveyor oven illustrated in fig. 1, a development of the Westinghouse reel oven introduced into this country some three years ago. The reel oven had a capacity of just over half a sack; it was automatically controlled and easy to operate, but it was designed for the usual American 1½-lb. loaf, and the baking shelves were too narrow to take the size of baking sheet generally used in this country. The whole oven was accordingly re-designed and many improvements were made. The oven proper is a comparatively light but very rigid all-steel frame, enclosed by double-cased sheet-steel walls, divided into separate panels to facilitate dismantling. The panels are packed with 2½ in. of slag wool backed up with 2½-in. blocks of asbestos magnesia. This improves the thermal efficiency of the walls and considerably prolongs their life. Mounted on an inner framework is a chain conveyor carrying seven shelves, each 73 in. long by 20 in. wide. These form a baking area of 71 sq. ft., and during the baking process the conveyor continuously travels slowly round the oven, being driven by a small motor at such a speed that each shelf passes the door about once a minute. The conveyor can be instantly started or stopped by a small switch below the oven door. The heating elements are specially designed for heavy service, being wound with ribbon ½ in. wide. Stout steel bus-bars carry the current from the mains to the heaters. The latter are mounted on a light framework fitted with rollers which can be drawn out for inspection. The heaters in the bottom of the oven are connected in two circuits, six (25 kW) being automatically controlled, and the other four (17 kW) being controlled by a hand switch. A thermostatic device is fitted to maintain the oven at a predetermined temperature.

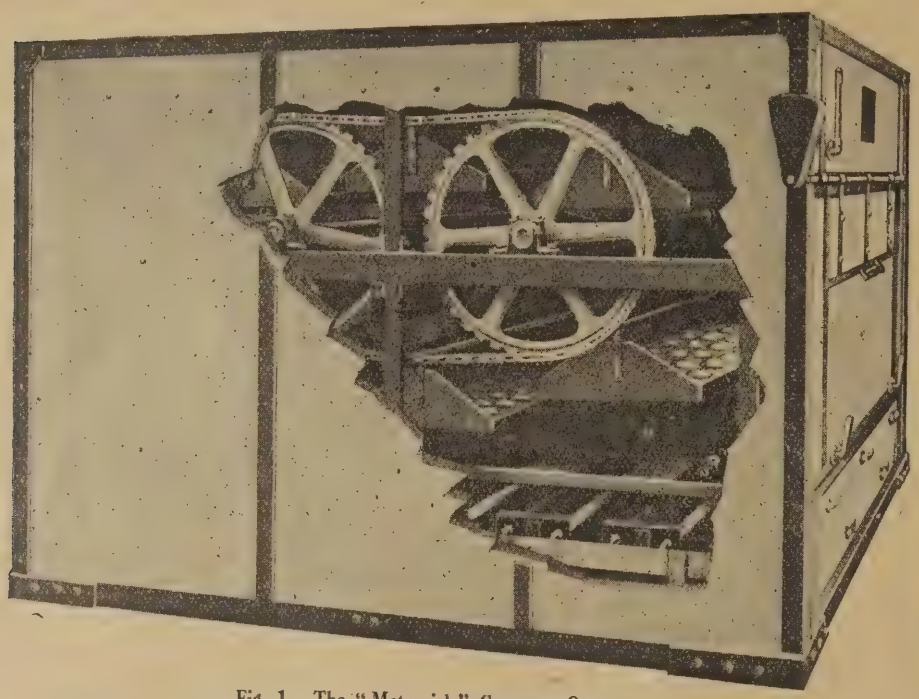

Fig. 1.—The "Metrovick" Conveyor Oven.

The Artofex Engineering Works, Ltd., showed a typical example of its baking-oven manufactures (see fig. 2).

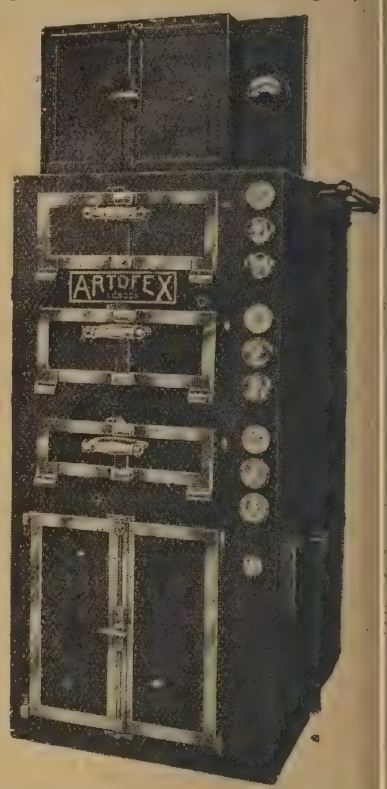

Fig. 2.—An "Artofex" Baking Oven.

The oven is constructed on the "unit" principle, that is, the main portion consists of a single baking chamber, with its controls, beneath which is a hot cupboard. Upon this additional baking chambers can be mounted as required, being simply secured at the sides, and if desired another hot cupboard can be placed on the top. The hot cupboards have slides to receive trays. Each baking chamber unit can be regulated for top and bottom heat. The range of heating is covered by seven combinations, and each unit comprises the necessary switches, with fuses, thermometer, and vent pipe. The heating elements are rigidly constructed, and are so

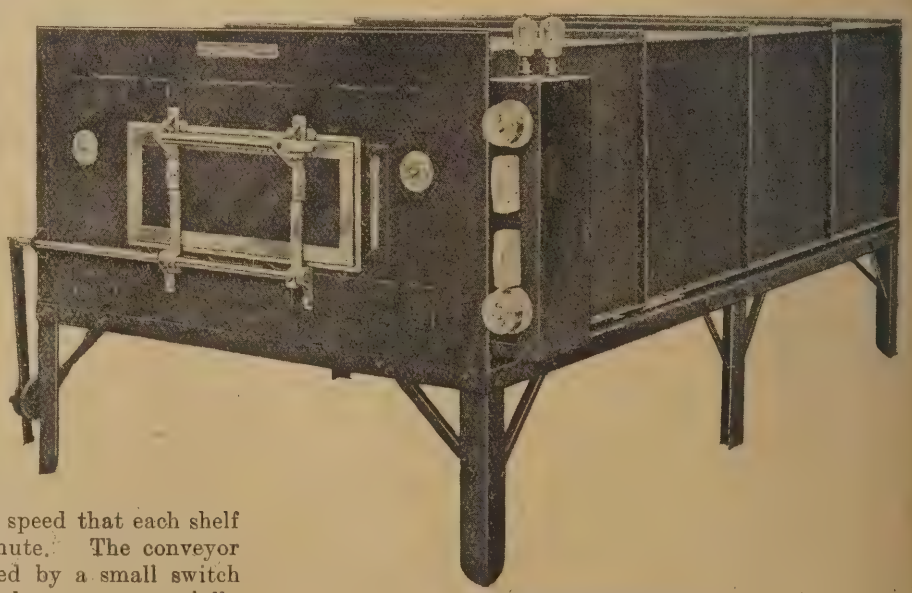

Fig. 3.—The "Magnet" Baking Oven.

graded in wattage as to ensure a uniform heat, as the losses at the sides as compared with the centre are naturally larger. All elements are readily detachable, and they are efficiently insulated to conserve the heat. The consumption of the ovens ranges from 5 to 14 kW, and the weight from 7 to 19 cwt., according to the size and combination of the units. The baking chambers are made in three sizes, *viz.*, 28½ in. by 20½ in., 36 in. by 20½ in., and 40 in. by 28½ in. They are fitted with three slides on each side of the interior to receive trays, so that if three trays are fitted the total baking surface of each chamber is trebled for the baking of flat articles. Nine combination sizes are available, the area of the baking chambers varying from 5 sq. ft. to 24 sq. ft., and the hot cupboard space from 5 cu. ft. up to 16 cu. ft.

The third example is a product of the General Electric Co., Ltd., to which brief reference has been made in our pages on a previous occasion. This baking oven is depicted in fig. 3. The body is of best-grade sheet steel mounted on a rigid angle-iron framework, double-cased and heavily lagged to prevent heat loss. The cast-iron door is fitted with suitable balance weights. The sole of the oven is fitted with special removable firebrick tiles, and the heating elements are arranged at the top and bottom, each set of elements being separately fused and controlled by three-heat switches with indicating lamps. By this means a wide temperature range is obtainable. The heating elements are inserted from the side of the oven, the wiring being arranged so that the poles are at either end of the element, and by disconnecting it at both ends the element can easily be removed. The top elements are screened, and the bottom ones are fitted below the tiled floor of the oven to prevent contact with the steam produced in baking operations. In common with the other types of electric oven, the apparatus is self-contained and portable; no flues are required; and ease of operation, absolute cleanliness, and continuous working are ensured.

Another Wireless Exhibition.

A Review of the Novelties at the Horticultural Hall.

The second London radio exhibition of the season was housed in the Horticultural Hall from October 10th to 16th, and afforded an opportunity to those manufacturers and traders who are not members of the N.A.R.M.T. to display their wares. It was on much the same lines as the show held last year at the "White City," but cannot be compared with last month's Albert Hall exposition.

The majority of the exhibits were in the form of components and "gadgets"; a number of firms made a feature of appealing to the public direct, and the hall was well filled, but amongst the complete sets few were noticed that can be described as quality instruments.

Receiving Sets.

Complete 3-, 5-, and 6-valve portable sets with frame aerials mounted in the wooden or leather case which houses the entire outfit were displayed on several stands, but the portable set, as a type, is somewhat of a freak and cannot be expected to produce as good results as the conventional pattern. The quality of Western Electric receiving apparatus is well known to those who can afford it, and amongst the Peter Curtis "Duodyne" regenerative sets an 8-valve super-heterodyne outfit was noticed for which big claims are made. On other stands there were several supersonic receivers, which type of multi-valve circuit is of undoubted superiority when properly constructed. An attractive outfit is supplied by the Igranic Electric Co., Ltd.; it consists of the essential units and special accessories necessary to construct a 6-valve receiver of this sort, the diagram and instructions, together with the special method of mounting the components (a distinctive feature),

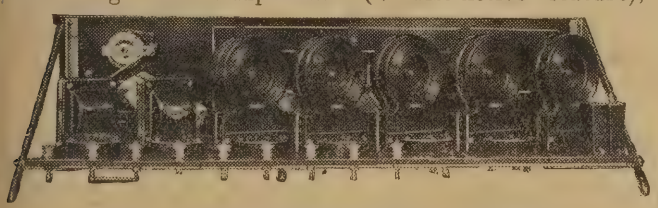

Fig. 1.—Igranic Super-heterodyne Set; Back View.

enabling the set to be assembled, as shown in fig. 1, without difficulty. The various components may also be employed to construct a receiver to any design favoured by the constructor and in conjunction with accessories of other makes that he may already possess.

Amongst the crystal sets, Mr. A. Hinderlich had an oscillating crystal in operation; that is to say, an electric current was fed from a battery through the cat's-whisker itself to the crystal. The metal plate "crystal" exhibited by Kathoxyde, Ltd., is mounted in a small brass cup and may be soldered, screwed, or clamped in any ordinary type of cup holder. Care should be taken not to scratch the surface, but it can be cleaned by wiping gently with a dry cloth. For short-distance work a zinc-iron ball cat's-whisker is used and graphite for long-distance operation, both of which types are provided with springs for attachment to detector arms.

Novel Condensers.

Several novel forms of variable condenser are of considerable interest. The "Newey," fig. 2, noticed on the stand of Messrs. Pettigrew & Merriman, Ltd., is a "zero-loss" square-law type, the vanes being rectangular plates of brass with an exceptionally fine clearance between them, and they are all bonded

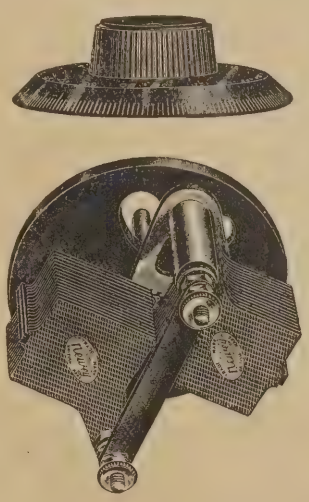

Fig. 2.—"Newey" Rectangular-plate Condenser.

together. Both sets are rotated in such a way that the overlapping section is always a perfect rectangle; the two brass spindles are separated by two air gaps, and there is no end plate, just a light Bakelite tie bar for rigidity. The tuning knob, dial, and also gearing are all made of Bakelite, the square vanes being bonded, as one unit, to Bakelite sectors moulded with involute teeth and gearing, with a central pinion in the ratio of 4½ to 1. Very fine adjustment is the feature of another condenser of unusual appearance. Shown by Rapinet, Ltd., its fixed vanes are all of different sizes, the first being semi-circular and the last a segment little more than half this size. Consequently the set of movable vanes comes into mesh with the fixed set one at a time, while a geared control causes the axle to move up and down the centre spindle and so enables the clearance between the vanes to be varied at will.

Another condenser of unorthodox appearance was noticed on the stand of the Fellows Magneto Co., Ltd.; the usual multiplicity of vanes is replaced by two sheets of copper foil separated by a sheet of mica, and the variation in capacity is effected by altering the distance between the copper sheets with the aid of a cam of a suitable profile to give a square-law effect.

A New Aerial Insulator.

The feature of the "Everdry" aerial insulator, shown by the Silvertown Co. (India-Rubber, Gutta-Percha, and Telegraph Works Co., Ltd.), is indicated by its name. It is made of rubber, the strain being taken by very fine cotton threads, the fibres of which are impregnated with rubber similar to a motor-car

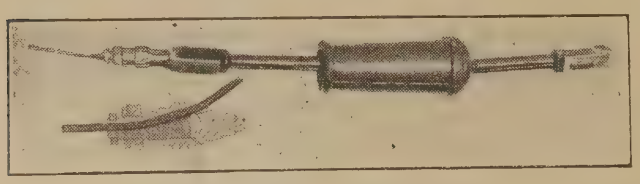

Fig. 3.—"Everdry" Aerial Insulator.

tire; the threads pass round ebonite blocks at each end, and are covered with rubber, the whole being vulcanised together. The rubber is protected from the atmosphere by a coating of non-hygroscopic enamel; moisture does not condense on this type of insulator, and, as is indicated in fig. 3, a cup is provided which keeps a portion of the insulator dry in wet weather. The illustration shows the non-slip grip, and swivels are provided at each end, the shackles being made of "Duralumin" to reduce the weight. The diameter of the insulator shown is 5/16th in., and the length of the insulated portion is 7 in.; it weighs 2¼ ounces, and the breaking strain exceeds 350 lb., but a smaller type weighing ¾ oz. is available.

A Simple Rectifier.

A neat rectifier for charging batteries, economical alike in operation and first cost, was shown by the Fellows Magneto Co., Ltd. From fig. 4 it will be seen that the base contains a transformer which is plugged

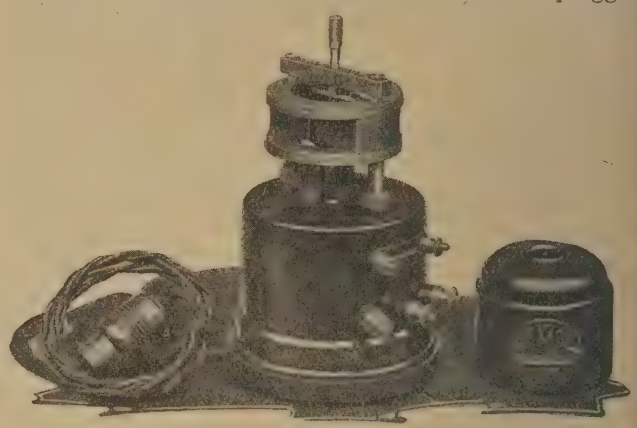

Fig. 4.—A Battery-Charging Rectifier.

into a lamp socket, and the spindle of the motor at the top projects through the casing so that the machine may be set in motion by a twist of the finger and thumb. The two upper terminals are for a fuse, and the three lower ones are provided to give 4- and 6-volt charging pressure as desired.

(To be concluded.)

The Supervisory Control of Sub-Stations.

Metropolitan-Vickers Automatic Plant for New Zealand.

(Concluded from page 623.)

The fact should be borne in mind that, for the operation of the plant described last week, only three single wires are necessary between the control point and the distant sub-station. Ordinary telephone communication can be carried on over these same wires, which may consist of 20-lb. telephone wires, or their equivalent in multicore cable, say, 3/22 per core; one wire is used for sending selective signals or receiving indication signals, another is for performing operations, and the third is a common return. The usual telephone guard circuits and protective devices are provided, and provision is made so that if a circuit breaker changes its position while impulses are being sent from the control desk to select a device for operation, the sub-station signal is stored until the incoming impulses are completed, when the latter are cancelled and the stored signals sent through to the control office as usual.

Although for 600-V tramway requirements M.-V. quick-acting contactors are suitable, it was decided that in one sub-station an M.-V. high-speed circuit breaker should be installed in conjunction with the load-limiting resistor. This breaker is of a type that has been tried out on exacting railway service at 1,500 volts; it also has been subjected to a series of some 50 short-circuit tests at 1,500 V on 2,500-kW rotary converters, during which tests 45,000 kW of generating plant was on the bus-bars in the Barton (Manchester) station, from where a feeder was run direct to the site of the tests. In addition to the closing coil, the breaker has a hold-on coil for maintaining the breaker in the closed position against powerful throw-off springs; also an impulse coil is connected in shunt to the blow-out coils. In the event of a sudden rate of change of current, due to a short circuit, the impedance of the blow-out coils gives rise to a high voltage across the impulse coil which causes a high momentary rush of current that acts so as to shunt the flux away from the armature of the hold-on magnet; the throw-off springs thereupon open the breaker. A splitter assists to extinguish the arc as it is blown upwards through the arc shute, and the average speed of operation of these breakers is approximately 0.008 second. In addition to the operation of the impulse coil on faults, the high-speed breaker is tripped by a current relay (to cut in the limiting resistor) should the load exceed the safe capacity of the machine. Emergency hand operation is provided for the breaker and the main and feeder d.c. contactors; the latter when under manual control are latched in and are fitted with a trip coil and overload attachment.

To protect against earth leakage on the machines, the bed plate is insulated (a concrete foundation is sufficient) and connected to earth through a flash-over relay, which will operate in the event of a fault to earth to shut down and lock out the machine affected.

The fact that supervisory control is looked upon as having passed the experimental stage is evidenced by the fact that an order has been received by the Metropolitan-Vickers Co. for supervisory apparatus for a rotary converter system aggregating 20,000 kW, which this company also supplied in its entirety.

In addition to the two above-described 750-kW rotary converters arranged, with their eight traction feeders, for automatic operation by means of supervisory control, the Metropolitan-Vickers Co. has in hand similar equipments for sixteen 1,250-kW rotary converters for the

Bombay, Baroda and Central Indian Railway. A large number of automatic equipments have also been supplied for control on other systems. In process of erection in the shops at the present time there are no fewer than 15 such equipments, of which particulars are given in Table I, while Table II indicates the principal equipments which have been dispatched from the works and are now either in operation or in process of erection.

Table I.

Automatic Equipment in Progress.

(Excluding two 750-kW and sixteen 1,250-kW supervisory controlled equipments.)

Three 1,500-kW rotary converter and four feeder equipments for the City and South London Electric Railways.

Two 750-kW rotary converter equipments for the Manchester Corporation.

Two 500-kW rotary converter equipments for the Birmingham Corporation.

One 500-kW rotary converter equipment, with seven feeder equipments, for Johannesburg, South Africa.

Two 500-kW rotary cenverter equipments (conversion of existing machines) and eight 750-ampere traction feeder equipments for Bradford Corporation.

One 500-kW rotary converter equipment with three 800-ampere traction feeder equipments for Durban Corporation, South Africa.

One 500-kW rotary converter equipment for the Ilford Corporation.

Two 300-kW rotary converter equipments for the Charing Cross Electricity Supply Co.

One 150-kW rotary converter equipment (conversion of existing machine) for Dumfries Corporation.

Table II.

Automatic Equipment Already Supplied.

Liverpool Corporation ...	2	500-kW rotary sets
Barrow Corporation ...	1	250-kW rotary set
Hull Corporation ...	1	500-kW motor-conv'rter set
Wellington, N.Z., Corporation	1	750-kW rotary set
Durban Corporation ...	3	500-kW rotary sets
Manchester Corporation	1	500-kW rotary set
N.S. Wales Government Railways	2	4,500-kW rotary sets
	2	1,500-kW rotary sets
	1	1,000-kW rotary set
Perth Corporation (Western Australia) ...	4	400-amp. reclosing feeder equipments
Teviot E.P. Board, N.Z.	2	125-kW water-wheel alternator equipments
Wackare Monea, N.Z. ...	1	500-kW and one 350-kW water-wheel d.c. generator equipments
Sydney Municipal Council	12	Automatic induction feeder voltage-regulator equipments
Copenhagen Municipality	2	1,000-kW rotary sets
Mexico City	1	1,000-kW rotary set
Birmingham Corporation	2	500-kW rotary sets

Most of the above installations include a varying number of automatic feeder-control equipments, while the Copenhagen sets are the only automatic ones on the Continent of Europe.

This record is of particular interest in view of the short time which has elapsed since the first automatic sub-station to be set to work in this country was installed in October, 1922, by the Metropolitan-Vickers Co. for the Liverpool Corporation, which equipment has carried out the duties expected of it without any attendance and with only periodic inspection.

The attention of those who are apt to consider that automatic sub-station plant is complex, and that it needs specially trained men for its erection and supervision, is drawn to the fact that the New Zealand plant referred to above was "erected by the Corporation staff," and tests on site showed the overall efficiency to be better than that guaranteed. "Although the economy in running an automatic sub-station, as compared with a manually-operated station, primarily influenced the recommendation in favour of this type of equipment, the greater reliability in operation revealed by the investigations"—which Mr. M. Cable, M.I.E.E., chief electrical engineer, Wellington, N.Z., personally carried out in America and England in 1922—"was a determining factor in the decision to adopt fully automatic plant."

Messrs. Preece, Cardew & Rider were the consulting engineers.

Distribution systems, owing to their recent accelerated growth, have become complicated and more difficult to control. When interruptions of supply occur on manually-operated systems, much time is lost in receiving telephone reports from the sub-stations and transmitting instructions to the operators, but with supervisory equipment the engineer in his office is warned by a bell on the occurrence of anything unusual and receives a visual indication within two or three seconds of any change in the position of the circuit breakers on the system. He can take immediate measures by manipulating the keys on the supervisory desk for dealing with the situation, closing or opening any of the circuit breakers at will. These remarks probably apply with even greater force to the control of high-pressure distribution networks than to traction converter systems. Other forms of remote control, if they have to cover an extensive area or long distances, become prohibitive in cost, owing to the number of control wires required.

Anti-dazzle Vehicle Lamps.—In the presence of the Home Secretary (Sir William Joynson-Hicks) and members of the National Council of the Commercial Motor Users' Association, Mr. E. S. Shrapnell-Smith, president of that association, gave a lecture and demonstration at the Savoy Hotel recently on the subject of "Dazzle Mitigation." It is six months since Mr. Shrapnell-Smith undertook, at the request of the National Council of the Association, to stimulate investigations into various methods of mitigating dazzle by the use of tinted electric headlamp bulbs. Whilst he has come to the conclusion that no one tint or method of treatment holds the field exclusively, he believes that the substitution of tinted and treated translucent bulbs for colourless transparent ones offers a quick and ready method of mitigating dazzle.

According to the *Daily Telegraph* his other conclusions are:—

That yellow or cobalt blue gives the best results in filtering out the offending red rays, and that cobalt blue properly applied yields the nearest approach to true daylight or white light.

That clear yellow or blue glass only eliminates dazzle attributable to light radiated from a white-hot filament, and that a slight degree of opacity on or in the wall of the bulb is required to mitigate the dazzle attributable to the reflected image of such a white-hot filament.

That dazzle can be mitigated to a noteworthy extent by treating half areas of the surface of any headlamp bulb, but that still better results are to be expected from treating the entire bulb.

That incorporation of a pigment in conjunction with the requisite degree of opacity in the wall of the bulb during its primary manufacture may ultimately be found preferable to any method of dipping or spraying.

That where treatment of a bulb is limited to its top half, the best results can be obtained only when the line filament is mounted behind the focus of the parabolic reflector.

That the Association's terms of reference can be met in all respects, and that in the case of one make of treated bulb which has given highly promising results under test, the additional retail charge per headlamp is only ninepence.

That the driving light resulting from the use in headlamps of standard B.A.S. bulbs tinted and treated by either of the methods indicated, possesses the additional merit of penetrating fog and mist to a helpful extent.

The Ministry of Transport has every hope that time will be found when Parliament meets next month for the reintroduction of the Lights on Vehicles Bill, says the *Daily Mail*. The Bill is based on the recommendations of a committee, and its principal clause provides for the limitation of the height of the beams of headlamps so that they fall below the line of vision of pedestrians and the drivers of approaching vehicles.

Electricity Supply in Great Britain.—III.

Hertfordshire and Essex.

The shading on the map on the opposite page is intended to indicate the areas in which statutory powers for general supplies of electricity have been granted or applied for.

The North Metropolitan Electric Power Supply Co. also has various statutory powers under its Acts over all the *unshaded* parts of Herts. (including Waltham Holy Cross and Chingford Urban Districts in Essex), except those parishes which lie to the west of St. Albans Rural District. The Metropolitan Electric Supply Co., Ltd., has bulk supply powers in the south-west corner of Herts. In addition to these two undertakers, there are 28 others whose areas of supply are wholly or partly included in the map. A list of these is given below, the asterisk denoting that the undertaker is in the London and Home Counties Electricity District:—

Local Authorities.

*Barking Urban District Council.
Clacton Urban District Council.
Colchester Corporation.
*East Ham Corporation.
*Grays Thurrock Urban District Council.
Harwich Corporation.
*Hertford Corporation.
*Ilford Urban District Council.
*Leyton Urban District Council.
Luton Corporation.
Saffron Walden Corporation.
Southend-on-Sea Corporation.
*Walthamstow Urban District Council.
Walton-on-Naze Urban District Council.
Watford Corporation.
*West Ham Corporation.

Companies.

Bishop's Stortford, &c., Gas and Electricity Co.
*Brentwood District Electric Co., Ltd.
Chesham Electric Light and Power Co., Ltd.
*Colne Valley Electric Supply Co., Ltd.
*County of London Electric Supply Co., Ltd.
Electric Supply Corporation, Ltd.
First Garden City, Limited.
Frinton-on-Sea and District E.L. & P. Co., Ltd.
*Northwood Electric Light and Power Co., Ltd.
Stevenage Electric Light and Power Co., Ltd.
*Welwyn Garden City Electric Supply Co., Ltd.
*Wickford and District Electric Supply Co., Ltd.

The following particulars in respect of the administrative counties of Hertfordshire and Essex and associated county boroughs are taken from the 1921 Census:—

Acres.	Persons.	Resident families.	Buildings not containing dwellings.
1,384,055	1,803,452	416,108	16,564

The maps which we have used were prepared in 1917 for the Boundary Commission, and are reproduced here by permission of the Controller of H.M. Stationery Office. In order to bring the maps up to date, the following amendments should be noted:—

(1) The Parishes of Dovercourt and Saint Nicholas have been united to form the new Parish of Harwich, which is co-extensive with the Borough of Harwich.

(2) Letchworth Parish has become an Urban District.

(3) Hertford Borough has been enlarged by small parts of parishes being added to the Borough.

(4) The Parish of Walsworth has been merged into the Parish and Urban District of Hitchin.

(5) Watford Urban District has been created a Municipal Borough. Its area as an Urban District had been enlarged, and the Borough has been extended recently.

(6) Welwyn Garden City Parish has been created.

(7) The Parish of St. Andrew Rural has been merged into the Parish of Hertingfordbury.

(8) Rickmansworth Urban District has been enlarged.

Middlesex and London.

Maps of the other Home Counties will follow, to complete the metropolitan area, but we do not propose to include maps of Middlesex and the County of London in the series, as practically the whole of these two counties is covered by statutory powers for the supply of electricity, the list of undertakers concerned being given below. All of them own generating stations, except those marked with an asterisk.

Local Authorities.

§Kensington and Notting Hill Joint Station. (Bulk supply only.)

Traction.

The most important tramway and railway generating stations in the London and Home Counties Electricity District are the following:—

Name of station.	Owned by.
Greenwich	L.C.C. Tramways Dept.
Lots Road	London Electric Railways.
Wood Lane	Central London Railway.
Neasden	Metropolitan Railway.
Park Royal	Great Western Railway.
Stonebridge Park ...	London, Midland & Scottish Railway.
Wimbledon ...	Southern Railway.

The following particulars in respect of these counties have been obtained from the Census of 1921:—

Acres.	Persons	Resident families.	Buildings not containing dwellings.
223,542	5,737,525	1,419,334	51,968

Electricity Supply in the Counties of Hertfordshire and Essex.

The Quality of Steam.

The Importance of the Production of Clean, Dry Steam.

By E. W. DICKINSON.

Steam is usually considered to be a gas which can be heated, compressed, expanded, &c., in conformity with well-known laws. It may also, and with equal correctness, be looked upon as essentially a vehicle for heat energy, and with this idea in mind the steam engineer should see to it that, so far as is humanly possible, it conveys to his steam engine or turbine nothing else.

The miller of old—who wore a white hat—carefully sifted the bran from the flour after grinding, in order to deliver good flour to the baker, and the distinguishing mark of a true craftsman all the world over is that the article he produces is fitted for its intended purpose and is perfect of its kind. The steam engineer is no exception to this generalisation, and should, therefore, see to it that his steam engine or turbine is fed with steam free from moisture and every form of impurity.

It is curious how casual an interest is taken in a subject of such importance as the production of clean dry steam. This is to be regretted, especially when it is remembered that as a conveyor of heat its value falls quite remarkably when it contains even a small quantity of moisture. A pound of steam, for instance, at 212 deg. F. containing 5 per cent. of its weight in moisture shows a reduction in heat-carrying capacity of over 4 per cent. as compared with dry steam, while at 215 lb. absolute pressure the drop, though less, is still about 3½ per cent. (see Table I). But when

TABLE I.

Steam		Total heat in 1 lb. dry steam from water at 32° F.	Total heat in 1 lb. 5% wet steam from water at 32° F.	% drop in heat value.
Press. lb. per sq. in.	°F temp.			
14·7	212	1,150	·95 × 1,150 = 1,032 ·05 × 162* = 8 Total 1,100	4·35
215	388	1,199	·95 × 1,199 = 1,139 ·05 × 361* = 18 Total 1.157	3·5

* Heat in liquid form 32° F.

consideration is given to the small quantity (25 per cent.) of the total heat of steam converted into work in the more economical of our large turbines, as compared with the large amount—75 per cent.—almost wholly lost through transfer to the circulating water *via* the condenser, it will be realised that the *usable* heat energy in any given quantity of dry steam is reduced by about 14-16 per cent. when it contains 5 per cent. of its weight in moisture. In other words, as a carrier of heat to be converted into useful work, by means of a modern turbine, steam suffers, by the introduction of 5 per cent. moisture, a diminution in usable heat capacity of about 14-16 per cent.; and this reduction may, when using uneconomical steam plant, amount to 25 per cent. or even 30 per cent. The practical effect of this is that within small limits the weight of the water pumped from the condenser on any given load increases proportionately with the increase in moisture and with the consequent increased drop in usable heat energy contained in the steam fed to the prime mover. The figures obtained on steam consumption trials using wet steam should therefore be regarded with caution and with knowledge of the moisture content of the steam used. Many of the exaggerated claims made years ago, and still made, as to the economies to be effected by the use of superheated as compared with saturated steam, may be traced to a lack of knowledge of the quality of the non-superheated steam used.

It may here be pointed out that wet steam, and the apparent increase in steam consumption due to its use, does not imply loss in fuel. It means simply that the heat generated by the combustion of the fuel has not been transferred to the mixture of steam and water in such quantities as to convert the whole of it into dry saturated steam. The steam leaves the boiler burdened with moisture and impurities, condenses freely with the slightest drop in temperature, finds its way out of pipe joints and valve spindle packings to the despair of the responsible engineer, and finally calls for careful rejection to the hotwell through steam traps. Here it usually increases the alkalinity and total solids content of the boiler feed water.

Where steam is used for heating liquids, as is the case in many industries, its quality must be carefully watched. In the process of dyeing, for instance, it is a matter of concern to raise the temperature of the contents of the dyeing vat with a minimum increase in liquid volume. Wet steam not only unduly increases this volume, as compared with dry steam, but invariably carries over with it other objectionable matter.

Steam can, of course, and usually is, dried by superheating. The dirt is released it is true, but in so finely divided a state that it remains in suspension to be carried forward and deposited later in heated fluid or on steam pipe, valve, or turbine blading surfaces. We are on safe ground in attributing dirt in steam to original moisture, and it is consequently useful to consider how wet steam comes about and how it may be avoided.

Wet steam is steam containing a quantity of unevaporated water projected by small bubble explosions into the steam space either in a fine cloud or in mass (priming) by and in contact with dry saturated steam. It is usually traceable to one or more of the following causes:—

(1) Restricted water surface.
(2) Restricted steam space.
(3) Defective circulation.
(4) Excessive evaporation.
(5) Dissolved matter in boiler water.
(6) Sudden and abnormal steam demands.
(7) Dirty (solid particles) or cold feed water.

The first three causes can only be removed or rendered less manifest by careful boiler design, having regard to the conditions under which the boiler will eventually operate. The care exercised as to the state of the feed and boiler water in a large modern power station is not, for instance, observable on the fringes of the Empire; but even under most favourable conditions it is sad to relate that responsible engineers are not infrequently faced with laxity in design. Too little attention is given to the fact that 60 to 70 per cent. of the total evaporation occurs in the first three or four rows of the tubes nearest the furnace; and, in the consideration of the need for great freedom of boiler water circulation, involving as it does the avoidance of counter currents, much more time might profitably be spent. As to the four remaining causes, dependent as they must be to some extent on design, they are within the control of the operating engineer who, if wise, will early find the limit of output of each type of boiler under varying degrees of boiler water alkalinity and varying amounts of dissolved solids. Only by constant laboratory tests and regulated blowing down of the boiler will he keep within these limits and obtain maximum efficiency. The tendency to prime, it has been found, is not so high on the slightly inclined water-tube type of boiler as on the more vertical type, using boiler water of the same alkalinity and total dissolved solids; but this is not to say that in all respects the slightly inclined water-tube type is the better boiler.

However, when every precaution is taken with the best of boilers, managed in the best of ways, perfectly dry steam cannot be found. In the Lancashire and Galloway types, having ample steam space and water

surface, the moisture at rated output may be taken to vary from 2 per cent. to 4 per cent. under average practical conditions, whilst with certain types of water-tube boilers anything from these figures to 10 per cent. or 15 per cent. wet steam may at times be found.

The right thing to do obviously is to try to leave the moisture behind in the boiler. Many devices have been suggested and tried with more or less success, from the extra boiler steam drum set well above the working drums, and receiving steam from the quieter of them, to the baffling or centrifugal separator. No doubt the part played by the superheater makes less obvious the need of drawing from the boiler just prior to delivery to the superheater, steam free so far as is possible from moisture. The miller, already referred to, was careful to sift the bran from the flour before dispatch to the baker. So by elimination of moisture in the early stages of steam production, unpleasant incidents, such as choked superheater tubes and later on turbine blading, &c., can be avoided. It is a more than doubtful course so to design a boiler as to make the production of wet steam almost a certainty and then leave it to the superheater to carry on the evaporation. A demand is made on the superheater alien to its function; its capacity is reduced, and an inroad is made into the productiveness of capital.

It is indeed in the consideration of capital use or expenditure that we find ourselves seriously engaged, for could a boiler be designed to produce perfectly dry steam, its capital value would be enhanced directly in proportion to the percentage drop in moisture. Let us take a water-tube boiler having a capacity of 30,000 lb. evaporation per hour, not fitted with a superheater, and costing complete with buildings and accessories £10,000, and assume it evaporates on load steam of the reasonable figure of 94 per cent. dry, and that this degree of dryness by some means, say, by redesigning the boiler or installing a steam dryer, could be brought to 98 per cent. There would then be a distinct gain of 14 to 15 per cent. in the usable heat energy delivered to the steam engine or turbine. In other words, the value of the boiler-house equipment would be increased by £1,500 because its capacity for doing useful work at any selected time had been extended in this proportion.

Now money spent on boiler-house plant may safely and fairly be taken as subject to redemption and interest at a total rate of 11 per cent. per annum; £165 per annum represents either an important saving, if considering a new layout, or a useful addition to the power of the plant, if already installed; and this sum does not include the value to be given to greater freedom from dirt and breakdown in the prime mover and its auxiliaries.

Even if we take a boiler unit supplying superheated steam, the same arguments apply, since the resultant steam is passed forward to the prime mover at a lower temperature when the boiler steam is wet than when it is dry, since part of the superheater acts as a boiler. The heat carried away by each pound of steam to the prime mover will be decreased in proportion to the extent the superheater is overworked. Consequently the useful heat energy conveyed per lb. of steam will be diminished as in the case of saturated steam, and the boiler plant will in a similar manner suffer loss in capacity.

In conclusion, it can fairly be stated that, whether a high quality of steam is obtained by having regard to suitable boiler design, particularly in the matter of good circulation; by careful attention to alkalinity and chlorine content of the boiler water; or by steam baffling or some form of steam separator fixed within or near the boiler steam space, thereby eliminating moisture and its co-related dirt—a return well out of proportion to the thought and care given, or expenditure made, may confidently be looked for.

Notes on Engineering Education.

College and University Technical Societies.

(Communicated.)

No technical college or university is keeping abreast of progress if it does not possess its own engineering society. Fortunately, most of them have such societies, and very bright and sparkling are their doings; for the student engineer may be permitted a liberty of speech and action denied his sober elders in their membership of the great engineering institutions of the country, and he can travel paths and pursue lines of action that will only present themselves during his college days. The value of a properly-organised engineering society to a student, from an educational point of view, is incalculable; it presents opportunities for gaining knowledge which can never be obtained in the lecture theatre, and full advantage should be taken of them. The society should be organised, financed, and controlled by the students themselves, and new students should join it as a matter of course, thus ensuring that the loss due to students passing out is continually being made up.

The main features of the work of the society should be papers, lectures and discussions, and visits to works. The reading of papers and the discussions thereon are of the utmost importance. Practically all the papers should be written by the students themselves, and the practice of asking outside authorities to read papers on their pet subjects should be strictly limited. It is the student himself who wishes to gain knowledge and information, and it cannot be too often emphasised that the man who learns most from an engineering paper is the man who writes it. Outside advice and assistance should not be entirely shunned, however, for they can render very valuable aid. It is quite a good plan to invite one of the lecturers or professors to occupy an honorary position in the capacity of a president, so that his advice and experience are always available. A man rich in learning and young in spirit (one who has not forgotten his own student days) will prove the best "father" to the society. Then, again, whilst outside contributions should be definitely restricted, they should not be excluded altogether. A good lecture from one who is an authority on some subject will be a change, and should also stimulate students to still greater efforts.

As stated above, the man who learns most from a paper is the man who has written it: the man who sits and listens—and does nothing more—learns very little. The amount of work involved in writing a paper is remarkable, and is known only to those who have done it. The theories that are checked, the problems solved, the dozens and dozens of references which have to be made, are unknown to him who merely listens; but even more important to the general body of students is the discussion which should follow the paper. Here the opportunity is equal for every man, and every man may make what use he desires of that opportunity. It is in the time occupied in the discussion of a paper that a student will obtain the best return for his membership of the society. Discussion and argument, even though it reaches no definite conclusion, does ensure that a point is viewed in a variety of ways, and, generally speaking, a good discussion means that a problem is attacked from every possible angle.

The discussion on a paper has an even greater value

than the dissemination of technical information; it provides the student with an opportunity to gain confidence in his own voice. The value of confidence in one's own power of speech cannot be expressed in mere £ s. d. It is the key to the enchanted land; it enables one to enter realms otherwise closed; it is the "Open, sesame" to the higher walks of the profession. How many men are there, brilliant men, men of high intellect, who occupy subsidiary posts to-day at £400, £300, and even £200 per annum when they ought to be getting as many thousands, because of their lack of confidence in themselves, and their betrayal of that lack of confidence in their manner and speech? Their number is legion! Both in this country and in America numbers of men command a good income by providing courses, wonderful and fearful systems most of them, which will enable you to "Overcome your nervousness," and "Gain confidence in yourself." These are direct and striking evidence of men's inability to express themselves clearly, forcefully, and emphatically. In our great profession of engineering such qualities are absolutely essential. Therefore, Student, discuss, argue, query; get used to expressing your opinion in front of others; do not be afraid to ask questions; be prepared always to challenge dogmatic assertions. But in all, let your language be simple and accurate, and your manner modest whilst emphatic.

That part of the society's activities concerned with visits to works is of almost equal importance, especially if full advantage be taken of the opportunities they offer a student for adding to his store of knowledge. For many students the works visits of the society constitute their initiation into that mysterious world where are carried on the practice and application of the principles they are taught in the lecture room. Very often they do not realise the enormous privilege they enjoy. They are honoured guests; their hosts are ready and willing to explain anything they wish to know; the whole organisation of a manufacturing concern is open to their inspection. It may not always be so, therefore it behoves each man to make the most of his opportunity. Most value can probably be extracted from a works visi if a serious effort is made to line-up the practice o the shops with the theory of the lecture room. Th student should be specially on the watch for differen methods of applying theoretical reasoning. The prin ciples underlying manufacturing operations should b noted, and mental correspondence made with th lecture-room treatment of the subject. Any apparen deviation from basic principles should be speciall noticed and the reason sought. In short, a works visi is something more than an afternoon's outing, an only if it is taken seriously will full value be obtaine from it.

It should be the aim of every student to make hi education as wide as possible. Specialisation is good but even a specialist is of more value if he has a goo knowledge of the correlative branches of his subject Therefore, in addition to joining the society connecte with his own particular branch of science, I woul suggest that the student join another society also Many, for instance, in addition to engineering, ar interested in chemistry; some are keen geologists mathematics attracts others. Thus the student coul join the Geological Society or the Chemical Society, o whichever branch he felt inclined to cover. A society dealing with English literature is often welcomed b engineers, for the change in the direction of thought and study from engineering to literature often prove highly beneficial to the hardworking student. B joining one of these other societies a student is brought fairly constantly into touch with matters outside hi own immediate sphere, and yet related to it. Thus there is less danger of engineering occupying a distorted position in the mind of the student; an ever-present danger under conditions of intensive study.

Whilst the technical society should be one of the distinctive features of an engineering student's college training, he should remember that definite exertion on his part is necessary; that he will only reap benefit from it as he puts effort into it.

Scientific and Industrial Research.

Report of the Committee of the Privy Council.

Last week the report of the Committee of the Privy Council for Scientific and Industrial Research was issued. (Cmd. 2491; H.M. Stationery Office. Price 3s. net.) It states that the estimated outlay for the year 1925-26 is £380,263, compared with £328,281 last year, and £276,863 for 1923-24. To fill the vacancies created by the deaths of Sir George Beilby and Sir Maurice Fitzmaurice the Committee has appointed Sir William Ellis, G.B.E., and Dr. J. H. Jeans, secretary of the Royal Society, to be members of the Advisory Council. The Department has incurred increased responsibilities due to its closer contact with important questions of Government policy, the natural outcome of the efforts of successive administrations towards the better co-ordination of scientific work done for the State, and of the growing appreciation on all hands of the contribution that science can make to the solution of the difficult problems of modern administration and economic reconstruction.

The Department has been studying the low-temperature carbonisation of coal on a "works" scale for seven years, and the cost of the Fuel Research Station has amounted to over £400,000; though the production of smokeless fuel, fuel oil, &c., in this way has not proved to be commercially profitable, it is claimed that results have been obtained in other directions which have brought profit and savings to industry and the nation exceeding the above expenditure. Science alone, it is maintained, cannot save industry from its present troubles, but it can help by making many small improvements in existing practice.

The trade depression has borne hardly on many of the existing research associations, and help has been given where necessary to keep them in existence in the hope of placing them on a permanent footing when prosperity returns.

The survey of the coal seams of the country is proceeding satisfactorily, and four tests have been made of full-scale plants for low-temperature carbonisation, &c., belonging to private owners. Arrangements are being made for the intensive study at the Fuel Research Station of the problem of obtaining liquid fuels and other oils from coal under high pressures at moderate temperatures.

During the year 28 applications for patents have been filed by the Department, and six have been allowed to lapse. The new ones cover improvements relating to cathode-ray oscillographs, radio-telegraphic direction-finders, selective devices for radio-telegraphic reception, sound-absorbing plasters, means for determining impurities in gases, &c.

The expenditure of the National Physical Laboratory during 1924-25 amounted to £173,455. Of this sum £50,004 was provided by fees for tests and special investigations for outside firms or by contributions of co-operating bodies, and £29,965 from repayments from the Service departments for work undertaken directly for them.

The expenditure on fuel research during 1924-25 amounted to £50,471, of which £37,050 represents the cost of work carried out at the Fuel Research Station. Receipts from testing fees and the sale of by-products amounted to £2,285.

The expenditure of the Department incurred on the recommendation of the co-ordinating research boards and their committees during the year 1924-25 amounted to £24,077, while researches costing £27,252 were undertaken for these boards and committees at the National Physical Laboratory.

There are at present 21 industrial research associations in active operation. Grants to associations for the financial year ended 1924-25 amounted to £100,118, and the balance of the Million Fund remaining unexpended on March 31st, 1925, amounted to £518,200. A substantial part of this balance will be required to complete the payment of grants to associations which have not reached the end of their first grant periods, and for the payment of additional grants promised to certain associations that have completed their first quinquennia. From the balance provision must also be made for new research associations that may be formed hereafter.

The income derived from the interest of the unexpended balance of the Million Fund amounted during the year to £38,669. From this income, expenditure amounting to £10,065

vas incurred on industrial research, and the surplus, £28,603, vas applied towards the cost of research work of value to ndustry generally, for which purpose it was appropriated in id of the Vote of the Department.

During the academic year 1924-25 258 grants were made o research workers and students-in-training. Of these 193 vere allowances to students to enable them to take advantage f the facilities in training in research afforded by various niversities and colleges or other research institutions, 47 were ersonal grants to research workers to undertake independent esearch or to act as scientific assistants to other investigators, nd 18 were personal grants to scientific workers to enable iem to employ laboratory assistants or to purchase equipment. he total expenditure on these grants during the year is esti- ated at £35,000, as compared with £40,820 during the ademic year 1923-24. The expenditure during the financial ear 1924-25, covering half of each of these academic years, as £37,523.

The expenditure of the Department on headquarters admini- ration during the year was £35,920. The total expenditure the Department during the year was £539,199. This sum as made up of £311,286 from the Exchequer, £38,669 from ie interest on the Million Fund, £100,118 from the capital t the Fund, and £89,126 from fees for tests and special ivestigations for outside bodies, &c.

The Report of the Advisory Council to the Committee refers, *ter alia*, to the approaching completion of the new chemical boratory at Teddington, the new building of the National hysical Laboratory for the high-pressure transformer, and ie commencement of a Physics Laboratory building. It is ggested that the facilities of the Department for the conduct research likely to lead to results of benefit to industry e not sufficiently widely known; "the Department is pre- ired to consider any suggestions for the conduct of research any of its stations, provided the results are likely to be of neral scientific or industrial interest." The Department is prepared to arrange for research to be undertaken in its vn laboratories on behalf of industries on the same terms it offers to research associations"; and "it is willing to rry out on suitable terms special investigations of scientific industrial interest for any outside body or person," when cilities for the work do not exist elsewhere. The charges ade will depend upon whether the results are or are not ade available for publication.

Investigations on the production of intense magnetic fields ve proved of general scientific interest, and have been under- ken under the direct supervision of the Council; a grant has en made to Sir Ernest Rutherford for the construction of ecial apparatus for the purpose, which is being installed the Cavendish Laboratory.

The Radio Research Board is an effective centre for the co- dination of research required for Government purposes, d for the discussion of general radio problems of funda- ental importance. It is now considering the best type of ve for direction-finding at sea, and has done valuable work connection with the theory of propagation of waves. The gineering Research Board has extended the work on the operties of materials at high temperatures; the results have en extremely promising, and the Board will co-operate with e Non-Ferrous Metals Research Association in a general ack on the subject, under a special committee. Arrange- nts are being made for the co-ordination and extension of rk on electrodeposition. Progress has been made with the eliminary programme of research on illumination, and addi- nal facilities are to be provided at the N.P.L. to enable comprehensive programme of work to be prepared. The vestigation of the Severn Barrage scheme was delayed by e death of Sir Maurice Fitzmaurice, but eventually his firm s appointed to act with Sir John P. Griffith, and the com- ttee has reported to the Committee of the Privy Council.

The scope for electrical research, says the report, is almost thout limit. "The British Electrical and Allied Industries search Association, as evidenced by the review of its acti- ies by independent scientific experts, is carrying out admir- le work for the industry, although its sphere of usefulness the wide field it has to cover has naturally had to be stricted to correspond with its comparatively limited re- urces. We have recommended further grants to this Associa- n based on a total expenditure of £16,000 per annum. We ognise, however, that this sum represents only the bare nimum required to keep the Association in active existence, d that it in no way represents the amount required to able the Association to meet effectively the demands that y properly be made upon it. If therefore the Association prepared to embark on a more extensive scheme of work in next few years, we would give every encouragement pos- le, and we have indicated our willingness to consider sym- hetically any application the Association may wish to make a limited measure of further grant from the Government h this end in view."

With regard to grants to individual research workers, the ncil says: "Only when local industry, local education, l every other local activity are linked up with and sup- ting research will science make her greatest contribution the life of the nation. We are, therefore, glad to be able record a very real increase in local support for post-graduate search during the past ten years."

Rules have been approved by the Committee under which pendent members of research boards and committees will future be appointed for not more than four years, and will be ineligible for reappointment for one year. Chairmen will be appointed for five years.

In addition to summaries of the work done by the N.P.L., the Fuel Research Board, and other Research and Co-ordinating Boards, there are nine appendices giving the personnel of the Boards and Committees of the Department, statements of grants made, lists of researches, statements of expenditure, particulars of Research Associations, research developments in Dominions, lists of publications by persons in receipt of grants and papers by the scientific staffs of the Services, and a list of departmental publications issued during the year.

Electrical Power Engineers' Association.

Annual Dinner.

The annual dinner given by the E.P.E.A. (Southern Division) to the members of the National Executive Council, was held at the Hotel Cecil, London, on Saturday last. Mr. A. E. Ricketts presided, and there was a record attendance—about 350 members and guests.

After the loyal toast, Col. Wilfrid Ashley, M.P., Minister of Transport, proposed "The Association," expressing cordial approval of the two chief objects of the society—the general advantage of the industry, and the improvement of the status of engineers. There would be an enormous increase in the use of electricity during the next few years; whilst we consumed only 200 units per head per annum, in other countries the rate was 800 or 900 units. Some thought that such increase would be at the expense of a rival commodity, but there was room for many forms of heat and power, and the electricity and gas industries had progressed together. The electrification of suburban railways, he hoped, would be followed by that of the main lines, and the supply of electricity would be quintupled in 12 or 14 years. Great opportunities lay before the members. The public services increasingly relied on electrical energy, and he was confident that the Association and its members would remember their responsibility towards those services and to the whole country.

Responding, Mr. R. R. Telford, president, said the Association was a trade union of great power, as all the big generating stations were controlled by its members; but increased power brought with it enhanced responsibility, which was realised by them. To-day there was complete accord between them and the employers; an arbitration clause had been agreed upon two years ago, but no disagreement had arisen during that period. Given reasonable men and reasonable employers, the Whitley system might avert many catastrophes. They were proud of the Association and its principles, and grateful to the employers' representatives on the National Joint Board, especially to Ald. W. Walker, for the great help they had rendered in developing the scheme for training power engineers. He concluded with thanks to the National Executive Council for its excellent work and to the Southern Division for the admirable entertainment it had organised.

Mr. A. J. Ostler, making a presentation to the immediate past president, Mr. T. A. G. Margary, spoke of the burden of duties which he had borne on behalf of the members, and the great interest he had shown in the scheme of training. The presentation took the form of a silver coffee service, with a gold slave bangle for Mrs. Margary. Musical honours were accorded to Mr. Margary, who, in returning thanks, said the Association had up to now been preparing the way and had hardly begun its real duties; its ideal was "Service," and it had seized upon the Whitley system as the only means of ensuring peace in the industry. With the collaboration of the employers a scheme of training for power engineers was about to be launched. It was their intention to include all men on the technical side of the industry in one professional Association, from the chief engineer to the lowest trainee.

Sir John Snell, G.B.E., chairman of the Electricity Commission, proposed "The Electricity Supply Industry," and contrasted the conditions of 40 years ago with those obtaining to-day; in this country 8,000 million kWh was now generated annually, and the rate of increase was 15 per cent. There was every indication that in the years immediately to come there would be very great development, and it was of great satisfaction to him to know that the members of the Association were imbued with a sense of their responsibilities and a full intention to carry out their duties and pull their weight. Congratulating Mr. R. A. Chattock on his taking up the duties of president of the Institution of Electrical Engineers, Sir John referred to the many interests of that body and expressed the view that electroculture, which had been found to add on the average 33 per cent. to the yield of corn—sometimes as much as 80 per cent.—was going to be of great service to mankind.

Mr. R. A. Chattock, responding, said the great developments of the past 40 years had been brought about by the technical staffs, and the rate of progress now was even greater than it was 10 or 15 years ago. It had been uphill work for a young industry in competition with big vested interests, but there was room for both. There were signs that gas and electricity were becoming more friendly—that would afford a solution to the problem. The Association should do all that it could to work hand in hand with the gas industry; thus more perfect combustion of fuel could be achieved, and they would

benefit by the experience gained by gas engineers during the past 30 or 40 years. It was important to increase the load factor of electricity undertakings; the average here was from 20 to 30 per cent., but in the United States 45 to 50 per cent. was commonly attained, largely due to the supply of electricity to railways and collieries, which had 24-hour loads. He hoped that railway electrification would come *soon*, as it would benefit all classes of users of electricity. They had reduced generating costs, but the cost of distribution was going up, and that problem should be studied carefully, especially in rural districts, where otherwise it might be greater than consumers could afford. The educational work of the E.P.E.A. was very valuable; the training of qualified electrical engineers was most important, as they must be prepared to move up into higher positions as time went on. Chief engineers should exercise discretion and sympathy in dealing with the older men, who could not be expected to pass examinations; tolerance would smooth the way for both young and old.

Mr. W. J. Oswald proposed "The Visitors," and Ald. W. Walker, responding, said the two sides of the National Joint Board had arrived at an understanding, and the realisation of the scheme of training was close at hand. That would show that the Board had a higher ideal than salaries and working conditions—namely, that of improving the training and status of engineers, thereby benefiting the nation, the industry, and the individual.

During the evening a full programme of song and story was performed, and the chairman took occasion to put on record the gratitude of the assembly to those responsible for the entertainment, above all to the hon. secretary, Mr. Hyatt.

Legal.

Nikola Tesla Patents.

Mr. Fletcher Moulton applied to Mr. Justice Tomlin in the Chancery Division on October 13th, for permission to withdraw a petition to extend the period of the patents taken out by Nikola Tesla in 1910. The petitioners were in America, he said, and he asked for the petition to be withdrawn but without prejudice to the presentation of a petition for extension on account of war losses.

Mr. Dighton Pollock (for the Board of Trade) said that his department had received no notice of the application. No accounts had been filed and there was no evidence of any kind.

His Lordship said he did not understand what was meant by withdrawing a petition. If Counsel consented to have it dismissed then there was an end of it.

Mr. Fletcher Moulton consented to have the petition dismissed, and this was done.

Radio Instruments, Ltd., v. Dawson.

Mr. Justice Tomlin in the Chancery Division on October 13th had before him an unopposed motion by Radio Instruments, Ltd., for an injunction restraining George Dawson, of Balls Pond Road, N., from selling the applicants' transformers at less than the stipulated price.

Mr. Shelley said defendant had agreed to submit to a perpetual injunction and to pay the taxed costs of the proceedings.

Radio Instruments, Ltd., v. Charles & Co.

In the Chancery Division on October 13th, Mr. Justice Astbury granted an injunction restraining Charles & Co., Mare Street, Hackney, from infringing a patent of Radio Instruments, Ltd., by selling the latter's radio transformers in breach of the terms of a limited licence as to price.

Mr. Shelley, appearing for the plaintiffs, said a letter had been received from defendant saying he did not propose to attend and in these circumstances Counsel moved *ex parte*. He explained that the terms of the licence which were printed on the box containing the transformer specified that the price at which the article was to be sold should not be less than 25s. The defendant had been selling at various prices and had sold one transformer at the price of 19s. 6d. instead of 25s. The article was bought by an employé of the plaintiffs who saw it in defendants' window.

An affidavit by Mr. Appleton, a director of the plaintiff company, setting forth the terms of the licence, was read, and his Lordship, in granting the injunction, suggested that the plaintiffs' solicitors should see the defendant with a view to his agreeing to have the injunction made perpetual.

General Radio Co., Ltd., v. Kear.

A King's Bench Divisional Court, comprising Mr. Justice Salter and Mr. Justice Fraser, recently dismissed an appeal by the General Radio Co., Ltd., the plaintiffs in a claim against Ernest Kear, a wireless expert, of Clifton, Bristol, for £25, the price of a receiving set. The defendant contended in the Westminster County Court, where the claim was heard, that the set was not according to the description under which it was sold by the plaintiffs, and that he had rejected it as he was entitled to do within a reasonable number of days. The County Court judge took this view and gave judgment for the defendant. The plaintiffs appealed on the ground that there was no evidence upon which the learned judge could find that there had been rejection of the set, and Mr. Humfrey Edmunds, their Counsel, argued before the Divisional Court that the defendant had accepted the instrument.

Mr. T. Simpson Pedler, for the defendant, said that his client stipulated for seven days within which he could approve or disapprove of the instrument. The article did not give satisfaction: he said he could not get signals from certain places and could pick up only Cardiff. Therefore he rejected the set.

Mr. Justice Salter said the question for that court was not the quality or capacity of the instrument but whether there was notice of rejection. There was ample evidence on which the learned judge could find that there was unequivocal rejection within a reasonable time.

Mr. Justice Fraser agreed.

Unsuccessful Customs Prosecution.

The Times reports the hearing of a summons before the Lord Mayor at the Mansion House on October 15th. The matter was one in which the Board of Customs summoned Ernest A. Moses, of Warwick Court, Holborn, for having, in a statutory declaration, made a false statement as to the value of certain wireless valves, contrary to the Customs Consolidation Act, 1876. Defendant pleaded "Not Guilty."

On behalf of the Customs authorities it was stated that the case related to the importation of 400 wireless valves from Belgium by the G. and L. Electric Supply Co., Ltd., of Warwick Court, of which the defendant was the secretary. The valves were made in Vienna. The defendant represented the value as £28 15s., on which the import duty would have been £9 10s. 8d. It was alleged by the Customs that the real value was £61 or £62, on which the duty would be £20.

Solicitor for the defendant said that the Customs had detained the goods since January last, and it was only on the threat that legal proceedings would be instituted for the recovery that this prosecution was launched. The declaration gave the actual purchase price in Belgium. The defendant was merely secretary to the company, and knew nothing of the circumstances.

The Times states that evidence as to these statements was given after which the Lord Mayor dismissed the summons allowing the defendant ten guineas costs.

Bauxite in France.—French bauxite is discussed by a French economist in a series of articles published in Paris (*L'Information*). Confronted by the development of the industry in other countries, he states that the French industry is energetically defending itself. After the falling off of the production during the war, the output, which declined in 191[illegible] to 56,000 tons, or one-sixth of that in 1913, recovered to 186,000 tons in 1920, and to 314,000 tons in 1923, and rose to 389,000 tons in 1924, or a total greater than in any previous year. Similarly the exports, which were 168,000 tons in 1913, reached 130,000 tons in 1921; 166,000 tons in 1922; 192,000 tons in 1923; and 202,000 tons in 1924. These results are considered to testify to the high quality of the ore and to a commercial organisation which many industries might envy. As to the production of the raw metal, it is mentioned that France turned out 13,500 tons of aluminium in 1913, but since the end of the war the output capacity has been increased, and further water power is to be utilised for developing the industry. According to researches made by M. Suhr, of the Compagnie d'Alais, Frogés et Camargue, the world's production in 1923 amounted to 163,000 tons of aluminium; in 1928 or 1929 the world output might be 200,000 tons, when France would be able to make about 50,000 tons or 25 per cent. of the aggregate. The quantity of bauxite required would be 500,000 tons per annum, which tonnage is claimed to be capable of being maintained for many years. In fact, having regard to the circumstance that the deposits are now known to be more extensive than had been assumed to be the case, it is contended that France has bauxite resources which will last for a century, if not for two centuries. Under the circumstances, it is held to be unnecessary to conserve the existing resources excessively for a distant and problematic future. On the contrary, the question is to favour the exchange and the sale of heavy materials, so that there should be no idea of export vetoes or even restriction of exports. It has been contended that the Lorraine iron ore industry is unable to exist without an intensive production, supported by continuous exports, and this will be true to-morrow in the case of the modernised bauxite industry. The State has performed what was considered to be impossible with regard to satisfying the requirements of the producers of iron ore in the region of Briey, and it is considered that the moment would be ill-chosen for treating those of the Herault and the Var in a different manner.

Proposed Institute of Wireless Engineers.—After obtaining the views of several highly placed wireless engineers, it has been decided to hold a general meeting in London on October 31st, with a view to discussing the advisability of continuing with the proposed British Institute of Wireless Engineers. The chair will be taken by Mr. James Nelson, M.I.E.E., who is an ardent promoter of the scheme. Persons interested may attend the meeting and particulars can be obtained from the temporary hon. secretary, Mr. Y. W. Evans, 66, Oxford Road, Manchester.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities New Publicity Literature, Liquidations and Failures.

Insulated Wire for Uruguay : The Contract Date.—Our orrespondent writes :—" The invitation extended to manufacurers of electrical supplies by the Administracion General de as Usinas Electricas del Estado de Montevideo for a first conignment of 1,060,000 metres of insulated copper wire should raw attention to the possibilities of this field for supplies; itherto it has been almost neglected by British manufacurers. Unfortunately, the time, namely, December 28th, llowed for sending in bids, is almost too short to enable 3ritish exporters to tender (unless by cable); but inasmuch s it is understood that this order for copper wire—large as it s—is only a preliminary one, it should be worth the while of xporters of electrical goods generally to get into communicaion with the Administracion General at Montevideo, since in ts hands are lodged nearly the whole of the electrical industries n the Republic."

New Municipal Showrooms.—Premises to be erected in it. Stephens Place, Chesterfield, are to be rented at £130 er annum by the Chesterfield Corporation for the purpose of lectricity showrooms.

The new Southport electricity showrooms at the Glaciarium, ord Street, were opened by the Mayor on October 19th.

British Industries Fair.—We learn that the eleventh 3ritish Industries Fair, to be held in London and Birmingham rom February 15th to 26th next year, promises already in nany ways to be the most successful, interesting and represenative fair of the series. Although forms of application for pace have been in the hands of potential exhibitors only a ew days, over 100,000 square feet of space has already been pplied for, and new applications are being received daily by he secretary of the Fair. No doubt many firms realise the dvantage of exhibiting in a fair, on the advertising of which he Government has decided to expend £20,000 in a wide-orld publicity campaign. The charge for space has been educed this year at both London and Birmingham; the harge in London is 2s. 6d. per square foot. Early last week pplications had been received from over 110 different firms equiring space at the London section.

Important Indian Railway Contract.—It is reported that he Government of India has sanctioned the electrification of he Bombay-Igatpuri-Poona lines of the Great Indian Peninsula ailway, about 300 track miles. An expenditure of £5,000,000 s anticipated, and it is said that the whole of the machinery nd plant will be obtained from the United Kingdom.

The Shannon Scheme Dispute.—Work upon the Shannon ydro-electric scheme is still held up by the refusal of the abourers to accept the terms offered by the contractors—the iemens-Schuckertwerke. A number of unfortunate " incients " have occurred in which German workmen and officials ave been assaulted. The Limerick Water Works Committee as refused to supply water to the German vessels, containg materials for the scheme, which are lying off the city. he Government is apparently taking no active steps to end he dispute, but there is some talk of mediation by an outside ody.

Better Lighting.—The General Electric Co., Ltd., Magnet louse, Kingsway, W.C., has issued for the use of electrical ealers a brochure entitled, " Osram More Light Recommenations," and containing a reproduction of " Osram " trade dvertisements directed to selected lighting spheres within the cope of the electrical contractor. The illustrations and matter et forth the case for the modern lighting of the shop window nd the home, offices, workrooms, factories, &c. It also overs decorative lighting, out-of-door lighting, floodlighting, nd electric sign advertising, and provides the dealer and conractor with a reminder of the wide and varied field for xploitation and development that lies to his hand.

Sydney Power House Contracts.—The electricity supply ommittee of the Sydney City Council has decided, says the *ydney Morning Herald*, that in the matter of tenders for the achinery and equipment for the City Council power-house, ll Australian firms should be free to tender, but that " tenerers must submit with their tenders a statement setting ut briefly the experience and facilities at their disposal for arrying out works of the magnitude and nature of the items ndered for." Previously a resolution had been passed by he City Council to the effect that firms tendering should ow that they had manufactured and had had working for at ast 1,500 consecutive hours, machinery within 70 per cent. f the magnitude of the machinery tendered for. This reso-ution the council was asked to rescind.

" As She is Writ."—A well-known British electrical anufacturing company has recently received the following hoice communication, conspicuous more for its interest than or its clarity, from a Colonial correspondent :—" Dear Sir, I ust in forming you this few short of line as I had saw your ame that tell you are the man of selling bisses & I Hop at you will be Please & sent me the note book sow that I an see what I want from your Shop Sir Please & be faithlly Kind Sir I Can be very Glad if you Can Sent it for me ir & do be Please & Reply Sir I remain Your faithfully."

Lead.—Messrs. James Forster & Co., reporting on October 17th, stated :—" In face of the poor state of demand for lead on the Continent, particularly in Germany, consumption on the decrease at home and the prospect of full supplies from Australia from December onwards, it is difficult to see how present prices can be maintained for long."

British Trade Mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from the dates mentioned. In the case of foreign applications, the names and addresses of the British representatives are also given.

October 7th, 1925.

C. A. V. (lettering and design). No. 456,655. Class 6. Dynamos, magnetos, self-starters, &c., and their parts. No. 456,656. Class 8. Secondary electric batteries, electrically-fitted switchboards, ignition coils, searchlight apparatus, voltmeters, ammeters, loud speakers, wireless telephone and telegraph receiving and transmitting sets, electric regulators, contact breakers, &c., and parts thereof. No. 456,657. Class 13. Carriers for electric batteries, electric switches (ordinary), electric bulb lamps, electric light fittings, sparking plugs, electric horns, junction boxes, dashboard plug adaptors, &c. No. 460,915. Class 40. Cases of ebonite for batteries and spare parts.—C. A. Vandervell & Co., Ltd., Warple Way, Acton Vale, W.3.

Sfen. No. 460,250. All goods in Class 6. No. 460,251. All goods in Class 8. Super Selectodyne. No. 460,254. All goods in Class 6. Super Neutrodyne. No. 460,270. All goods in Class 6. Superhetradyne. No. 460,259. All goods in Class 8. Superpentadyne. No. 460,263. All goods in Class 8. Superhexadyne. No. 460,267. All goods in Class 8. La Société Radio Française, 79, Boulevard Haussmann, Paris, France. (Marks & Clerk, 57-58, Lincoln's Inn Fields, London, W.C.2.)

Excelsior. No. 461,874. Class 6. Electrical vacuum cleaning machines.—Harold E. Chamberlin, 19, Buckingham Street, Strand, London, W.C.2.

Concertome (lettering and design). No. 458,627. Class 8. Receiving sets for use in wireless-telephony and telegraphy.—William Lyons, 8, Bank Hey Street, Blackpool.

C. A. X. (lettering and design). No. 459,071. M. A. X. (lettering and design). No. 459,072. P. A. X. (lettering and design). No. 459,073. A. T. M. (lettering and design). No. 459,074. All goods in Class 8.—Automatic Telephone Manufacturing Co., Ltd., Milton Road, Edge Lane, Liverpool.

Neutroceiver. No. 461,180. Neutroceiver-Grand. No. 461,181. Class 8. Instruments and apparatus, and parts thereof, for wireless-telephony and telegraphy.—Fada Radio, Ltd., Alexandra House, 31, Kingsway, London, W.C.2.

Crystastat. No. 461,313. All goods in Class 8.—Neutron, Ltd., Sentinel House, Southampton Row, W.C.1.

K. (lettering and design). No. 461,494. Class 8. Electrical condensers.—Wates Bros., Ltd., 12-14, Great Queen Street, London, W.C.2.

Radiolux. No. 457,716. Class 8. Apparatus for the generation and application of high-frequency currents for surgical and curative purposes.—Electricitäts Gesellschaft " Sanitas," 131d, Friedrichstrasse, Berlin, N.24, Germany. (Herbert Haddan & Co., 31-32, Bedford Street, Strand, London, W.C.2.)

Aspiral. No. 461,479. Class 13. Electric incandescent lamps.—Naamlooze Venootschap Philips Gloeilampenbrieken, Eindhoven, Holland. (Boult, Wade and Tennant, 112, Hatton Garden, London, E.C.)

October 14th, 1925.

Cabtyrit. No. 460,712. Class 4. Indiarubber compounds.—St. Helen's Cable and Rubber Co., Ltd., Bath Road, Slough.

Askania (lettering and design). No. 454,548. Class 8. Electro-technical measuring, signalling, and controlling apparatus, electric cables, &c.—Askaniawerke Gesellschaft vormals Centralwerkstatt Dessau & Carl Bamberg Friedenau, 87-94, Kaiser Alle, Friedenau, Berlin, Germany. (Boult, Wade and Tennant, 112, Hatton Garden, London, E.C.1.)

Thermiodyne (lettering and design). No. 457,500. Class 8. Instruments, apparatus, and parts thereof, for use in wireless-telephony and telegraphy.—Thermiodyne Radio Corporation, 33-39, South River Street, Plattsburg, N.Y., U.S.A. (White, Langner, Stevens & Parry, Jessel Chambers, 88-90, Chancery Lane, London, W.C.2.)

Sunstar (lettering and design). No. 458,078. Class 11. Non-automatic lamps for use in light therapy.—Thomas C. Angus, " Pitreavie," Carroll Hill, Loughton, Essex.

Ferrodes. No. 460,850. Class 13. Flux-coated electrodes for use in electric welding.—Ferro-Arc Welding Co., Ltd., 12, Grosvenor Gardens, London, S.W.1.

Clemateite. No. 461,050. Class 50. Electric insulating material, consisting of asbestos and mineral substances.—Dacier, Ltd., Balfour House, Finsbury Pavement, London, E.C.2.

Trade Announcements.—The telephone numbers of the London depôt of the Cable Accessories Co., Ltd., have been changed to " Central 9028 and 9029."

Messrs. W. G. Walter and H. V. Walter have commenced business as Walter Bros., electrical power engineers, at Keward Works, Monmouth Place, Bath, specialising in arc welding, rewinding, repair, and installation work. The business is quite separate from that carried on by Mr. W. G. Walter, at Southey House, Westgate Buildings, Bath.

The Vickers Spearing Boiler Co., of which Vickers, Ltd., are the sole proprietors, will in future be known as the Vickers Boiler Co., Ltd. The management of the company will be as follows :—Mr. Douglas Vickers, chairman (chairman of Vickers, Ltd.); Sir Vincent Caillard, D.L., director (director of Vickers, Ltd.); Commander C. W. Craven, R.N., director (director of Vickers, Ltd.); Mr. W. F. Sadler and Mr. J. Kerr Bock, joint managing directors; Mr. G. T. Williamson, general manager; and Mr. Harold B. Clark, secretary. The address of the new company will be the same as before—20, Kingsway, London, W.C.2. Mr. A. H. Spearing has retired from the company.

The Igranic Electric Co., Ltd., has recently opened a new office at British Dominions House, Tramways Centre, Bristol.

Messrs. R. H. Patterson & Co., Ltd., makers of battery mine locomotives, &c., Newcastle-on-Tyne, have appointed Messrs. A. Fleming Brown and William Sharp, of 11, Carteret Street, S.W.1, as agents for the London and Southern districts. Telephone : " Vic. 6529."

Since 1919 the British Electric Plant Co., Ltd., has been closely associated with the Harland Engineering Co., Ltd., both companies having a common directorate and a unified policy. It has now been decided, for reasons of efficiency and economy, to undertake the whole of the work done by both companies, under one name only, *viz.*, the Harland Engineering Co., Ltd. This arrangement took effect as from October 1st.

Mr. A. B. Blakey has removed his offices to Daimler House, Paradise Street, Birmingham.

Messrs. James Gordon & Co., Ltd., Windsor House, Kingsway, London, W.C.2, inform us that Mr. R. B. Davies has left their service. They desire all correspondence regarding the "Duplex Mono" recorder to be addressed to them direct.

Mr. R. C. Fitzsimons has commenced business as an electrical contractor at 73, Basin Road, Chichester, and he asks for trade catalogues and price lists.

Messrs. Kelly & Co., electrical engineers and wireless experts, have opened premises at 59, North Road, Durham.

Messrs. Burnage-Epps, Ltd., of 82, High Street, and 19-23, Park Street, Ashford, Kent, have opened a department for wireless components.

Mr. G. J. Scragg, electrical engineer, of 125, Mill Street, Crewe, is opening new showrooms for electrical fittings and domestic appliances.

The Huddersfield Radio Co., of which Mr. C. W. Beaumont is manager, has opened premises at 8, King's Head Arcade, Cloth Hall Street, Huddersfield.

Messrs. Hill, Upton & Co., Oxford, have opened new showrooms, offices, and works.

Catalogues and Lists.—The British Aluminium Co., Ltd., 109, Queen Victoria Street, E.C.4.—Hints on the working of aluminium. No. 14, Aluminium Tubes.

Brookhirst Switchgear, Ltd., Chester.—An excellently illustrated booklet, outlining the history of Chester, with special reference to the company's switchgear works in the city.

Ateliers de Constructions Electriques de Charleroi, Charleroi, Belgium.—No. C.1,343, describing various designs of the company's paper-insulated cables.

Welsbach Light Co., Ltd., Welsbach House, 344-354, Gray's Inn Road, King's Cross, W.C.1.—List No. 503. Catalogue of domestic appliances, lamp shades, and other electrical accessories.

Sir William Arrol & Co. (Swansea), Ltd., have issued a handsome brochure describing their new structural works at King's Dock, Swansea. It is beautifully illustrated with coloured pictures and photographs of some of the contracts that have been carried out since the works were started up in 1923.

Messrs. Archibald J. Wright, Ltd., 395, City Road, E.C.1.—An illustrated net trade price list of wireless components, and an illustrated and priced leaflet of wireless receiving sets and accessories.

The Siluminite Insulator Co., Ltd., The Green, Southall, Middlesex.—A folder describing "Siluminite" Grade 2.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—A folder describing "Osram" flashlight lamps. Illustrated and priced. A priced folder showing "Gecoray" silvered glass reflectors for shop-window lighting, and "Unalux" dustproof lighting units for interior lighting.

The Benjamin Electric, Ltd., Brantwood Works, Tariff Road, Tottenham, N.17.—List No. 800. A well-produced catalogue of industrial, commercial, and general lighting products, also a pamphlet illustrating lamp reflectors.

Messrs. W. T. Henley's Telegraph Works Co., Ltd., Engineering Department, 11, Holborn Viaduct, E.C.1.—An illustrated and priced booklet describing "Isco" cut-outs.

Messrs. J. W. Brooke & Co., Ltd., Adrian Works, Lowestoft.—No. MM/25, a well-produced catalogue describing various types of Brooke marine motors. Illustrated and priced.

The Sun Electrical Co., Ltd., 118-120, Charing Cross Road, W.C.2.—List No. 430, containing illustrations, particulars and prices of electric fires of various makes. Also priced and illustrated pamphlets Nos. 423 and 427, dealing respectively with "Sunco" wires and cables and cartridge fusegear.

Messrs. John Lawton & Sons, Ltd., St. George's Works, Harford Street, Birmingham.—A comprehensive priced catalogue of electric lighting fittings and accessories.

Bankruptcy Proceedings.—Edward Moses Lewis, "Rosedene," St. Martin's Road, Caerphilly, late 23, Charles Street, Cardiff, electric storage battery agent.—The public examination of this debtor was held recently at Cardiff. The statement of affairs showed a deficiency of £447. Debtor admitted that his books had not been properly kept and that his capital was not sufficient to keep him out of debt. He could not account for an item of £500, and said he supposed goods had gone out which had not been entered in the books. The examination was adjourned.

A. L. Dyer, Marsh Street, Newcastle-under-Lyme, Staffs., electrical engineer.—The public examination of this debtor was held on October 14th at the Town Hall, Hanley. The statement of affairs showed gross liabilities of £187 and assets of £17, leaving a deficiency of £166. Debtor stated that he commenced business without capital in May, 1924, as an electrical engineer at Newcastle. In March of this year he took the tenancy of a workshop at Marsh Street, Newcastle, and had since carried on business there. His turnover during the last 12 months had been about £325, and had yielded a net profit of £125. He attributed his failure to not keeping his expenses within the limits of the net profits. He stated that he was now employed on electrical work by a firm in London. The examination was closed.

W. R. Squire, electrical engineer, 11, Steward Street, Springhill, Birmingham.—Receiving order made October 13th on debtor's own petition.

H. McClelland, wireless apparatus merchant, 12, Leigham Avenue, Streatham Hill, S.W., late of 48, Strand, W.C.—First meeting, October 30th at 29, Russell Square, W.C.1. Public examination, November 26th at the Court House, Wandsworth.

S. Scarfi (Scarfi Bros.), cycle, gramophone, and wireless agent, 78, Alexandra Road, Newport, Mon.—First and final dividend of 4d. in the £, payable October 26th at 4, Charterhouse Square, E.C.1.

T. A. Wickham, electrical engineer, Snaresbrook, Station Road, New Melton, Southampton.—First meeting, October 23rd, at the Official Receiver's office, Midland Bank Chambers, High Street, Southampton. Public examination, November 18th, at the Court House, Southampton.

S. L. Bapty and L. Miles (Wireless Instrument Manufacturing Co.), wireless instrument manufacturers, Avenue Works, Avenue Road, Willesden, N.W.—Supplemental dividend of 2d. in the £, payable at 4, Charterhouse Square, E.C.

Company Liquidations.—The Hudson Irving Radio Co., Ltd., Pitt Street, Glasgow.—A meeting of creditors was held recently in Glasgow, when a statement of affairs was presented which showed liabilities of £1,349 and assets estimated to realise £482. No allowance was made for bad or doubtful debts in the statement of affairs. Up to 1924 the business was carried on in partnership, and in July of that year the limited liability company was formed with a nominal capital of £1,000. A branch business was carried on at Greenock. Originally that branch was profitable, but after the company was formed losses were sustained, and it was closed down at the end of last year. In the first year the company had a turnover of £2,802, with a loss of £482. In addition, there was a loss of £400 on the Greenock business. There had been a further loss on the trading at Glasgow during the present year. A wholesale business had been conducted and the margin of profit, which equalled 10 per cent., had been insufficient. The creditors confirmed the voluntary liquidation with the liquidator already appointed, and an informal committee.

H. W. Smith & Co., Ltd., electrical wire and cable manufacturers, Lydbrook, Gloucestershire.—The statutory first meeting of creditors and shareholders was held on Monday in London. In the absence of a quorum the meetings were formally adjourned for a week, and the chairman intimated that the liquidation would then doubtless be left in the hands of the Official Receiver. Our report of the proceedings is unavoidably held over.

Middleton Electric Traction Co., Ltd.—Winding up voluntarily. Liquidators, Messrs. T. Bower and T. H. Underhill, 88, Kingsway, W.C.2. Meeting of creditors at 88, Kingsway, W.C., November 2nd.

Associated Electric Traders, Ltd.—First and final dividend of 10½d. in the £, payable at Carey Street, W.C.

Alklum Electrics, Ltd.—Liquidator, Mr. T. W. Meldrum, 9, New Square, W.C., appointed September 23rd.

Standard Electric Sign Co., Ltd.—Liquidator, Mr. H. E. Burgess, Senior Official Receiver, Carey Street, W.C., released October 14th.

British Portable Radio, Ltd.—A petition for the winding up of the above-named company has been presented to the High Court by the Marconiphone Co., Ltd., of Marconi House, Strand, W.C., creditors, and was to be heard in London on October 20th.

3B Wireless Telephone Co., Ltd.—Winding up voluntarily. Liquidator, Mr. G. Gradon, 43, Gower Street, W.C. A meeting of creditors was called for October 21st, at the offices of the Liquidator.

Clemmons Aluminium, Ltd.—A first and final dividend of 1s. 8d. in the £ is being paid. Liquidator, Mr. C. T. Appleby, 26, Corporation Street, Birmingham.

Dissolutions of Partnership.—Parry & Blood, electrical and mechanical engineers, the Crown Hotel Garage, Pwllheli.—Mr. R. Parry and Mr. R. Blood have dissolved partnership. Mr. Parry will attend to debts and continue the business.

Lisle Radio Co., wireless set and accessory dealers, 37, Lisle Street, Leicester Square, W.C.2.—Mr. H. G. B. Wither and Mr. P. Parry have dissolved partnership. Debts will be attended to by Mr. Wither, who will continue the business.

Deed of Assignment.—H. W. Sutton (C. A. Sutton and Co.), wholesale electrical supplies merchant, 110, Dale Street, Liverpool.—Particulars of claims to the trustee, Mr. R. A. Latimer, 81, Dale Street, Liverpool, by October 23rd.

Calendar.—We have received from the E.G.S. Co., Ltd., a wall calendar for 1926, with monthly slips and an excellent view of Warwick Castle.

American Loans to Germany.—An Exchange dispatch to the *Financial Times* states that as a result of the warning of the Reichsbank President, Dr. Schacht, it has been decided to restrict the issue of local German municipal loans as much as possible. The negotiations for a big municipal loan in America will not be concluded before all requests for loans from German towns have been re-examined. Only the most urgent loans will be sanctioned.

Unemployment.—There was a fall of 38,828 in the number of registered unemployed during the week ended October 12th, the total at that date being 1,258,800. The total at the equivalent period of last year was 1,210,201.

For Sale.—Mr. H. J. Shaw, in conjunction with Messrs. Seymour & Seymour, will sell by auction on November 5th, at 550, Oxford Street, W., a quantity of wireless goods and material, including headphones, cable, transformers, &c. The Superintending Engineer, N.W. District, Air Ministry, Uxbridge Depôt, invites offers for surplus generating sets, boilers, pumps, &c., now lying at the R.A.F. station, Aldergrove, Belfast. Sutton Coldfield Corporation Electricity Department invite offers for one d.c. feeder booster, with switchboard. (See our advertisement pages to-day.)

Copper, Lead, and Rubber Prices.—Messrs. F. Smith and Co. report, October 20th: No change in the prices of copper (electrolytic) bars, sheets, wire rods, and h.c. wire.

Messrs. James & Shakespeare report, October 20th: Copper bars (best selected), sheet and rod, £92 per ton, £1 inc. English pig lead, £40, 10s. inc.

Messrs. Edward Till & Co. report, October 20th: India-rubber, Para fine, 3s. 5d., 3½d. inc.

Local Exhibitions.—Under the auspices of the Yorkshire Electric Power Co., an exhibition of domestic electrical appliances was held from October 15th to 24th inclusive at the premises of Messrs. Hopwood & Deacon, electrical contractors, Keighley Road, Skipton. The exhibition was opened by the Chairman of the Electricity Committee of the Skipton Urban District Council.

An exhibition of domestic electrical appliances, held under the auspices of the Electricity Committee of the Stockton-on-Tees Corporation, was opened by the Mayoress on October 19th.

Book Notices.—"More Things That Matter" is the title of a recent volume by Lord Riddell (Hodder & Stoughton, Ltd., price 7s. 6d. net), containing some 40 articles which originally appeared in *John o' London's Weekly*—essays which range from the philosophy of ancient Greeks to the art of the modern commercial traveller, touching upon Winston Churchill, the drink problem, Fords, and the law of property *en route*. Needless to say, we find few references to electrical subjects in this book; but it is full of what, after all, is vastly more important—the knowledge of man and his ways—which is communicated to the reader in a flowing, chatty style which never flags, so that when one reaches the close of one of these short "things" one regrets that there was not more of it. It is interesting to note that in proving that Britain is not a back number the author relies largely upon the many inventions connected with electricity, and shows a remarkably wide acquaintance—for a layman—with the history of electrical developments. As a book for casual reading it can be thoroughly recommended.

"Electrical Estimating for Industrial Lighting Installations," by J. C. Connan. Pp. 214; illustrated. London: E. and F. N. Spon, Ltd. Price 12s. 6d. net.

Chinese Electrical Notes.—The Yuan Ming Electric Light and Power Co. has recently been organised in Wanan, Anhwei province. The company proposes to mill rice, besides supplying the district with electric light. The Kung Ho Electric Co. at Pingwang, Kiangsu province, has recently been sold to the Kung Hsin Electric Co. The Peking Telephone Administration has submitted a report to the Ministry of Communications to the effect that the Administration has made preparation for opening a North Office in Peking, and that a site at Kwen Chieh has been purchased for the erection of offices. The Ministry has instructed the authorities to proceed with building and installation preparations at once. The Ministry of Communications is in receipt of a wire reporting the installation of the Peking-Kalgan long-distance telephone line. Chen Liu has been appointed director, with instructions to make connections with the Peking Telephone Administration.—*Chinese Economic Bulletin.*

American Radio Apparatus.—We have received a copy of the *Radio Dealer* Year Book for the season 1925-1926, published by the *Radio Dealer*, of New York (264 pages, 5s. 6d.). It is a directory of the numerous producers of radio material in the United States. The contents are arranged in classified form, and in some cases prices are quoted—indeed, the publication claims to be a price list and catalogue of American radio apparatus. Mr. A. J. Smith, of Church View House, Solihul, Birmingham, is the representative handling the book in this country.

Lighting and Power Notes.

Abergavenny.—Electricity in Bulk.—At the October meeting of the Town Council it was reported that the Hereford Town Council had offered, in connection with the supply of electricity in bulk, to make the minimum payment for the first year £500 and in the second and third years £750 per annum, and to supply electricity at 1.7d. per kWh. It was also reported that the Electricity Commissioners had asked for a revised report from the Council's consulting engineer, seeing that the last one was made in January, 1924, and it was decided to obtain a revised report based on the offer of the Hereford Corporation, and forward it to the Commissioners.

Australia.—Sydney.—According to the *Industrial Australian and Mining Standard*, an area of land at Bunnerong Point, Botany Bay, has been selected as a site for the Sydney City Council's power house. A tunnel about 1,500 ft. long will be driven under Bunnerong Point so that the water from Yarra Bay may flow to the power house, ensuring a continuous supply of cold water for the turbines. Mr. S. Y. Maling, deputy general manager, who will have control of the building operations during the absence of Mr. Mackay in London, states that it is proposed to construct the new power house in three sections, each of 100,000 kW. The present power house at Pyrmont has a capacity of 50,000 kW. When the three sections are in operation the Pyrmont power house is to be used mainly as a relief supply for the generation of electricity needed to meet the peak load demands during the busy hours of the afternoon. The cost of erecting and equipping the first unit at Bunnerong Point is estimated to cost approximately £2,000,000, and when completed the power house will have cost nearly £5,000,000. It is hoped that the first portion of the new power house will be in operation by the end of 1928.

Barnoldswick.—Objection to Order.—The Urban District Council has lodged formal objection to a proposal of the Electrical Distribution of Yorkshire, Ltd., to apply for an Order empowering it to distribute electricity in the district, as the Council itself is proposing to apply for an Order to distribute electricity in its area. The Council has decided to invite representatives of the Earby Urban District Council to attend a conference to discuss the question of electricity supply in both areas.

Bedwas and Machen.—Electricity Scheme.—The Urban District Council has adopted an electricity scheme for the Bedwas and Trethomas Wards, submitted by the electrical engineer, Mr. S. Thomas. A bulk supply of electricity will be obtained from the South Wales Power Co. and a sub-station erected at a total cost of £5,459.

Bradford.—Year's Working.—The report of the city electrical engineer, Mr. T. Roles, on the working of the Corporation electricity undertaking for the year ended March 31st last shows a total income of £483,385, as compared with £250,595 in 1923-24. Working expenses amounted to £259,468, as against £250,595, leaving a gross profit of £223,917 (£258,936), to which was added a Government grant for works for unemployed of £910, making a total of £224,827. Capital charges, &c., absorbed £186,103, and there was a net surplus of £38,723, as compared with £97,609 in the preceding year. A contribution of £23,600 was made to the district rate. The capital expenditure during the year amounted to £219,429, the chief items being £79,554 for plant, &c., at Valley Road station, and £115,070 for mains and services. The sales of electrical energy increased from 67,359,496 to 69,347,691 kWh, and the average price per kWh obtained fell from 1.72d. to 1.592d. The installation of e.h.p. armour-clad switchgear for the 16,000-kW turbo-alternator which has recently been added to the plant was completed during the year, and a 1,350-kW motor-converter was installed at Sunbridge Road sub-station. Orders were placed for additional converting plant at Thornbury, Odsal, and Four Lane Ends sub-stations.

Extension of Supply.—The Corporation has applied for an Order authorising it to extend its area of supply to Clayton. Cables run at present to the Bradford-Clayton boundary, and it is estimated that the township and district can be supplied within six months from the time of sanction. The estimated cost of the scheme is £11,000.

Loans.—The Corporation Finance Committee has rescinded an authority given on April 4th, 1924, to apply for sanction to borrow £1,474 in connection with the erection of a new transformer chamber at Harrogate Road, Apperley Bridge, and in lieu thereof has authorised application to borrow £2,517 for larger works now proposed. Sanction has been received to the borrowing of £10,310 for the replacement of e.h.p. feeder mains between Undercliffe and Apperley Bridge.

Cannock.—Extension of Supply.—The Urban District Council has approved a scheme for the supply of electricity to the villages of Cheslyn Hay and Great Wyrley. The estimated cost of the scheme is £26,000.

Cardiff.—Year's Working.—We have received from Mr. C. G. Morley New, city electrical engineer, a copy of his report, together with the statement of accounts, on the working of the electricity undertaking for the year ended March 31st last. The revenue amounted to £224,702, and working expenses were £109,070, leaving a gross profit of £115,632. The figures for the preceding year were: Income, £217,226; working expenses, £89,224; gross profit, £128,001. To the gross

profit was added income from other sources, making a total of £127,597. Capital charges absorbed £75,697, leaving a net surplus of £51,899. This was carried to appropriation account, together with a balance of £90,282 from the previous year, making a total of £142,181, and was distributed as follows:—Works of a capital nature, £14,524; rate relief, £14,153; balance carried forward, £113,503. The result of the previous year's working was a surplus of £50,483. The capital expenditure during the year amounted to £78,100, and included £16,850 for machinery and £43,364 for mains and services. The sales of electrical energy increased from 23,854,136 to 25,671,031 kWh, and the average price obtained per kWh fell from 2.18d. to 2.10d. The maximum supply demanded rose from 12,062 to 12,940 kW.

Carlisle.—Extension of Supply.—The Corporation Electricity Committee has recommended that application be made for an Order to extend the cables outside the existing area of supply at Scotby at an estimated cost of £2,297, and that the consent of the Rural District Council to the extension be sought.

Colchester.—Railway Station Supply.—The London and North Eastern Railway proposes to take a supply of electricity from the Corporation for its station at Colchester, and the sheds, yard and laundry. Its requirements will be from 35,000 to 40,000 kWh per annum for lighting, and 60,000 kWh for power.

Dartford.—Objections to Order.—Objections to the Special Order applied for by the Urban District Council to include the parish of Stone in its area of supply have been lodged by the Kent Power Co., the West Kent Power Co., the Dartford Rural District Council, and the Port of London Authority.

East Lothian.—Electricity Supply.—The Lothian Electric Power Co. is extending its area of supply so as to include Aberlady and Gullane.

Edinburgh.—Shop-window Lighting.—We are informed that the Corporation has decided to hire out Venner time switches for late shop-window lighting.

Guatemala.—Electrical Development.—Authority has been issued by the Administration for an extensive survey of the State, to be completed within six months, with the view to constructing an electrical distribution system for a wide area. The first scheme contemplated will include the use of the Government-owned power plant at Santa María, and a supply will be extended to Patzun. The second scheme will serve a district between Santa María and Retalhuleu.—*Reuter's Trade Service* (Guatemala City).

Lancashire.—Electrical Development.—According to the *Manchester Guardian*, the Electricity Commissioners have approved the scheme for bulk supplies of electricity for Blackpool and Lytham-St. Annes, to be obtained from Preston power station, and the line of route is now being surveyed for overhead cables. Blackpool will take from 5,000 to 10,000 kilowatts. Preston will commence to supply Leyland, through the Lancashire Electric Power Co. on November 1st, and the work in connection with the linking-up of Blackburn with Preston is nearing completion. Preston Corporation is expected to proceed shortly with extensions to its power station.

Lincoln.—Loans Sanctioned.—The Town Council has received sanction to loans of £17,000 for mains, and £2,415 for a transformer and sub-station equipment.

Maybole (Ayrshire).—Electricity Scheme.—The National Electric Construction Co., Ltd., has written to the Town Council offering to give a supply of electricity to the town. A representative of the company is being asked to meet the Council and discuss the proposed scheme.

Moreton.—Electricity Supply.—It was reported at a recent meeting of the local Council that Wallasey Corporation was prepared to provide electricity at 5d. per kWh for lighting, 2d. per kWh for power, and 1d. per kWh for heating.

Motherwell and Wishaw.—Electricity in Bulk.—The electrical engineer has submitted a report to the Town Council on the question of obtaining a bulk supply of electricity from the Clyde Valley Electrical Power Co., and the Council has decided to cease generating its own supply and to enter into an agreement with the Clyde Valley Co. for a supply in bulk. The estimated capital expenditure involved in the change-over is as follows:—Rotary converting plant (4,500 kW), £24,908; reconstruction of Motherwell station, £1,200; purchase of plant for Wishaw sub-station, £4,000; cost of new switchboard, £2,500. Application is to be made for sanction to a loan to cover the cost of the scheme.

Northern Ireland.—Rathfriland (Co. Down).—The new electric lighting scheme, which has been carried out by the Banbridge Gas and Electricity Co., was inaugurated on October 13th. The plant consists of a twin-cylinder Crossley crude-oil engine of 68 h.p., with a 35-kW Newton dynamo. The system is 220 V d.c.

Plymouth.—Inquiry Decision.—In connection with the applications of the Corporation, Plympton St. Mary Rural District Council, and Messrs. Hurrell & Heath, for an Order to supply electricity in the rural district of Plympton St. Mary, which formed the subject of a recent inquiry, the Electricity Commissioners have granted the application of the Rural District Council in respect of the whole of the rural district.

Loans Sanctioned.—The Electricity Committee has received sanction to the borrowing of £1,000 for two transformer chambers at the North Prospect Housing Estate and £7,450 for additional converting plant.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Sheffield.—Prices of all energy charged at 2d. per kWh or under, reduced from 20 to 10 per cent., on the basic rate, and of all energy over 2d. per kWh from 10 to 5 per cent., on the basic rate.

Doncaster.—Uniform rate of 1d. per kWh throughout the year for heating and cooking. Domestic rates, ¾d. per kWh for the summer months, and 1d. per kWh for the winter months.

Rotherham.—Power: A reduction of 10 per cent.

Sheffield.—Electricity Extensions.—The Electric Supply Committee has approved extensions to mains for general distribution purposes at an estimated cost of £14,928, and extensions of feeder mains and the necessary works at an estimated outlay of £9,242.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them for the supply of electricity by Blackburn Corporation in the parishes of Witton and Livesley.

Application has been made by Bradford Corporation for an Order authorising it to extend its area of electricity supply so as to include the urban district of Clayton.

Sunderland.—Street Lighting.—Taking advantage of the laying of a new tramway in Durham Road, the Corporation has decided to light the route by electricity from overhead mains, at an estimated initial expenditure of £1,288. The estimated cost of maintenance is £799 per annum.

Torquay.—Loans Sanctioned.—The Electricity Commissioners have given sanction to loans of £10,000 for transmission lines in connection with the bulk supply of electricity to Paignton, £6,143 for building extensions, and £41,300 for additional generating plant at Newton Abbot power station.

Electricity in Bulk.—At a recent meeting of the Electricity Committee, the Town Clerk pointed out that the question of the provision of a main transmission line to Totnes arose through the request of the Urban Electric Supply Co., Ltd., at Dartmouth, and the Electric Supply Corporation, Ltd., at Totnes, for a supply in bulk; but the Corporation could not afford such a supply until it was known whether the Electricity Commissioners proposed to grant the Central South Devon Electricity Order for the supplying of electricity in the territory between the Torquay area and the area of the above-mentioned companies, as the result of a recent inquiry held at Newton Abbot into the matter. The engineer gave particulars of the following schemes:—(1) Provision and laying of an e.h.p. main from Newton Abbot power station for the purpose of giving a supply in bulk to the borough of Totnes at an estimated cost of £18,054; (2) The provision and laying of an e.h.p. main from Paignton to Totnes to complete ring main, Newton-Torquay-Paignton-Totnes-Newton, at an estimated cost of £13,513; (3) The provision and laying of one e.h.p. main from Paignton to Dartmouth to give bulk supplies to the latter town and to Brixham at an estimated cost of £12,500. The Committee has recommended the Council to adopt provisionally the three schemes suggested in the event of the Central South Devon Electricity Order not being granted.

Electricity Charges.—The Corporation has approved the following schedule of charges for electricity:—A flat rate for lighting of 10d. per kWh, and for power of 1d. per kWh, with a minimum payment of 12s. 6d. per quarter for the winter quarters and 8s. 4d. for the summer quarters. A combined rate for lighting, heating, cooking, and domestic supplies of 3s. 9d. for each 40-watt lamp or equivalent, plus 1d. per kWh for electricity consumed. Power supplies: A quarterly standing charge of 12s. per h.p., with a minimum payment of 3s. 4d. per quarter, the charge not to exceed 3d. per kWh. Specially low rates to consumers taking a supply at 11,000 V, 3 phase, 50 cycles. The standing charges are subject to a discount of 5 per cent. for prompt payment.

Tynemouth.—Wiring of Houses.—In connection with the scheme for deferred payment for wiring, the electrical engineer has recommended that the slot meter system be adopted for small houses, and for larger houses that payment be made quarterly. The Council has adopted the recommendation in respect of installations the cost of which does not exceed £12, and has decided to set aside a sum of £5,000 from the accumulated profits for this purpose.

Ulverston.—Progress of Electricity Scheme.—Good progress is being made with the laying of mains from Barrow Corporation's power station and it is anticipated that an electricity supply will be available early in November.

Walsall.—Loan.—The Town Council is applying for sanction to a loan of £30,000 for extension of mains, this being the estimated expenditure during the ensuing three years.

Electricity Supply in Fulham.

Extensions at the Generating Station.

As recorded in our last issue, important extensions have been carried out at the Townmead Road power station of the Metropolitan Borough of Fulham, trebling the capacity of the plant. Early in March, 1924, the contract for the whole of the work was placed in the hands of Messrs. Vickers, Ltd., at £123,815, with the stipulation that additional energy should be provided in time for the following winter's load. The shortness of the period available for construction necessitated the execution of the contract under high pressure, and the borough consulting and electrical engineer, Mr. Arthur J. Fuller, M.I.E.E., collaborated with the contractors in planning the work so as to ensure the utmost expedition. The feat, which is understood to constitute a record in this country, was duly accomplished, including, besides the manufacture and erection of the plant, the building of the turbine room and the erection of a 50-ton travelling crane.

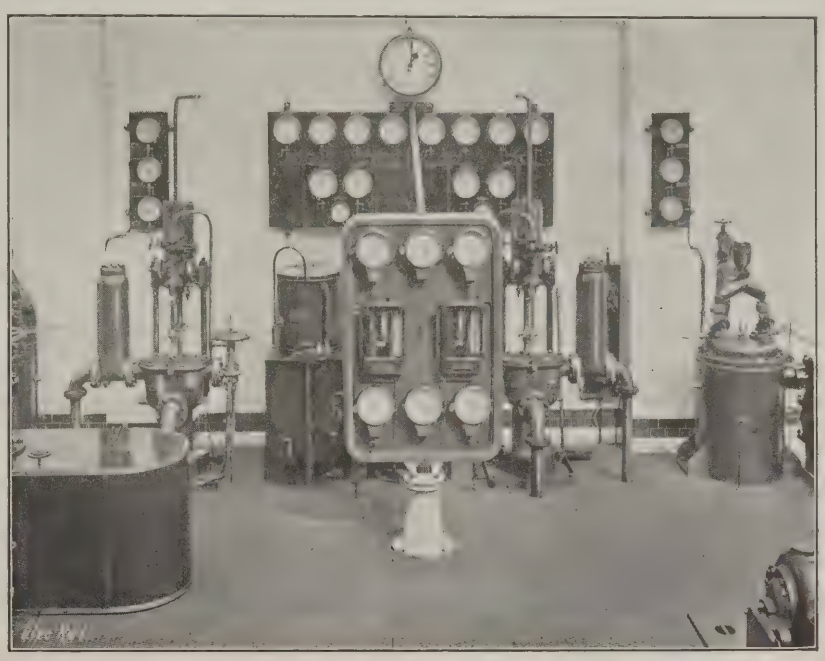

Fig. 1.—Controls on Turbine Platform.

The two new turbo-generators are of the Rateau impulse type, with multi-exhaust blading, and generate three-phase current at 6,600 volts, 50 cycles, when running at 3,000 r.p.m.; they are rated at 6,000 kW each, with a power factor of 0.8, and can carry an overload of 25 per cent. for two hours. They are designed for a steam pressure of 250 lb. per sq. in., superheated to 700 deg. F., and a vacuum of 28.8 inches of mercury; the full-load thermal efficiency is 25.2 per cent., and the steam consumption 10.22 lb. per kWh. The turbines are equipped with heaters, integral with the low-pressure casing, for bleeding steam from a stage shortly before the final stage for heating the feed water. The condensate, after passing through the surface heaters of the ejectors, is led through the turbine integral heaters, in which its temperature is raised to about 150 deg. F., thus effecting an economy of nearly 5 per cent. The rotating element is of the Metropolitan-Vickers standard design having a velocity wheel, 10 Rateau stages, and two multi-exhaust stages.

Fig. 2.—The New Turbo-generators.

E

All the diaphragm blades are of stainless steel, as are also those of the rotor in the region of the dew point.

Lubricating oil is tapped from the pressure side of the turbine oil system and passed through a diaphragm to the Fox filters. Thence it passes to a tank which allows it to settle for one hour, and returns by gravity to the turbine oil tank. The filtering starts automatically with the turbine, and no extra running plant is required. The whole of the turbine oil is in this way filtered once every six hours.

The condensing plant was designed, manufactured and erected by the Barrow-in-Furness branch of Messrs. Vickers, Ltd., and is of the "Contraflo" type (fig. 6). The cooling surface in each condenser is 8,500 sq. ft., and at full load each condenser requires 8,800 gallons of circulating water per minute. The shells of the condensers are of mild steel plate — a speciality of the Vickers Barrow works.

The air pumps are of the "Contraflo" two-stage steam ejector "Compact" type, with the ejectors in series, the discharged steam and vapour being condensed by contact with brass tubes through which the whole of the main condensate flows in two passes, thus heating the feed water, while the non-condensable gases are released to the atmosphere. Stability of operation throughout the whole range from atmospheric pressure to the highest possible vacuum is secured by means of a specially designed stabiliser fitted to the second ejector. The steam nozzles of the ejectors are of rustless steel.

Fig. 3.—Switchgear Gallery, from Turbine Platform.

The condensate is withdrawn from the main condensers by centrifugal pumps driven by electric motors, the whole being of Metropolitan-Vickers manufacture.

Circulating water is derived from the river by way of a sump below the existing pump house, and is carried in steel pipes 36 in. in diameter to the condensers and back to the river. The pumping plant was supplemented by a 21-in. Mather & Platt pump, of the vertical-spindle type to suit the space available in the pump house, as well as a smaller centrifugal pump on an upper floor; both pumps are driven by Metropolitan-Vickers two-phase slip-ring motors. The pipe line was erected for Messrs. Vickers, Ltd., by Messrs. John Spencer, Ltd., Wednesbury; an existing pipe line had to be demolished, without interfering with the running of the generating plant.

The alternators have bar-wound stators with mica insulation, and solid forged rotors; the cooling air is circulated through the alternators and coolers on the Metropolitan-Vickers patent closed-circuit system by fans mounted directly on the rotor shafts. The exciters are of the M.-V. standard design with radial commutators.

The output of the alternators is converted from 6,600-volt three-phase to 3,000-volt two-phase for connection in parallel with the existing supply by Metropolitan-Vickers Scott-connected transformers, three pairs of single-phase shell-type transformers rated at 2,000 kVA per pair being installed. They are oil-immersed and self-cooled, being mounted in boiler-iron tanks with external tubes. Adjusting tappings of + or − $2\frac{1}{2}$ and 5 per cent. are provided on the low-pressure side, to enable the voltage to be regulated on the Fulham system whilst the alternators are run at a

Fig. 4.—Boiler-house, Firing Floor.

Fig. 5.—Passage between Boilers; Chimney Base.

boosted pressure to supply Hammersmith and Battersea. The 6,600-volt switchgear, fig. 3, consists of five duplicate bus-bar Metropolitan-Vickers compound-filled armour-clad units, type K3, arranged for remote electrical operation. These control the two alternators and three Scott-connected transformer groups. The indicating instruments and control switches for the various circuits are mounted on black enamelled slate panels forming a vertical-type control board.

For controlling the low-pressure side of the three Scott-connected groups a 3-panel M.-V. truck-type 2-phase board has been supplied.

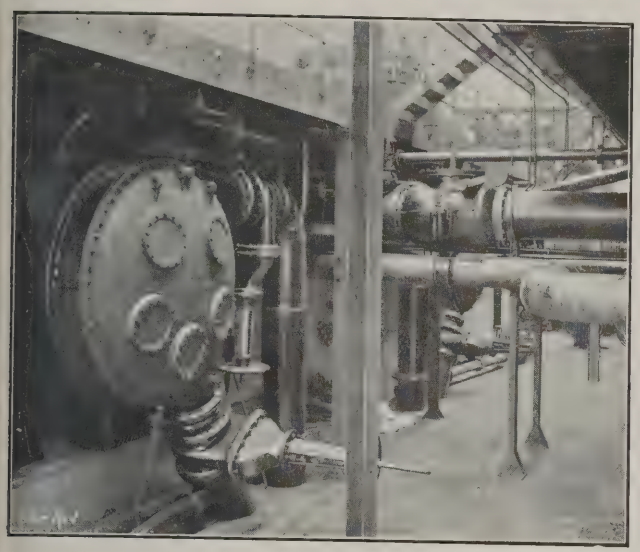

Fig. 6—Condenser and Piping in Basement.

The whole of the new 6,600-volt cables, together with the cables for the auxiliaries in the engine-room and boiler-house, were manufactured by Messrs. W. T. Glover & Co., Ltd., and installed by the Metropolitan-Vickers Electrical Co., Ltd.

The alternators are fitted with the Merz-Price circulating-current system of protection. A special arrangement is made by which the protective relay trips not only the main oil circuit-breaker but also an automatic circuit-breaker in the alternator main field, so that in the event of an internal fault, the possibility of damage is reduced to a minimum. The pillar containing this circuit-breaker is situated adjacent to the alternator.

The boiler plant, fig. 4, consists of three Vickers 5-drum, bent-tube type boilers, each having a heating surface of over 10,000 sq. ft., and giving a normal evaporation of 40,000 lb. per hour, at a working pressure of 275 lb. per sq. in., and a total temperature of 700 deg. F. at the turbine stop valve with feed water at 200 deg. F. Each unit includes a superheater, economiser, forced-draught fan and "Prat" induced-draught fan and chimney. The boilers are equipped with Diamond soot blowers. The stokers are of the Erith-Roe type, and consist of 11 retorts. The three economisers are of the Green ringstay type, each consisting of 256 tubes.

The feed pump equipment includes three Weir "Roto" feed pumps, each capable of delivering 6,000 gallons of water per hour.

The boiler equipment includes the whole of the steam, feed and blow-down pipes, the steam and feed water being recorded by "Ken" measuring apparatus, and for the temperature and CO_2 recording, a complete outfit of Cambridge instruments is installed. All the motors and control gear for the boiler-room auxiliaries were supplied by the Metropolitan-Vickers Electrical Co., Ltd.

The existing Gibbons ash conveying plant has been extended to provide ashing arrangements for the new boiler plant, and an ash elevator of new design replaces the original ash breaker. Concrete coal bunkers of 184 tons capacity have been erected in the new boiler house, and to facilitate the coal-handling arrangements, new bunkers of slightly smaller capacity have also been provided in No. 2 boiler house, the whole of these bunkers being fed by a Mitchell belt coal conveying plant.

In the turbine room a 50-ton Arrol overhead travelling crane, with Metropolitan-Vickers motors and control gear, has been installed.

For the foregoing particulars and the photographs here reproduced we are indebted to Messrs. Vickers, Ltd.

The Egyptian Government Workshops.

Recent Developments of the Ministry of Public Works.

Considerable improvements have recently been made by the Egyptian Government to the workshops of the Ministry of Public Works, which are situated on the east bank of the Nile at Bulak, Cairo, and are responsible for the maintenance and repairs to the Government inspection steamers and motor boats.

A new floating dock is in the course of construction, and is designed to take a load of 350 tons dead weight, making it suitable for docking the largest Government steamer on the Nile; the pumping plant is electrically operated by 20-b.h.p. motors.

The workshops are well equipped with log-saw and wood-working machines, and a foundry with an output of about 25 tons of iron and non-ferrous castings per week. A machine shop is provided with the most modern machines, including, in the steel construction section, electrically driven pneumatic power hammers, punching and shearing machines, plate and angle rollers, &c. Other sections are provided with electric welding plant and equipment for electroplating, &c. A siding from the Egyptian State Railways facilitates the transport of goods, and a 50-ton wharf crane is positioned so as to lift from either trucks on the siding or barges on the river, while an overhead runway connects the

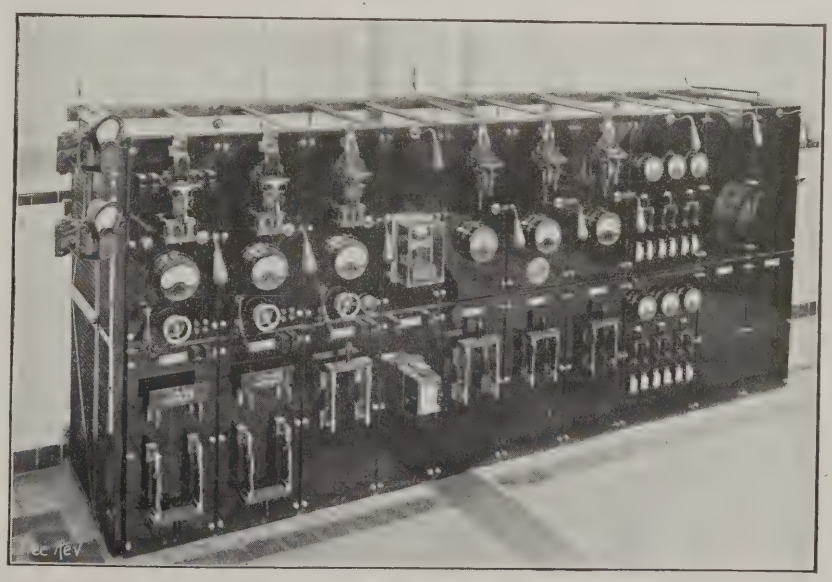

Fig. 1.—Main Switchboard.

main siding with the central stores and sections of the workshops.

The electricity supply is obtained from three 150-h.p., 4-cycle Diesel engines, each coupled to a 100-kW, 110-V, d.c. generator. The engines, fig. 2, which run at 250 r.p.m. and are capable of dealing with a 10 per cent. continuous overload, were suppied by Messrs. Sulzer Bros. They are of the vertical type, and each is fitted with a 3-stage vertical compressor directly driven from the main crankshaft. Each engine is provided with its own cooling-water pump, the suction and discharge pipes for which are interconnected, the water being lifted from a common artesian well and discharged into a large cooling-water tank on a steel platform outside the engine room. On the same platform are located the main fuel oil storage tanks, these being duplicated so that cleaning operations may be carried out without interfering with the normal running of the plant.

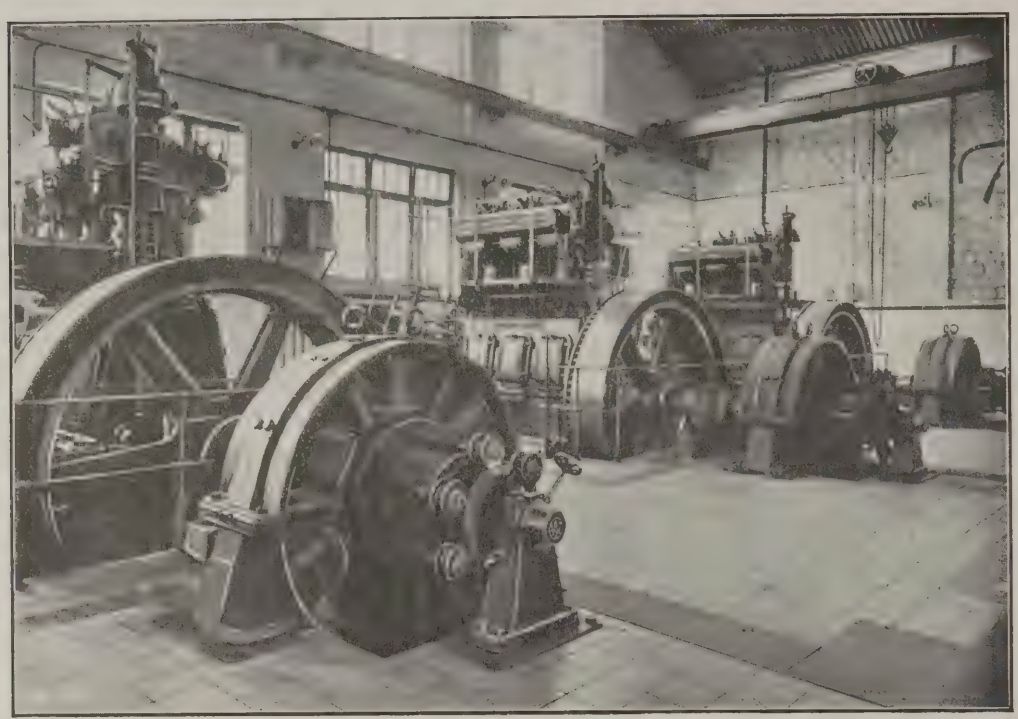

Fig. 2.—Generating Plant.

The electrical generators, supplied by the British Thomson-Houston Co., Ltd., Rugby, are of the multi-polar shunt-wound type, capable of sustaining an overload of 25 per cent. for two hours. The other electrical equipment, motors and control pillars, main switchboard, distribution panels, cables, &c., were also supplied by the B.T.-H. Co.

The switchboard, fig. 1, comprises three 100-kW generator panels, three power-feeder panels, one meter panel equipped with Everett-Edgcumbe instruments, one lighting-circuit panel, and two blank panels for future extensions. Synchronising apparatus is mounted on swing brackets on the first generator panel. The feeders from the main switchboard distribute the whole of the energy to three 6-way distribution fuseboards, suitably positioned to serve the 20-b.h.p. and smaller motors. These fuseboards are of the "Fluvent" enclosed ventilated type of Messrs. Parmiter, Hope & Sugden, Ltd., with d.p. porcelain bridge fuses, so arranged that when the fuse carriers are withdrawn no live metal is exposed.

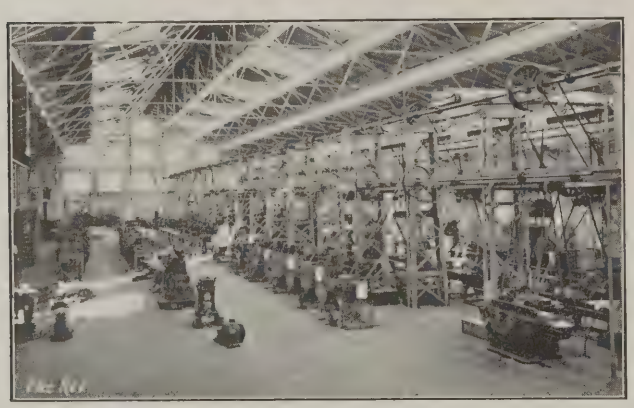

Fig. 3.—Fitting Shop.

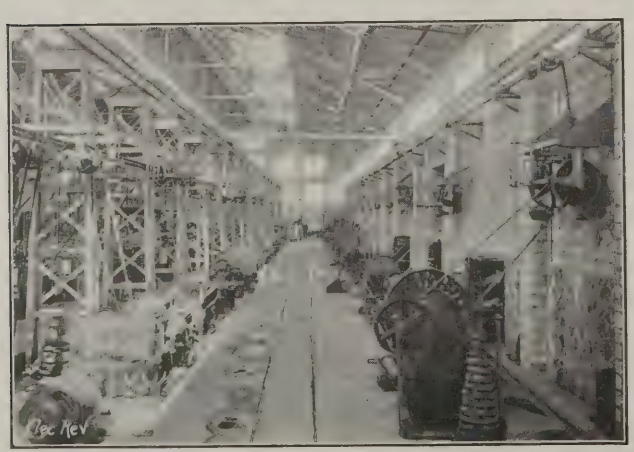

Fig. 4.—Heavy Machine Shop.

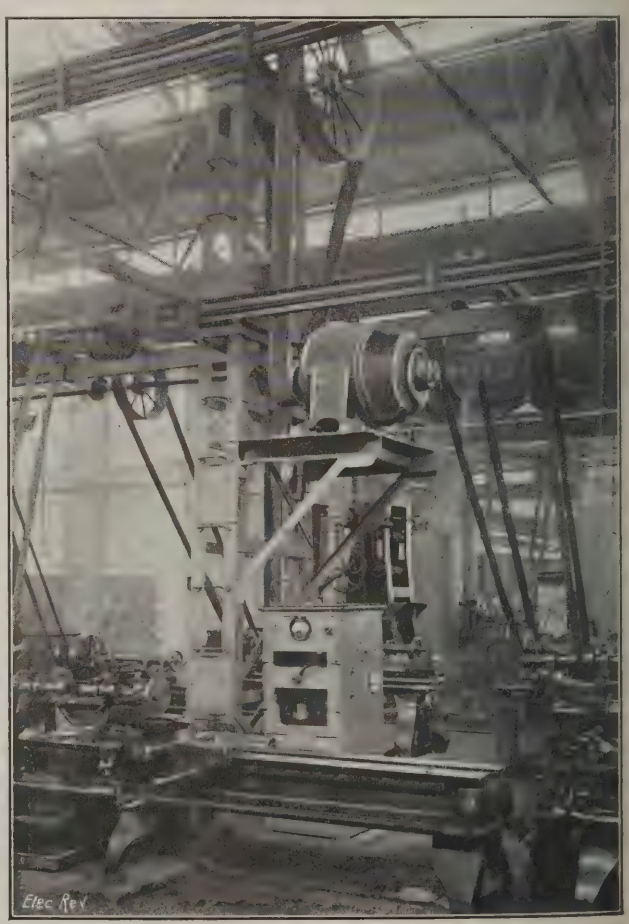

Fig. 5.—One of the Drive Groups.

The drives for the metal- and wood-working machine shops are arranged on the group system, main shafts running the whole length of the building, provided with "Skefko" ball bearings, being so arranged as to drive eight equal groups of machines of about 20 h.p. Each group is belt driven by a B.T.-H. 20-h.p. shunt-wound motor, 800 r.p.m. The control pillars for the motors are of the ventilated drip-proof design, equipped with d.p. contactor-type breakers and isolating switches and starting rheostats, &c. Fig. 5 shows one of the group drives; motor, shafting, &c.

A general view of the heavy machine shop, which is covered by a 3-ton "Herbert Morris" travelling crane, is shown in fig. 4. A feature of this department is the securing arrangement of the countershafts. Steel channels are carried the whole length of the workshops on latticed supports, thus enabling the countershaft bearing frames to be hung in any position by hook bolts without drilling. This was found to be particularly useful in the reconstruction, as the dismantling of the old shafting and re-arrangement of the new progressed simultaneously. Fig. 3 is a view of the fitting or light machine shop.

In planning the power supply, a reasonable reserve was allowed for future developments. It is anticipated that with the new status of the country, coupled with the higher training and experience gained by the Egyptian engineers and artisans, local production will rapidly increase.

It is interesting to note that the reconstruction of the building, including the steel structural work, and the rebuilding of the roofs, was carried out by the staff and workmen of the workshops, to whom credit is due.

Tramway and Railway Notes.

Colchester.—Railless Cars.—The Town Council has under consideration a proposal to introduce railless cars or motor-omnibuses in the town, and has appointed a special committee to obtain full particulars of the proposed schemes.

Continental.—Germany.—In anticipation of the proposed electrification of the German railways, especially in the Rhine district, it is planned to construct three power stations on the Rhine at Schwoerstadt, Dogern, and Reckingen. The erection of the first two works is to commence immediately. The cost of the complete erection is estimated at 56,000,000 Swiss francs.

Switzerland.—Work will shortly commence on the construction of a new electric tramway between Oerlikon and Affoltern, near Zurich.

Derby.—Year's Working.—The report on the working of the Corporation tramway undertaking (manager, Mr. F. Harding) for the year ended March 31st last shows a total revenue of £131,336, as compared with £121,757 in the preceding year. Working expenses increased from £87,473 to £91,625, leaving a gross surplus of £39,711. After providing for capital charges, &c., a net surplus of £27,767 remained, a record for the undertaking. The previous year's working resulted in a surplus of £21,749. The number of passengers carried increased from 17,710,109 to 19,292,279.

Doncaster.—Railless Cars.—The Corporation has decided to abandon the tramway track in the Bentley-with-Arksey urban district and substitute railless-car services. Provisional terms have been arranged between the Corporation, the Urban District Council, and the West Riding County Council with regard to the cost of road construction to carry these services. The change will cost the Corporation about £44,000, including contribution to the road reconstruction. Twelve new railless cars will cost £24,000, and alterations to overhead and electrical equipment about £5,000. An extension of the existing route is contemplated.

Liverpool.—New Routes.—The Corporation has received powers for the construction of the following new tramways:—Mill Lane and Lake Road, Mill Street, Beloe Street, Dingle Mount and Dingle Lane, Marybone, Gardner's Row, Bevington Bush and Bevington Hill, Great Crosshall Street, Brownlow Hill and Ullet Road and Walton Hall Avenue to Stopgate Lane.

Manchester.—Railway Electrification.—Local authorities are supporting representations to the railway company and the Ministry of Transport with regard to the electrification of the Manchester South Junction and Altrincham Railway.

Ramsbottom.—Year's Working.—The working of the Urban District Council's railless-car system for the year ended March 31st last resulted in a loss of £4,912, reconditioning of cars being responsible for £3,000. The motor-'bus service showed a profit of £728.

Sheffield.—Tramway Extension.—The Minister of Transport has issued an Order authorising the Corporation to extend the Handsworth tramway to Carr Lane, Woodhouse.

Telegraph and Telephone Notes.

Rugby Radio Station.—Telephone Plant Complete.—It is understood that the radio-telephone apparatus which the Western Electric Co. has installed at the wireless station at Rugby has been completed; so far as the company is concerned, everything is now ready for transmission, and the Post Office has taken charge. According to the *Morning Post*, transmission tests to America are likely to take place shortly.

Spain.—Radio Fog Signal.—On November 1st, a wireless fog signal installed at Cape Silleiro, on the Galician cost, will come into operation. The letters O R will be broadcast on a musical note of 800 vibrations per second during 30 seconds every five minutes. The wave-length used will be 1,000 metres, and an ordinary ship's wireless receiver will be able to pick it up at 30 miles distance. *The Times* points out that this is the first signal of its kind upon the Spanish coast.

Telegraph Conference.—Increased Charges.—Subject to the approval of a plenary meeting of the Conference, the Tariffs Committee of the International Telegraph Conference has agreed that the increased terminal and transit charges for telegrams shall come into force on April 1st, 1926. A Drafting Committee has been appointed to put the Tariffs Committee's recommendations into final shape. The date of their submission to a plenary meeting of the Conference has not yet been fixed. The increases, which it is considered certain will be formally adopted despite British opposition, merely constitute the maximum rates chargeable and are not obligatory.—*Reuter* (Paris).

Tariffs.—The Conference has been sitting since the beginning of September, and another important recommendation was that henceforth the charge per word to the public for telegrams by wire and wireless shall always be identical in all inter-European traffic, thus preventing any future under-cutting of rates by wireless. The reason why this is only to apply to traffic between European countries is that the International Telegraph Convention has never fixed maxima for tariffs for extra-European telegrams. Thus, the increase in terminal and transit charges will only be applicable to European countries, but it may affect traffic between Europe and the rest of the world in so far as the terminal charges at the European end can be increased. It is understood that Great Britain, which has fought against all increases throughout the Conference, is determined that increases which are not compulsory shall not be applied to any appreciable extent, if at all, to telegrams between Great Britain and abroad.—*Reuter* (Paris).

Telephones for the Deaf.—An Amplifier.—A special receiver for those whose defective hearing precludes the use of the ordinary telephone is in use in the United States. The principal element is a thermionic valve, by means of which the deaf person can amplify the current in stages and so increase the sound reproduced by the diaphragm. The set has little or no special value for those whose hearing is normal.

The Telephone Service.—Development.—The Federation of British Industries has suggested to the Postmaster-General that extension and improvement schemes might, in view of the present state of unemployment, possibly be hurried. Expenditure is now about £1,000,000 per month, and the Postmaster-General has £36,000,000 for this purpose.

Underground Cables.—According to the *Evening News*, during the last six months 30 underground cables have been completed and brought into use. They extend, altogether, for more than 470 miles, and contain 70,400 miles of wire. In addition, the new main cable between London and Glasgow, 440 miles, has been laid. During the last financial year more than 1,000 miles of main cables was drawn into underground conduits. There are now in this country 4,000,000 miles of post office wire underground, and 1,000,000 miles overhead.

United States.—Selective Radio Transmission.—A demonstration of the simultaneous transmission of eight or more wireless messages from one transmitting valve on the same ten-metre wave-length, and their reception on a single instrument, was made three weeks ago by the inventor, Mr. J. H. Hammond, jun., before officials of the Navy Department, who have now permitted the announcement of a detailed account of this system of "selective secret radio transmission." Prime importance is attached to the utilisation of short wave-lengths in view of the fact that virtually all the available wave-lengths have already been allotted to broadcasting stations, says *The Times*, which explains that the general principle of the system is the projection of a short carrier wave at the rate of, say, 30,000,000 vibrations per second, on to which are impressed one or more modulatory waves at the rate of 27,000 vibrations per second and upwards, which produce periodic changes of intensity in the carrier wave. The Hammond receiver is designed to separate the frequencies of the complex incoming wave, having one circuit sensitive to the carrier wave and the other circuits sensitive to the frequencies of the modulatory waves. Only an operator knowing the frequencies which are being used can pick out incoming messages.

Radio Notes.

Continental Relays.—Another Experiment.—The first relay of Continental wireless programmes took place on October 15th, and was broadcast from the B.B.C. London station. The attempt, though not a complete success, served to show what could be done in re-broadcasting Continental stations. It was the first time that the Hayes receiving station of the B.B.C. had officially figured in the musical programmes, and it is understood that another attempt will be made on October 29th.

Sounds Competition.—Interesting Experiment.—The radio sounds competition which was broadcast from all the B.B.C. stations, except Belfast, on October 16th is welcomed as a technical experiment of considerable interest, for it is astonishing how difficult it may be to recognise the commonest of sounds by the ear alone without the aid of sight. The competition was organised by *Popular Wireless*; 20 familiar sounds were made in the London (2LO) studio for listeners to identify, prizes being offered for the most correct lists.

Wave-Lengths.—Recent Alterations.—The Geneva Wireless Bureau recently altered the wave-lengths of 25 Continental broadcasting stations in an endeavour to abate interference between stations. Last week the wave-lengths of six British stations were increased; for instance, 2LO has been raised from 357.7 metres to 364, but the official figure still continues to be published as 365.

Russia.—Radio Apparatus Production.—As a result of the ever-increasing demand in the Soviet Union for radio apparatus for amateurs, production at the works of the Elektrosviaz Trust is continually being extended. During September alone amateurs' radio apparatus to the value of half a million roubles was turned out.—*Reuter's Trade Service* (Moscow).

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Aldershot. — November 3rd. Electricity Department. 1,500 yd. paper-insulated lead-covered armoured l.p. cable. (See this issue.)

Australia.—Sydney.—November 30th. Public Works Department. Metering equipment for the Barren Jack hydro-electric development scheme and the Kiama-Nowra transmission line.*

December 16th. New South Wales Government Railways and Tramways. 10 single-phase, 1,800-kVA transformers.*

Melbourne.—December 14th. Electricity Commission of Victoria. 22,000-V insulators. (October 16th.)

Belfast. — November 2nd. Electricity Department. Motor-generator and transformer. (October 9th.)

Bo'ness.—Town Council. Electric lighting work in connection with the housing scheme. Director of Housing, Burgh Chambers, Bo'ness.

Dublin.—November 12th. Great Northern Railway (Ireland). Stores for six months (including electrical fittings, lamps, cable and wire, &c.). (See this issue.)

Egypt.—Cairo.—December 1st. Ministry of Public Works. Two pumping units and accessories for the Mex pumping station.*

Erith.—November 6th. Electricity Department. 100 house-service prepayment meters. (See this issue.)

London.—H.M. Office of Works.—November 3rd. Installation of cables, switchboards, &c., and wiring at the Ministry of Pensions Hospital, Orpington. (October 16th.)

November 4th. Electric wiring in conduit at Montagu House. (October 16th.)

Metropolitan Asylums Board. November 4th. Installation of two new hydro extractors at the Western Fever Hospital, Seagrave Road, S.W.; installation of hot-water heating apparatus at St. Anne's Home, Herne Bay; and installation of automatic telephones at the Downs Hospital for Children, Sutton, Surrey. (October 16th.)

Paddington.—November 3rd. Great Western Railway. Telegraph instruments, electrical apparatus, &c., telegraph ironwork and tools, telegraph drysalterers. November 20th. Electrical wires and cables. (October 16th.

London County Council. November 2nd. Wiring and fittings for electric lighting at the New Road elementary school, Clapham, S.W. (181 wiring points controlled by 168 switches). (See this issue.)

Manchester. — November 6th. Electricity Committee. One 500-kW fully automatic, motor or rotary converter, transformers and switchgear, &c. Three 500-kW fully automatic, motor or rotary converters or mercury-vapour rectifiers, transformers, switchgear, &c. (October 16th.)

New Zealand.—Hastings.—February 1st. Borough Council. Diesel engine and a.c. generator.*

Smethwick.—October 24th. Education Committee. Electric light installation at New Holly Lodge High School. Mr. A. H. Sears, Secretary for Education, Education Offices, 215, High Street, Smethwick.

Southampton.—November 2nd. Harbour Board. Alterations to the electrical equipment of 12 cranes, supply of cables, disconnecting boxes, switchgear. Specifications from Mr. W. G. Gubbins, clerk, Harbour Offices.

Uruguay.—Montevideo.—November 27th. State Electricity Supply Works. H. and l.p. cables and accessories.*

January 7th, 1926. 26,000 kilograms of copper wires and cables.*

January 5th. Bare copper wire, quicksilver.*

January 8th. Black and G.I. wire, &c.*

January 11th. 96,000 metres lead-covered wires and cables.*

January 12th. 44,500 metallic and carbon-filament lamps.*

Administration Nacional del Puerto de Montevideo. January 2nd. Machine tools and equipment.*

West Ham.—November 16th. Education Committee. Installation of electric lighting and central heating at the Cumberland Road new secondary school. (See this issue.)

York.—November 12th. Electricity Department. One 6,000-kW, 3-phase turbo-alternator, with condensing plant, pipework, &c.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Barnstaple.—Board of Guardians. Accepted:—
Installing electricity at the new casual wards.—Garnish & Lemon.

Bolton.—Tramways Committee. Accepted:—
Three top-covered single-truck tramcar bodies.—English Electric Co., Ltd.

Carlisle.—Electricity Committee. Accepted:—
Flange pipes (£165).—Aiton & Co., Ltd.
Circulating-water screens (£1,537).—F. W. Brackett & Co., Ltd.

Gravesend.—Electricity Committee. Recommended:—
Foundation steelwork for generator (£240).—Measures Bros. (1911), Ltd.

India.—Lightalloys, Ltd., has received the contract for the whole of the doors (sliding and hinged) required for the new electrified rolling stock being built by Messrs. Cammell, Laird & Co., Ltd., for the Bombay, Baroda and Central India Railway.

Irish Free State.—The following were among the contracts placed by the Controller of Stores, Department of Posts and Telegraphs, during September, 1925:—
Battery plates.—D. P. Battery Co., Ltd.
Electric light stores.—Falk, Stadelmann & Co., Ltd.
Switchboard jacks.—British L. M. Ericsson Mfg. Co., Ltd.
Switchboard frames.—T. R. Scott & Co., Ltd.
Telegraph accessories.—International Electric Co., Ltd.; Western Electric Co., Ltd.
Telephone cabinets.—Siemens Bros. & Co., Ltd.
Telephone lamps.—Phœnix Telephone & Electric Works, Ltd.

Leeds.—Tramways Committee. Accepted:—
25 sets of Ackley brakes (£381).—British Ackley Brake Co., Ltd.
Portable electric welding plant (£225).—Premier Electric Welding Co., Ltd.

Electricity Committee. Accepted:—
Cable.—Enfield Cable Works, Ltd. (£1,086); W. T. Henley's Telegraph Works Co., Ltd.(£1,400); Macintosh Cable Co., Ltd. (£768).
Poles and cables for overhead distribution at Thorpe sewage works (£824).—Wilson Hartnells Installations, Ltd.

Lepton.—Urban Council. Accepted:—
Installing electric light in 50 houses, six lights in each (£4 per house).—Yorkshire Electric Power Co.

London.—St. Pancras.—Electricity and Public Lighting Committee. Recommended:—
Two 1,000-kW motor-converters working at 750 revolutions per minute (£8,212).—British Thomson-Houston Co., Ltd.
One 1,000-kW motor-converter working at 500 revolutions per minute (£4,731).—General Electric Co., Ltd.

London County Council.—Stores and Contracts Committee. Accepted:—
Electric fittings for 12 months.—Baxter & Caunter, Ltd.; British Central Electrical Co., Ltd.; British Electrical and Mfg. Co.; G. S. Peckham & Co., Ltd.; Juliux Sax & Co.; Tok Switches, Ltd.
Electrical insulating materials for 12 months.—L. Andrew & Co.; Attwater and Sons; British Insulated & Helsby Cables, Ltd.; British Central Electrical Co., Ltd.; J. Cookson, Ltd.; Hamnett & Andrew; L. P. S. Electrical Co., Ltd.; Pomona Rubber Co.; A. A. Sample; Siemens Bros. & Co., Ltd.; J. L. Scott & Co.

Hammersmith.—Electricity Committee. Recommended:—
32-300-amp. double-pole l.p. fuse units (£140).—W. Lucy & Co., Ltd.
Eight circuit-breakers (£80).—J. G. Statter & Co.
12 months' supply of coal for the electricity department: Digby ⅜ in. slack (approx. 19,000 tons), 15s. 7d. per ton for barge deliveries, 14s. 10d. per ton for rail deliveries; Gedling washed singles (approx. 10,300 tons), 22s. 4d. per ton (barge), 21s. 7d. per ton (rail).—Judd, Budd, Ltd.
Glen Rhodda Welsh thro' coal (2,700 tons), 30s. 9d. per ton (rail).—W. McElroy & Co.

Islington.—Lighting Committee. Recommended:—
Two inter-connector switches (£1,880) and two feeder switches (£1,370); rotor for alternator (£3,000).—Metropolitan-Vickers Electrical Co., Ltd.

Metropolitan Asylums Board.—Works Committee. Installation of fire alarm system, Tooting Bec Hospital:—

Cox-Walkers (Recommended.)	£277
Read & Partners, Ltd.	424
W. H. Agar	445
Smethurst & Co. (London), Ltd.	450
A. Hawkins & Sons	639

Installation of X-ray apparatus, Northern Hospital:—

Newton & Wright, Ltd. (Recommended.)	£286
A. E. Dean & Co.	325
Schall & Son, Ltd.	325
X-Rays, Ltd.	358
Watson & Sons (Electro-Medical), Ltd.	367
Medical Supply Association, Ltd.	373

Installation of electric bells, Lambeth Casual Ward :—

T. Clarke & Co., Ltd. (Recommended.)	**£150**
W. H. Agar	152
Toy & Winslow	163
Buchanan & Curwen	173
G. E. Taylor & Co.	181
Lund Bros. & Co.	194

ADMIRALTY.—Park Royal Engineering Co., Ltd., has received a contract from Messrs. Cammell, Laird & Co., Ltd., for a main switchboard for H.M.S. *Rodney*.

Portsmouth.—Tramways Committee. Recommended:—

Brake blocks.—Day, Wallis & Co.

Overhead line materials.—Brecknell, Munro & Rogers, Ltd.; A. and J. M. Anderson Mfg. Co.; Day, Wallis & Co.; R. Wood & Son; G. W. Allsop; Engineering & Lighting Equipment Co., Ltd.; R. Johnson & Nephew, Ltd.

Electric sign at tramway offices (£285).—General Electric Co., Ltd.

Sheffield.—Electricity Committee. Accepted:—

Additional transformers (£2,652).—British Electric Transformer Co., Ltd.

Shipley.—District Council.

Electric lighting at smallpox hospital (£179).—G. Binns.

Forthcoming Events.

Institution of Electrical Engineers.—INFORMAL MEETING.—Monday, October 26th.—At the Institution, Victoria Embankment, W.C. Discussion on "How Can the Cost of Distribution be Cheapened?" to be opened by the president, Mr. R. A. Chattock.

(North-Eastern Centre).—Monday, October 26th. At Armstrong College, Newcastle-on-Tyne. At 7 p.m. Address by the chairman, Mr. R. W. Gregory.

Nottingham Society of Engineers.—Monday, October 26th. At the Victoria Station Hotel, Nottingham. At 7.30 p.m. Lecture on "The Evolution of Hand Tools," by Mr. A. S. Barnes.

Institution of Civil Engineers.—Thursday, October 29th. At the Institution, Great George Street, S.W. At 6 p.m. Joint meeting with the bodies which are co-operating in the work of the Special Committee on Tabulating the Results of Heat-engine Trials. Discussion on "Standard Codes for Tabulating the Results of Trials of Gas-engines and Gas Producers," to be opened by Mr. G. J. Wells.

Junior Institution of Engineers.—Friday, October 30th. At 39, Victoria Street, S.W. At 7.30 p.m. Kinematograph lecture, showing the construction and assembly of the 50,000-kW turbo-alternator plant for Chicago at the works of Messrs. C. A. Parsons & Co., Ltd.

Electrical Trades Commercial Travellers' Association.—Friday, October 30th. At Elma Rooms, 15, Savoy Street, W.C.2. At 7 p.m. Lecture on "Salesmanship," by Mr. V. Dale.

Notes.

Edinburgh Electrical Society.—The syllabus for the new session includes papers on automatic telephony, stationary batteries, radio telephony, maintenance, the influence of light in industry, cables, hydroelectric plant, organisation, the electrical equipment of a battleship, and country distribution—altogether a varied and interesting programme. On Wednesday last Prof. T. Hudson Beare was to deliver an address to the Society.

Victorian Electricity Commission Inquiry.—According to the *Melbourne Age*, the Government of Victoria has decided to appoint an independent engineer to investigate and report upon the working of the State Electricity Commission. It has taken this action in response to severe criticisms which have been made of the Commission's expenditure, particularly in connection with the Yallourn scheme, the cost of energy from which is stated to be much greater than that of electricity supplied by the State Railway power station.

Proposed Walmsley Memorial.—An appeal has been issued for donations toward a memorial fund of £2,000 which is being raised to perpetuate the memory of the close association of the late Dr. R. Mullineux Walmsley with the Northampton Polytechnic Institute. A committee has been formed representative of every phase of activity in the Institute. It is proposed to erect a tablet or other record of the late Principal in a suitable position in the Institute, and to endow a Walmsley Memorial Scholarship tenable in the Engineering Day College and available for all students of the Northampton Polytechnic Institute. We believe that there are a large number of our readers who owe much to the assistance received from Prof. Walmsley and his staff and we hope that the response will be ready and generous. Donations should be sent to Mr. W. K. Davis, the Hon. Treasurer, at the Institute, St. John's Street, E.C.1. Mr. J. Cameron Rennie is chairman of the committee and Mr. F. L. Best is acting as honorary secretary.

London Electrical Engineers.—27th A.A. Battalion R.E. (T.A.).—Honorary Colonel, Colonel R. E. B. Crompton, C.B.; Officer Commanding, Lieut.-Col. C. H. S. Evans, O.B.E.—The following orders have been issued for October and November :—

The Battalion will train during the ensuing year, 1925-26, as two Companies :—

305th Company (Major A. W. M. Mawby, O.B.E., A.M.I.E.E.).—Tuesdays, 7 p.m. to 9.30 p.m., commencing Tuesday, November 3rd, 1925.

306th Company (Major F. C. Clarke, A.M.I.E.E.).—Mondays, 7 p.m. to 9.30 p.m., commencing Monday, November 2nd, 1925.

Headquarters at 46, Regency Street, London, S.W.1, will be open until 8 p.m. on weekdays and 1 p.m. Saturdays.

Electricity in the Home.—At the autumn quarterly conference of the Leeds Labour Party Women's Central Committee, held last week, Miss Clara Adams, the secretary, read a paper on "Electricity in the Home," which had been prepared by Alderman D. B. Foster, who was unable to attend. The speaker said the old argument as to the cheeriness and comfort of the coal fire fell to the ground because the working woman had not time for sitting by the fire. Her time was largely taken up in doing unnecessary work which could be done more efficiently by means of electrical appliances. Reference was made to electricity as a means of eliminating the smoke nuisance and improving public health.

A Wheatstone Memorial.—On Monday last a memorial tablet to Sir Charles Wheatstone was unveiled at St. Michael's Church, Gloucester, by Sir Charles Sherrington, President of the Royal Society, the day being the 50th anniversary of Wheatstone's death.

Fatalities.—On October 15th, Alex. Robertson, employed as a coal cutter, lost his life as the result of an electric shock received while at work in the Bardykes Colliery, Cambuslang.

An inquest was held at Simonstone, last week, on James M'Kenna, electrical fitter, Radcliffe, who was killed at a substation belonging to the Lancashire Electric Power Company at Simonstone. Charles William Dyke, electrical fitter, said that he heard a crash and saw M'Kenna knocked backwards against the wall. Witness tried artificial respiration, but without success. Another witness said deceased must have touched a live wire. M'Kenna's head, he added, was within a few inches of the live conductor. The district engineer, Mr. T. Morphy, said he was not asked to isolate the sub-station, and he did not consider it necessary. The Coroner said that M'Kenna had not taken sufficient precaution, and he had paid the penalty. The jury returned a verdict of "Accidental death."

A New Railway Engine.—Representatives of the Canadian National Railways entered into a contract some time ago with Messrs. William Beardmore and Co., of Glasgow, for the development of an engine on the lines of that firm's new aero motor, but intended for the propulsion of short-distance rail cars. The Beardmore aero engine, while retaining the light weight and other essential characteristics of the usual engine of the kind, operates on the Diesel principle and burns crude oil of the cheapest varieties, the oil being injected into the cylinders at such a high pressure that it is automatically ignited without the use of sparking plugs or electrical apparatus. The smaller of the engines is a 4-cylinder one of 160 b.h.p., which has developed 250 b.h.p. on test. It weighs approximately 2,576 lb. The larger engine has 8 cylinders, is rated at 320 b.h.p., and has the same power-weight ratio. The engine is water-cooled, and employs forced lubrication at 60 lb. pressure per square inch, both oil and water being cooled in radiators usually situated on the roof of the car.

Two types of cars have been designed. The one in which the smaller engine is fitted has a body with an overall length of 60 ft. set on two four-wheel bogie trucks and includes an arrangement for the attachment of a trailer when desired. It carries 56 passengers, with space for luggage. The larger car is of the articulated type; it consists of two carriages, the outer ends of which are placed on four-wheel bogies, while the inner ends meet at the centre of a third four-wheel bogie. The total overall length of this car is 102 ft. It weighs 94 tons, and has a wheel base of 85 ft. 10 in. This car carries 126 passengers and luggage, and one half of it is a smoking compartment.

The electrical power is developed by a specially designed direct-current Westinghouse generator of 200 kW, 600 volts. The storage batteries are of the 272-ampere-hour, 300-volt iron-clad Exide type, carried beneath the car. There are four driving motors, each of 100 h.p., 600 volts, mounted two each on the front and rear trucks. The storage batteries are employed for lighting and other minor services throughout the car, and for starting the engine, which in turn charges them. It may be added that the engine can be run up to full speed immediately it starts to fire from dead cold.

The motorman's controls are similar to those of a street tramcar driver. The cars can be run either backwards or forwards, and are controlled from either end.

Trials of these cars took place recently in Canada, and the first two are now in service.

The larger car covered a distance of 117 miles in 2 hours 15 minutes' running time, an average of 52 m.p.h. The fuel consumption worked out at 3½ miles per imperial gallon.

Bristol Corporation Electricity Department. — CAPITAL STATION.—It is within the recollections of our readers that Bristol was concerned in the first inquiry held by the Electricity Commissioners, in connection with the setting-up of a Joint Electricity Authority for the Lower Severn Area. The proceedings came to a dead-lock, and the inquiry was adjourned *sine die*. In the meantime the Severn Barrage Scheme was under discussion and the Government appointed a Commission to report on the engineering merits of the scheme and the financial obligations consequent thereon. Whilst this investigation has been in progress, Bristol has been faced with an ever-increasing demand upon its generating resources. The Feeder Road power station, built in 1902, with five subsequent extensions, is found to be inadequate to meet the load of the immediate future. "Progress" has been the slogan of the Bristol Electricity Committee since its inception, and plans have already been approved for the construction of a generating station at Portishead Dock, at the mouth of the River Severn, with an ultimate capacity of 240,000 kW without overload. The proposal is to complete the station in five stages,

the initial instalment being 40,000 kW, and for a number of years this will run in parallel with the Feeder Road station. The main features of the first stage are the provision of two 20,000-kW, 11,000-volt, 50-period, turbo-generators, and five boilers, each rated at 80,000 lb. per hour at a pressure of 310 lb. per square inch and a temperature of 700 deg. F., complete with chain-grate stokers, mechanical-draught plant, economisers, &c. The generators will be connected solid to step-up transformers, and energy will be transmitted to sub-stations at a pressure of 33,000 volts between phases, all switching being carried out on the 33,000-volt side.

Subsequent stages will entail the installation of five sets, each of 40,000-kW capacity, and to meet the requirements for circulating water, Mr. H. Faraday Proctor, city electrical engineer, has decided to construct inlet and outlet culverts through solid rock for a distance of about 2,000 yards, each culvert being 12 feet inside diameter; the crown of the inlet tunnel will be at least 4 feet below the lowest recorded tide level.

The Electricity Commissioners have approved the details of this scheme, and it is expected that the station will be ready for commercial load in the autumn of 1927. The Corporation is prepared to consider tenders from contractors who are capable of carrying out the initial stage of the station in its entirety.

Appointment Vacant.—Electrical engineer for the Borough of Pudsey Electricity Department. (See our advertisement pages to-day.)

Electrical Trades Benevolent Institution.—Festival List.—The following is a preliminary list of donations to the Benevolent Fund recently received:—

	£	s.	d.
Babcock & Wilcox, Ltd.	10	10	0
Balfour, Beatty & Co., Ltd.	2	2	0
Barralet, E. S.	20	0	0
Bailey, G., Sons & Co., Ltd.	2	2	0
Berkeley, A. (Birmingham)	1	1	0
Budenberg Gauge Co., Ltd.	1	1	0
Bunting, John H.	1	1	0
Callender's Cable & Construction Co., Ltd.	25	0	0

Electricity Supply at Stoke-on-Trent.—Extensions at Hanley.—A large gathering assembled on Thursday last at the Central Power House, Hanley, for the opening ceremony of the big extension to the Stoke-on-Trent electricity works, just completed. Prior to the ceremony, Mr. A. Burton, city surveyor, gave a brief description of the buildings, and Mr. C. H. Yeaman, the electrical engineer, outlined the history of the undertaking. The Central Power House was opened in 1913, and since then there had been three extensions. He directed attention to an exhibition of electrical appliances, cookers, heaters, &c., which had been staged at the King's Hall. He said that if the plant could be kept running the full 24 hours they could supply energy at a halfpenny a unit, or even less. They were anxious to save coal, and this involved the utmost utilisation of the heat in the steam; the makers of the turbine—the Metropolitan-Vickers Company—were good enough to give the Corporation the better set of the two they submitted in their specifications, at the lower price. It was the first of its kind, and with it they hoped to achieve a world's record for output and low coal consumption for this size of set.

The door of the extension boiler house was unlocked by the Mayor (Alderman H. Leese), and the vice-chairman of the Committee (Councillor G. Hassall) started the fans and grates. In the engine room the Mayoress turned on the steam to No. 5 turbine, and simultaneously an electrical device at the end of the building—"City of Stoke, 1925"—flashed into life. Mrs. G. Hassall switched on the exciter of No. 5 alternator, and the Mayor subsequently closed the main switch.

After an inspection of the works, the party was conveyed to the King's Hall, where tea was provided. Alderman Sampson Walker, in proposing a vote of thanks to the Mayor and Mayoress for their hospitality, said that much of the success of the undertaking was due to Mr. Yeaman, the electrical engineer, who was held in very high esteem throughout the whole electrical world. Alderman Leese had held the chairmanship of the Electricity Committee from September, 1910, to the present time, and he was the right man in the right place.

The Mayor, replying, said the district was elongated, and it contained no big factories, so that the cost of distribution was high. The average price was about 1.58d. per unit. So far as generating costs were concerned, Stoke stood second on the list of 33 large towns in the Midlands.

A vote of thanks to the contractors was proposed by Mr. J. M. Travers, J.P., a member of the Electricity Committee.

Capt. R. S. Hilton (Metropolitan-Vickers Electrical Co., Ltd.), replying, said that some of the most highly developed countries in the world were those where the use of electricity per head of the population was greater than in other countries. It was a matter for regret that we in this country were still a long way from the top. When he was in Russia about six weeks ago he discovered to his astonishment that they were developing their sources of electricity supply in a most wonderful manner. Thirteen large power stations were being erected, and it seemed as if the scheme was to connect up from the Baltic to the Black Sea with a chain of electricity stations.

Mr. G. Summers (Stirling Boiler Co., Ltd.), and Mr. J. Meiklejohn (Messrs. Meiklejohn & Sons) also responded.

On behalf of the whole of the contractors, Capt. Hilton presented a silver tea and coffee service as a token of esteem and in recognition of 15 years' service rendered by the Mayor as chairman of the Electricity Supply Committee. Capt. Hilton also presented a smoker's outfit to Mr. G. Hassall, and a silver rose bowl to Mrs. Hassall.

Institution Notes.

Institution of Electrical Engineers. — North-Midland Centre.—The opening meeting and smoking concert are to be held at the Hotel Metropole, Leeds, on November 10th, at 7 p.m., when Mr. S. Derwen Jones will read his inaugural address as chairman.

Informal Meeting.—The first informal meeting of the session will be held on Monday next, when the president, Mr. R. A. Chattock, will open a discussion on cheapening the cost of distribution.

Institute of Physics.—The ninth lecture of the series, "Physics in Industry," will be delivered by Dr. B. A. Keen, assistant director of the Rothamsted Experimental Station, and will deal with "The Physicist in Agriculture, with Special Reference to Soil Problems." The lecture, which will be open to the public, will be given in the rooms of the Chemical Society, Burlington House, London, on Wednesday, November 25th, at 5.30 p.m., and the chair will be taken by Sir William Bragg, president of the Institute.

Junior Institution of Engineers.—Super-pressure Cable Dielectrics.—On Friday last Mr. A. J. Tracey, A.M.I.E.E., delivered a lecturette on this subject, and exhibited a large number of diagrams giving particulars of tests on high-voltage cables. He explained that the thickness of the dielectric was a most important figure to be mentioned in the results of tests, as the dielectric strength varied enormously with the thickness. Figures and diagrams were shown illustrating the effect of foreign matter and air pockets in dielectrics. Mr. Tracey said that an occluded air pocket was one of the worst things that could be found in a dielectric. It was worse than a piece of metal. It had frequently been discovered that impregnated paper-insulated cables which had been subjected to very high dielectric stresses for long periods exhibited charred spots which appeared to be incipient breakdowns and usually took a tree-like form. Mr. Tracey exhibited several reproductions of such tree forms.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

South Shields Corporation Electricity Committee recommends increasing the salary of Mr. James Edgar, the electrical engineer, from £700 to £800 a year.

Mr. A. Chew, of the Aldershot Corporation electrical works staff, who is leaving to become chief clerk in the electricity department at Welwyn Garden City, Herts., has been presented by his colleagues with a silver hunter watch.

Mr. G. W. Mayle, for some years with the Igranic Electric Co., Glasgow, is now with Messrs. J. J. Inglis & Co., engineers, of Glasgow.

A Sydney newspaper reports that radio men were present in large numbers at a luncheon of the Electrical Association, when occasion was taken to say farewell to Mr. O. F. Mingay, manager of the Burgin Electric Co. Mr. Mingay was about to leave for England for a couple of years to study radio conditions abroad.

Mr. H. C. Bradbrook, director of Waygood-Otis (Aust.) Proprietary, Ltd., before leaving for England was tendered a farewell dinner by the staff at the Hotel Sydney, and was presented with an Australian souvenir.

Mr. Charles A. Hopkins, chief assistant to the late Mr. W. M. Milnes, tramways manager, Wigan, has been appointed his successor. The position is a provisional one for twelve months, at a salary of £600 per annum. Mr. Hopkins went to Wigan in 1919. Previously he was with the Chatham and District Light Railways Co. and the Swindon Tramways and Electricity Department. There were 40 applications for the post.

Mr. F. G. H. Macrae has just returned from a five years' tour of India and is now assistant manager and advisory engi-

neer at the Stoll Picture Theatre (London Opera House), Kingsway, W.C.2.

The marriage took place on October 14th, at Preston, Faversham, of Mr. Thomas Pye, partner in the firm of H. S. Tett & Co., Ltd., electrical engineers, of Faversham and Sittingbourne, and Miss Winifred Mary Chambers, of Faversham.

Alderman P. W. Petter, J.P., of Messrs. Petters, Ltd., Yeovil, is Mayor-Elect of the borough.

Mr. A. H. Darker, A.M.I.M.E., A.M.I.E.E., chief electrical engineer of Messrs. J. Stone & Co., Ltd., London, is leaving England on October 23rd by the P. & O. steamer *Narkunda* on a business tour through Ceylon, India, Burma, Australia, New Zealand, and America.

We are informed that Mr. W. C. Davey, Senr., of Messrs. W. C. Davey & Co., telephone and electrical engineers, of 28 and 29, Mortimer Market, Tottenham Court Road, W.C.1, has retired after more than 50 years' activity in the electrical industry.

Mr. W. A. Benger has relinquished his position as chief designer to Messrs. F. & A. Parkinson, of Guiseley, Leeds, in order to commence business on his own account as a chartered electrical engineer at 102, Albion Street, Leeds.

Shoreditch Borough Council Lighting Committee recommends that Mr. C. Newton Russell be appointed consulting engineer at a fee of 300 guineas for one year, as from the date of his proposed retirement from the position of borough electrical engineer.

Mr. Francis Joseph Moffett, B.A., M.I.E.E., is the chairman of the South-Midland Centre of the Institution of Electrical Engineers. He delivered his address on Wednesday evening. Mr. Moffett was educated at the Yorkshire College of Science, Leeds, and at the University College of North Wales. On completion of his course at the latter college, he took his degree in arts at the London University. His theoretical electrical training was obtained at the School of Electrical Engineering, Hanover Square, London, W. After serving an apprenticeship in an engineering works, he served for some time as an engineer on the staff of the National Telephone Co. and subsequently joined the Woolwich District Electricity Supply Co. In 1897 he was appointed chief electrical engineer to the Colony of S. Nigeria and superintended the erection of the electric power station in Lagos. On retirement from the Colonial service, he entered the firm of Messrs. Preece & Cardew, consulting engineers, Westminster, and was occupied on various electric light and power work, including the electrical equipment of some of H.M. dockyards. In 1908 he commenced to practise in Birmingham as a consulting engineer, in partnership with Mr. N. B. Rosher, and since that time has been responsible for the design and supervision of various electrical schemes, as well as for the inspection and testing of plant for the Dominions, Crown

Mr. F. J. Moffett.
Chairman of the South-Midland Centre of the Institution of Electrical Engineers.

Colonies, and foreign countries. In 1921, on the retirement of Mr. N. B. Rosher from the firm, he was joined by Mr. F. H. Mann, A.M.I.E.E. Several years ago he translated the work on "Alternating Currents," by MM. Loppé and Bouquet, and has recently written a book on "The Electric Furnace." Mr. Moffett is a member of the Association of Consulting Engineers.

Mr. J. S. Thomson, who delivered his address as chairman of the Dundee Sub-Centre of the Institution of Electrical Engineers last night, is manager of the Fife Electric Power Co., Dunfermline. He was educated at Montrose Academy and at the City of London School. He gained his early electrical experience in the Deptford station and Mains Department of the London Electric Supply Corporation. After

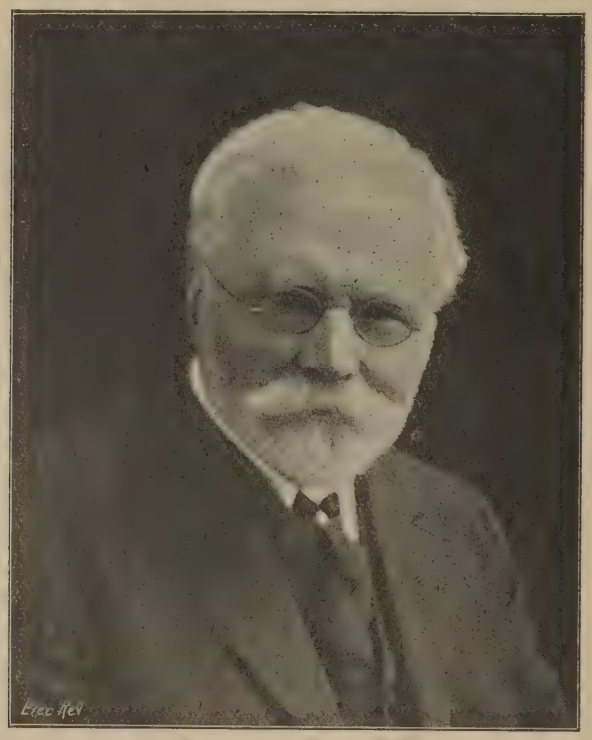
Mr. J. S. Thomson.
Chairman of the Dundee Sub-Centre of the Institution of Electrical Engineers.

holding various posts with the Wimbledon Urban District Council, the Corporation of Newport (Mon.) and the South Wales Electrical Power Distribution Co., he was appointed in 1905 to the position which he still holds with the Fife Electric Power Co. In Fife a supply is at present being given in over 30 towns and villages and to some 50 farms, in addition to power supplies to collieries and other works over an area of 25 miles from the power station. Some idea of the class of work may perhaps be gathered from the fact that on a system comprising some 125 miles of e.h.p. overhead lines and underground cables there are no fewer than 125 transforming points.

Mr. L. A. Coe, of Siemens & English Electric Lamp Co., Ltd., previously with Siemens Bros. Dynamo Works, Ltd., has been appointed manager of Messrs. Wm. Sanders & Co., switchgear manufacturers, Wednesbury, Staffs. He will take up his new duties on November 1st.

Obituary.—Mr. J. Angus.—We regret to record the death, which occurred several months ago at a Kenya nursing home, of Mr. James Angus, A.M.I.E.E. Mr. Angus, who was 48 years of age, was until a little before his death chief engineer and manager of the Nairobi Electric Lighting Co. He had occupied that position for 12 years, and was about to take a long trip home when he was taken ill.

Mr. A. T. Collier.—The death has taken place at his residence at St. Albans of Mr. Arthur Thomas Collier, the inventor of the Collier telephone receiver.



Mr. Sidney Morgan (25), an electrical engineer, of Kidderminster, employed by the Shropshire, Worcestershire and Staffordshire Electrical Power Company, died in the Bromsgrove Cottage Hospital on October 14th, as the result of injuries received while motor-cycling.

Ald. W. Bruce.—Striking tribute to the memory of the late Ald. Wm. Bruce, for many years chairman of the Sunderland Corporation Electricity Committee, has been paid by Sir John Snell, Chief Electrical Commissioner, in a letter to Sunderland Town Council, expressing his sympathy at the Council's loss. He wrote: "For 11 years he was Chairman of the Electricity Committee when I was the Electrical Engineer, and we lived a strenuous life in those days. Ald. Bruce was exemplary in his thoroughness, but it was a great education for me, and we worked in double harness for all those years with a growing respect for him on my side and, I believe, a faith in me on his. The borough owes much to him."

Mr. J. B. Duke.—The death occurred on October 12th of Mr. J. B. Duke, popularly known as the "Tobacco King" of the United States. Apart from his activities in the realm indicated, however, Mr. Duke was a leader in hydro-electric development in the North American Continent. He was the progenitor of the series of hydro-electric stations now grouped together under the control of the Southern Power Company and immediately prior to the war he financed the development of the Saguenay River, Quebec Province. This work was in-

terrupted by the war, but it was resumed two or three years ago and a plant with a capacity of 550,000 h.p. has been erected on the river, and a part of this is already in service. This development is considered to be one of the most important in Canada's industrial history and a number of important undertakings are being commenced in the district. One of the most prominent is that of the Aluminium Company of America, which has decided to erect a plant there.

Prof. Andrew Gray, F.R.S.—As was briefly mentioned in our last issue, Professor Andrew Gray, D.Sc., LL.D., F.R.S., Emeritus Professor of Natural Philosophy at the University of Glasgow, passed away on October 10th at the ripe age of 78 years. Dr. Gray was the eldest son of John Gray of Lochgelly, Fife. In 1875 he became secretary and assistant to Lord Kelvin (then William Thomson), who had already occupied the Chair of Natural Philosophy in the Glasgow University for thirty years. In 1876 he became Eglinton Fellow in Mathematics. He became Kelvin's official assistant in 1880 and four years later he took up the professorship of physics in the University College in North Wales, which he held until 1899, when he was recalled to Glasgow to succeed Lord Kelvin in the Chair of Natural Philosophy. He resigned the chair in 1923 and received the title Emeritus Professor. Prof. Gray was the author of numerous contributions to scientific literature, the first being his book on "Absolute Measurements in Electricity and Magnetism," which appeared in 1883. Other

The late Prof. Andrew Gray, F.R.S.

works on the same subject followed, and in this connection we may mention that when the Electrical Review celebrated its 25th birthday in 1897 one of the valued contributions to its Special Issue was a signed article by him on "Absolute Measurements." In that article he began by saying that the advances in practical electricity during the 25 years preceding 1897 had been "enormous" and that "it was not too much to say that that progress had been in no small degree due to the adoption of an absolute system of units for the measurement of electrical quantities." In 1888 Prof. Gray expanded his book under the title "Theory and Practice of Absolute Measurements in Electricity and Magnetism," Vol. I; the second volume was published in 1893, and a new edition in 1921. His bent was towards mathematical analysis, and he published an important work on "Magnetism and Electricity" in 1898, in the preface of which he recorded his deep appreciation of the value of Mr. Oliver Heaviside's work on electromagnetic theory—a far-sighted view which was fully justified many years later. Unfortunately, though Prof. Gray produced several works on dynamics and kindred subjects—including his classic "Treatise on Gyrostatics and Rotational Motion" in 1919—the second volume of "Magnetism and Electricity," we believe, was never published. In 1915, when he delivered the Kelvin lecture before the Institution of Electrical Engineers, he reviewed Lord Kelvin's contributions to the subject of gyrostatics, with demonstrations in which Kelvin's original apparatus, which he had helped to make, was employed. During the war Prof. Gray was a member of the Inventions Panel of the Ministry of Munitions, and in a notable address as president of the Mathematical and Physical Science Section of the British Association in 1919, he discussed some of the lessons taught by the war.

Wills.—The late Mr. E. B. Caird (of Caird & Rayner, engineers) left £41,552 gross and £41,224 net personalty.

The late Mr. Henry Bevis left £64,116 gross and £60,246 net personalty.

New Companies Registered.

J. S. A. Syndicate, Ltd. (208,894).—Private company. Registered October 8th. Capital, £100 in £1 shares. Objects: To carry on the business of electricians, mechanical engineers, manufacturers of machinery and trade implements of all kinds, toolmakers, brassfounders, metal workers, manufacturers of and dealers in wireless apparatus, appliances and inventions, &c. The subscribers (each with one share) are:—T. S. Jones, 31, Belsize Square, Hampstead, N.W.3, chartered accountant; J. N. Baker, Broad Street House, Old Broad Street, E.C., accountant. The first directors are to be appointed by the subscribers. Qualification, £1. Remuneration, £25 each per annum. Solicitors: W. T. Hick & Co., Broad Street House, Old Broad Street, E.C.2.

L. Vincent Thomas & Co., Ltd. (209,041).—Private company. Registered October 16th. Capital, £500 in £1 shares. Objects: To carry on the business of electrical, mechanical, and marine engineers and draughtsmen, &c. The subscribers (each with one share) are:—Mrs. Theresa Edith Thomas, 5, Richmond Terrace, Swansea; E. Ironside, Bishopston, Swansea, solicitor's managing clerk. Mrs. Theresa Edith Thomas is the first director and secretary (*pro tem.*). Solicitors: Gee & Edwards, Llanfair Buildings, St. Mary Street, Swansea. Registered office: 5, Richmond Terrace, Swansea.

Andy Gramophone Co., Ltd. (208,952).—Private company. Registered October 12th. Capital, £100 in £1 shares. Objects: To acquire lands, buildings and hereditaments in England for the erection and establishment of manufactories and workshops with suitable plant, engines and machinery with a view to manufacture, purchase, sell and deal in gramophones, phonographs, and all kinds of loud-speaking apparatus, and any other article adapted for sound reproduction, and amplifying apparatus and wireless or radio apparatus and accessories, either directly or indirectly through the medium of agents or otherwise, &c. The subscribers (each with one share) are:—W. O. Forder, 6, Grays Inn Square, W.C.1, solicitor's clerk; C. W. Hunter, 14, Gardenia Road, Enfield, accountant. The first directors are not named. Remuneration as fixed by the company. Solicitors: Braund and Hill, 6, Grays Inn Square, W.C.1. Registered office: 42, Upper George Street, Edgware Road, W.1.

Emerald Radio Co., Ltd. (208,933).—Private company. Registered October 10th. Capital, £1,000 in £1 shares. Objects: To adopt an agreement with G. W. Parr, and to carry on the business of electrical, mechanical and general engineers and contractors, manufacturers and sellers of transformers, radiators, dynamos, motors and radio instruments of all kinds, &c. The first directors are:—A. E. Pater, 1, Arcade House, Finchley Road, N.W.11, builder; G. W. Parr, Loampit Hill House, Lewisham, S.E.13, engineer (chairman); E. J. Walker, 4, Francemary Road, Brockley, S.E.4, engineer (all permanent). Solicitors: Rundle and Hobrow, 9, Ironmonger Lane, E.C.2. Registered office: 10, Bush Lane, Cannon Street, E.C.4.

Izzard Brothers, Ltd. (208,939).—Private company. Registered October 10th. Capital, £1,000 in £1 shares. Objects: To acquire the business carried on by "Izzard Brothers" at 13, Upper Clapton Road, E.5, and to carry on the business of manufacturers of and dealers in electrical and mechanical appliances and scientific instruments, and all parts, fittings and accessories for these, particularly with regard to wireless telegraphy or telephony. The life governing directors are:—A. T. Izzard, 118, Evering Road, Stoke Newington, N.16, radio engineer; R. E. Izzard, 198, Lower Clapton Road, Clapton, E.5, radio engineer. No qualification required. Secretary: J. R. Homer, 198, Lower Clapton Road, E.5.

Union Welding Co., Ltd. (208,982).—Private company. Registered October 13th. Capital, £5,000 in £1 shares. Objects: To carry on the business of electric, acetylene, blow-pipe and other forms of welding and soldering, ship builders and repairers, boat, barge and motor and other launch builders, shipowners, wharfingers, timber merchants, metallurgists, electrical engineers and contractors, &c. The first directors are:—G. W. Roger, "Iona," 44, Dartmouth Row, Blackheath, S.E., naval architect (life director); W. Ellis, 23, Billiter Street, E.C.3, shipbroker; J. Caldwell, The White House of Speen, Princes Risborough, Bucks. Qualification, 100 shares. Remuneration, £50 each per annum. Secretary: G. H. Marshall. Solicitors: Stibbard, Gibson & Co., 21, Leadenhall Street, E.C.3. Registered office: 23, Leadenhall Street, E.C.3.

Forbes Brothers, Ltd. (13,829).—Private company. Registered in Edinburgh October 12th. Capital, £2,000 in £1 shares. Objects: To carry on the business of manufacturers of wireless apparatus and plant of all kinds, &c. The first directors are:—F. R. Forbes, 692, Cathcart Road, Glasgow, engineer; J. Forbes, 347, Cumberland Street, Glasgow, draper. Qualification, 100 shares. Registered office: 50, Sauchiehall Street, Glasgow.

A. G. Inrig & Co., Ltd. (209,015).—Private company. Registered October 15th. Capital, £750 in £1 shares. Objects: To adopt an agreement with G. Inrig, trading as "A. G. Inrig & Co.," Nicholas Lane, Laindon, to carry on the business of constructional and electrical engineers, as formerly carried on by A. G. Inrig & Co. The first directors are:—G. Inrig (permanent), Nicholas Lane, Laindon; L. Inrig, 15, Manor Road, Teddington. Qualification, £1. Secretary: G. Inrig. Registered office: 9 Weston Chambers, Weston Road, Southend.

Official Returns of Electrical Companies.

Kye, Ltd. (formerly Spencer's (Electrical), Ltd.).—Satisfaction in full on September 4th, 1925 (*a*) of debentures dated November 18th, 1924, securing £500, and (*b*) of debenture dated August 31st, 1923, securing £1,000.

Waverham Electricity Supply Co., Ltd.—H. L. Dale, incorporated accountant, of 4, Darwin Street, Northwich, ceased to act as receiver or manager on October 2nd, 1925.

R. M. P., Ltd. — Mortgage debenture dated September 17th, 1925, to secure £100, charged on the company's undertaking and property, present and future. Holder: G. P. Power, Adderley Road, Saltley, Birmingham.

Electron Co., Ltd. — Particulars filed of £2,000 debentures authorised September 22nd, 1925, charged on the company's undertaking and property, present and future, including uncalled capital (if any), the amount of the present issue being £600.

Houghton's Electrical Engineering Co., Ltd.—Debenture dated September 23rd, 1925, to secure £400, charged on the company's undertaking and property, present and future. Holder: R. H. King, M.D., 11, Egmont Road, Sutton, Surrey.

Central Electric and Radio Co., Ltd.—Particulars filed on October 8th of £750 debentures authorised June 17th, 1925, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £550.

Victoria Electric Plant Co., Ltd.—Particulars filed of £550 debentures, authorised September 30th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Oxford Electric Co., Ltd.—Issue on August 21st, 1925, of £10,000 6 per cent. debenture stock, part of a series already registered.

Ferranti, Ltd. (83,718).—Return dated September 25th, 1925. Capital, £300,000 in 100,000 6 per cent. preference, 100,000 7 per cent. second preference, and 100,000 ordinary shares of £1 each. 71,166 6 per cent. preference, 75,000 7 per cent. second preference, and 60,000 ordinary shares taken up. £206,166 considered as paid. Mortgages and charges, £45,834.

Marconi International Marine Communication Co., Ltd. (65,759).—Return dated August 7th, 1925. Capital, £1,500,000 in £1 shares. 1,192,726 shares taken up. £1,087,726 paid. £105,000 considered as paid. Mortgages and charges, £8,140.

W. Sisson & Co., Ltd. (82,295).—Return dated August 4th, 1925. Capital, £50,000 in 5,000 preference, 38,000 ordinary, and 7,000 deferred shares of £1 each. 4,375 preference, 31,711 ordinary, and 7,000 deferred shares taken up. £28,686 paid on 4,375 preference and 24,311 ordinary shares. £14,400 considered as paid on the remainder. Mortgages and charges, £3,949 6s. 1d., due to Lloyd's Bank, Ltd. (overdraft limit, £15,000).

Yorkshire (Woollen District) Electric Tramways, Ltd. (71,916).—Return dated June 23rd, 1925. Capital, £500,000 in 250,000 preference and 250,000 ordinary shares of £1 each. 220,000 ordinary shares taken up. £220,000 paid. Mortgages and charges, £34,800 (issued to bank as collateral security).

Foster & Pullen, Ltd. (108,579).—Return dated August 21st, 1925. Capital, £5,000 in £1 shares. 4,436 shares taken up. £2,436 paid. £2,000 considered as paid. Mortgages and charges, £500.

British Arc Welding Co., Ltd. (108,759).—Return dated August 21st, 1925. Capital, £50,000 in £10 shares. 1,474 shares taken up. £12,740 paid. £2,000 considered as paid. Mortgages and charges, nil.

Christy Brothers & Co., Ltd. (90,039).—Return dated September 4th, 1925. Capital, £40,000 in 32,000 ordinary, 3,000 deferred, and 5,000 preference shares of £1 each. 28,406 ordinary, 3,000 deferred, and 4,250 preference shares taken up. £25,856 paid. £9,800 considered as paid. Mortgages and charges, £5,600.

Tangent Tool Engineering Co., Ltd.—Debenture dated October 2nd, 1925, to secure £2,200, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: W. H. Welch, Redcliffe Street, Bristol.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Agricultural and General Engineers, Ltd.

In the course of his address at the annual meeting on October 16th, Mr. G. E. Rowland (chairman) said that, although it lay within their powers, they had decided not to ask any of their associated companies which had made profits to declare a dividend, as those profits were being employed in further profitable work. For the same reason no interest had been charged upon advances made to the associated companies. Although originally the manufactures of the group consisted of agricultural implements and general engineering products, at the present time the companies produced, apart from almost every implement used in farming, everything in the engineering line from a split pin to large boilers and power plants. In spite of the depression in industry and in the face of great difficulties, the group had increased its sales by 32 per cent. in two and a-half years. If the sales could be increased by 12½ per cent. the concern would become a consistent dividend-earning one. Among the new products which members of the group were turning out were trackless tram motors made by Bull Motors, Ltd., in addition to its range of industrial d.c. motors, and electric trolley 'buses by Messrs. Garretts, which were equipped with "Bull" traction motors. Special attention was being paid to foreign markets, especially those of Latin America, and an organisation had been set up in Argentina.

Prospectus.

Pettigrew & Merriman (1925), Ltd.—This company, the registration details of which were given in our "New Companies Registered" last week (p. 628), has been advertising inviting subscriptions for an issue of 125,000 7½ per cent. cum. preference shares of £1 each at par. The list was to close on or before October 21st. The company acquires as a going concern the business of Pettigrew & Merriman, Ltd. (incorporated in 1919), and all the issued capital of Pettigrew & Merriman (Continental), Ltd., together with the manufacturing business and undertaking of Brunet et Cie., of Paris, makers of the well-known "Brunet" headphones, transformers, and loud speakers. It is stated that the total net assets amount to £233,900, and that the present rate of profits covers the preference dividend six times over. It is stated by M. Paul Brunet that over 1,000,000 headphones have already been sold —350,000 in Great Britain, 250,000 in France, and so on.

Swiss Companies.

The report of the *Bank für Elektrische Unternehmungen*, of Zurich, for the year ended September last shows a net profit of 256,873 fr. A dividend of 8 per cent. is being paid on the "A" and "B" shares, as against 7 per cent. for the preceding year.

The *Motor Columbus Gesellschaft für Elektrische Unternehmungen*, of Baden, is paying a dividend of 9 per cent. for the last financial year, the same as for 1923-24.

The report of *Escher, Wyss & Co.*, of Zurich, for the year ended March 31st last states that the principal activities of the company during the year were in the hydraulic and steam turbine departments. Among the work turned out was a number of Francis turbines of from 10,000 to 15,000 h.p. for hydro-electric stations, ten steam turbines of between 10,000 and 15,000 h.p., at 3,000 r.p.m., and three 30,000-h.p. sets, 1,500 r.p.m., one of the last being for the central station of the Compania Hispano-America in Buenos Aires.

Belgian Company.

The report of the *Société des Constructions Electriques de Belgique*, of Liége, for the year ended June 30th last shows a net profit of 2,860 fr., which reduces the debit standing in the balance-sheet to 761,302 fr. The business is now being mainly carried on in new works at Herstal, which are fully engaged. The old works in Liége are being used for the manufacture of small motors and electrical apparatus. The report states that the arrangement entered into in 1920 whereby, in return for part of the profits being payable to the Société des Constructions Electriques de France, the Belgian company obtained the technical support of the French company and of the English Electric Co. has been modified. The Belgian company thus becomes an entirely free agent as regards export trade. The Ghent branch of the undertaking has also been formed into a separate company to be known as the Société des Anciens Ateliers van den Kerchove.

Argentine Light and Power Co., Ltd.

The annual meeting was held on October 16th. Mr. W. S. Poole, who presided in the absence of the chairman (Sir George Touche) through ill-health, said that, generally, the position of Argentina during the past year had improved, especially in the Province and City of Cordoba, in which the bulk of the company's business was carried on. The latest census showed a considerable increase in the population of Cordoba and Santa Fé. The gross receipts of the combined businesses in those two provinces for the year ended March 31st last were £529,148 and the net receipts £264,822. During the first six months of the current year substantial improvement had been shown, and present indications were that little, if any, steam operation would be necessary in Cordoba during the remainder of the year. They were able to declare a dividend of 2½ per cent. upon the ordinary shares.

International Light and Power Co., Ltd.

The income during the year ended June 30th last was £73,399, as compared with £70,612 in the preceding year, and after meeting expenses and crediting £30,433 brought forward, the available balance is £70,431. Of this, £2,500 is transferred to the contingencies reserve, the arrears of preference dividend are paid, and a balance of £14,382 is carried forward. It is stated that the business of the four subsidiary companies has been satisfactory and has expanded, although Mexican conditions have been very unsettled. This precludes the installation at present of the generating plant which is urgently needed. The company has acquired the share capital of the Southern Brazilian Railways Co. by means of a note issue of £128,000. A meeting of English shareholders is to be held on October 26th.

Montevideo Telephone Co., Ltd.—The report for the year ended July 31st, 1925, shows that after providing for all charges in Montevideo and London, and making provision for income tax and Corporation Profits tax, the net profit was £32,832. The available balance including the sum brought forward is £40,440. After transferring £15,000 to the reserve fund, a final dividend of 5 per cent. is recommended, making, with the interim dividend already paid, 7 per cent. for the year, less income tax, leaving £14,583 to be carried forward. The business of the company continues to make satisfactory progress. During the year the number of stations was increased by 839, making a total of 13,462 stations as at July 31st, 1925. Meeting: London, October 26th.

Stock Exchange Notices.—Application has been made to the Committee to allow the following to be officially quoted:—

American Telephone and Telegraph Co.—$4,904,400 capital stock.

Brisbane Tramway Trust.—Stock and partly-paid scrip for £500,000 5¼ per cent. Brisbane Tramway stock, 1944-1954.

Dealings in the following have been specially allowed by the Stock Exchange Committee under Rule 159:—

American Telephone and Telegraph.—$4,904,400 capital stock in shares of $100 each.

Newcastle-upon-Tyne Electric Supply.—32,250 5 per cent. preference shares of £1 each, fully paid, Nos. 1,499,768 to 1,532,017.

English Electric Co. of Australasia, Ltd.—The report for the year ended March 31st last records a net profit of £22,047, as compared with £37,501 in the preceding year. A dividend of 5 per cent. has been paid; in 1923-24 the rate was 10 per cent. The sum of £3,556 is transferred to the reserves, making these £41,589. Standard-Waygood, Ltd., the capital of which is held by the company, has declared a dividend of 15 per cent.

Stothert & Pitt, Ltd.—The report for the year ended June 30th last states that, although the depression in the engineering trade continued, there was a considerable improvement in the company's business. The profit for the year was only £191. To this was added £122 brought forward and £3,000 was taken from reserve, and after paying the preference dividend a balance of £196 is carried forward.

Brampton Bros., Ltd.—The report for the year shows a net profit of £15,029, and with the sum of £11,873 brought forward there is an available balance of £26,902. A dividend of 10 per cent. is declared on the ordinary shares, £2,000 is transferred to reserve, and £13,202 carried forward.

Erinoid, Ltd.—It is proposed to pay a final dividend of 7½ per cent. actual, less tax, making a total of 12½ per cent. less tax, for the year.

Brazilian Traction, Light and Power Co.—Quarterly dividend of 1 per cent. on the ordinary stock.

Electrolytic Zinc Co. of Australasia.—The gross profit for the year ended June 30th last was £510,073, and the net profit £375,380. To the latter amount was added £98,920 brought forward, making £474,301. The allocations include £40,000 to reserve, dividends £216,269, and £165,932 carried forward.

Callender's Cable and Construction Co., Ltd.—A dividend of 1s. per share actual, less tax, has been declared on the ordinary shares, as in 1924.

River Plate Electricity Co., Ltd.—An interim dividend of 3 per cent. has been declared on the ordinary stock.

Stocks and Shares.

Monday Evening.

Light depression has occurred amongst investment stocks in consequence of the stiffening of money market rates. This is regarded as a seasonal event, and it would attract no particular attention were it not that the Bank Rate had been unexpectedly lowered to 4 per cent. on the first day of the present month. While the gilt-edged issues are dull, however, the good-class industrials maintain their prices, and, in some cases, have improved upon their last week's quotations.

At a time when money is so much needed in this country for purposes of electrical expansion and extension, it is a little remarkable—not to say anomalous—to find that substantial amounts of British capital are being utilised in the purchase of American industrial stocks, shares and bonds. Several firms are placing considerable blocks of such issues over here. It is a fairly open secret that United States financiers have been on the alert for some time past to obtain a footing in this country's electrical enterprise. In the main, the overtures have met with an exceedingly chilly response, and, in default of acquiring a considerable interest in big British business, Americans are now offering utility securities, made across the Atlantic, upon terms that may appear attractive when compared with those obtainable from the home-grown stocks. Experience and caution hold out a warning, however, against temptations to invest money in issues that may prove to be of a different calibre from those of the British companies. Nor is it only safety of capital that dictates the desirability of retaining money for electrical purposes in this country. Employment and industry are both dependent to a large extent upon the provision of capital for electricity undertakings in Great Britain.

Cable and Telephone descriptions stand out with marked firmness in this week's lists. Indo-European shares are £2 higher at 44½ and are still wanted. The Eastern stock and shares retain their last week's gains. Anglo-American deferred has risen 10s. Amongst telephones, United River Plates are 3/16 higher at 7½ and the new shares have reached 40s. premium. Monte Video Telephones firmed up to 1½; the company has increased its dividend from 5 per cent. to 7 per cent. Jutland Telephone 5½ per cents. advanced to 101, and British Columbia Telephone Sixes at 102½ have put on 3 points. No changes took place in wireless, except for a few halfpence decline, to 6s. 9d. sellers, in Canadian Marconis.

Callender's Cable has declared the usual 5 per cent. interim dividend, and the price is unchanged at 3 3/16. India Rubbers are a little easier at 20s. 7½d. Metropolitan-Vickers ordinary picked up to 23s., and there is a good deal doing in the shares. Edisons reacted to 7s. 6d. A brisk rise lifted Johnson and Phillips to 50s. 9d., thus wiping out last week's loss. The engineering and allied shares keep hard, various rises being registered on the idea that the trades are to benefit from some possible extension of the Safeguarding of Industries Act.

In the London lighting group, County ordinary are on offer at 56s. 6d., and Citys at 47s. 6d., a thousand of each being obtainable at these prices. London Electrics can be bought at 34s. 6d., and Charing Cross at 2½. Metropolitan ordinary are quoted at 39s. 6d. middle, but 1,000 are available at 38s. 6d. Newcastle-on-Tyne have gone back 6d. to 22s. Amongst provincial ordinary shares now to be obtained are Folkestone at 39s. 6d. xd., Llanelly at 26s. 3d., Midlands at 22s. 9d., Shropshire "A" at 27s. 6d. and "B" at 25s. Egham and Staines new ordinary stand about 22s. 6d., Fife Trams at 24s., and Yorkshire Electric Power at 29s. 6d. There is a tolerable amount of stock on offer at the moment in the ordinary shares of electricity supply and traction companies.

Brazilian Tractions have been moving rapidly and irregularly. From 77 the price jumped to 82½, after which it fell back to 78½, leaving a net gain of 1½ on the week. The other foreign issues are unusually quiet, and the domestic stocks show no movements. Amongst Undergrounds, the only change is a point rise to 103 in Underground Electric 6 per cent. income debenture stock, which is not to be confused with the same company's 6 per cent. income debenture bonds, standing at 97.

The main feature in the industrial section continues to be the activity in rubber shares. Speculators were shaken out sharply last week, when a fall in the price of the product led to extensive selling of the shares. Both recovered without much difficulty. The wildness of the rush to buy rubber shares has given way to quieter conditions, but the fortnightly settlement, this week, is once more on a gigantic scale. The City lighting companies will gain more satisfaction than Stock Exchange staffs from the quantity of current required to illuminate work that will go on in many offices until midnight, at the earliest, every day (or night) in this week.

Exports and Imports of Electrical Goods and Machinery in September, 1925.

The mere comparison of the total value of electrical goods and apparatus exported during September with the totals for August and September, 1924, gives the impression that satisfactory progress was made. Upon a more detailed examination, however, it is seen that had it not been for an abnormal increase under the heading "Submarine telegraph and telephone cable" (a violently-fluctuating factor), another fall would have been recorded amounting to about £115,000 in comparison with August, and to about £160,000 in comparison with the total for September, 1924. In making these two comparisons it will be observed that only five and four items respectively showed increases, all the remainder being lower—seriously lower in many cases. The figures show a healthy position so far as the cable industry is concerned, for apart from the submarine section, cables under two other heads ("Insulated wires and cables" and "Telegraph and telephone wires and cables by £44,576. The principal decreases occurred in the items "Electrical goods and apparatus (unenumerated)," £26,964, and meters and instruments, £80,613, as well as the decrease in the case of telegraph and telephone cables mentioned above.

In the import section the total indicated a slight increase as compared with the August total, while there was an increase of nearly £22,000 in comparison with the figure for September, 1924. Increases and decreases were about evenly divided, the former including £12,685 in the case of batteries and accumulators and £11,542 in connection with insulated wires and cables. The principal decrease was a fall of £13,050 in respect of glow lamps. The increase as compared with September, 1924, was very general, there being only three items which showed a decline. One of the latter—telegraph instruments and apparatus—provided the largest variation, a fall of £36,763; the greatest increase occurred under the heading "Batteries and accumulators" (£32,608).

Totals	£1,536,243	+ £270,073	+ £260,932	£433,293	+ £2,889	+ £21,814	£15,796	+ £727	− £4,437
Increases for the nine months ended September, 1925	Exports. + £2,288,468			Imports. + £867,353			Re-exports. + £38,260		

able, not submarine") showed satisfactory increases. The other two increases—"Electrical goods and apparatus (unenumerated)," and "Arc lamps and parts"—were not of important dimensions. The largest actual decrease occurred under the heading "Electrical machinery (unenumerated)," although proportionately the fall in the exports of railway and tramway motors was the most serious. The exports of meters and instruments, and glow lamps were halved, and large decreases were also recorded for batteries and accumulators, and telegraph and telephone instruments and apparatus. The export total for the three complete quarters of the current year shows a good increase as compared with the figure for the first nine months of last year, but it should be mentioned that more than half of this increase is due to a rise of £1,305,220 in the value of exported submarine telegraph and telephone cable. On the other hand, non-submarine telegraph and telephone cable decreased in value by £262,764. Electrical machinery exports increased in value by £550,460, telegraph and telephone instruments and apparatus by £392,996, batteries and accumulators by £238,673, electric lamps and parts by £128,388, and insulated

There is little of interest in the re-export section, with the possible exception of the decline of £4,437 in the total as compared with the September, 1924, figure.

The Irish Free State and Foreign Contracts.—Mr. Kevin O'Higgins, Minister for Justice, in the course of a recent speech, referred to what he described as a secret organisation in connection with the Shannon power scheme, the object of which was "to combat certain anti-British trade tendencies" which were supposed to be manifesting themselves within the Free State. "There are no anti-British trade tendencies here that I am aware of," declared Mr. O'Higgins. "You have an undeveloped country lacking in many respects that technical equipment which should enable its own citizens to take the initiative in schemes of improvement and development. Other countries have realised that and have been quick to make, either to the Government or to local authorities, proposals which seemed mutually advantageous. That is why there are Belgians in Carlow, Germans in Limerick, and Frenchmen about to install an improved cleansing system in Dublin. No rival proposal was forthcoming in these matters from British sources, and when British engineers or commercial men have the vision to see and the initiative to undertake and exploit the opportunity they will find the same readiness to do business with them."—*Daily Telegraph.*

Electrical Exhibitions and Showrooms.

Recent Developments in Local Undertakings.

Since the appearance of the article under this heading in our last issue, additional information has come to hand concerning several of the recently inaugurated showrooms, &c. The most interesting developments are the opening of the lighting service bureaux at Glasgow and Newcastle. These make three of their kind now in the United Kingdom. The addition of the two in the North will, we feel sure, greatly assist in and extend the good work which is being done by the parent institution in London.

The New Hackney Demonstration Halls.

Following the description of these halls in our last issue some additional photographs of the premises add considerably to its interest. The building, fig. 1, is of a simple yet pleasing and dignified design. The extending flat-roofed loggia forms a platform above, 65 ft. by 16 ft., suitable for

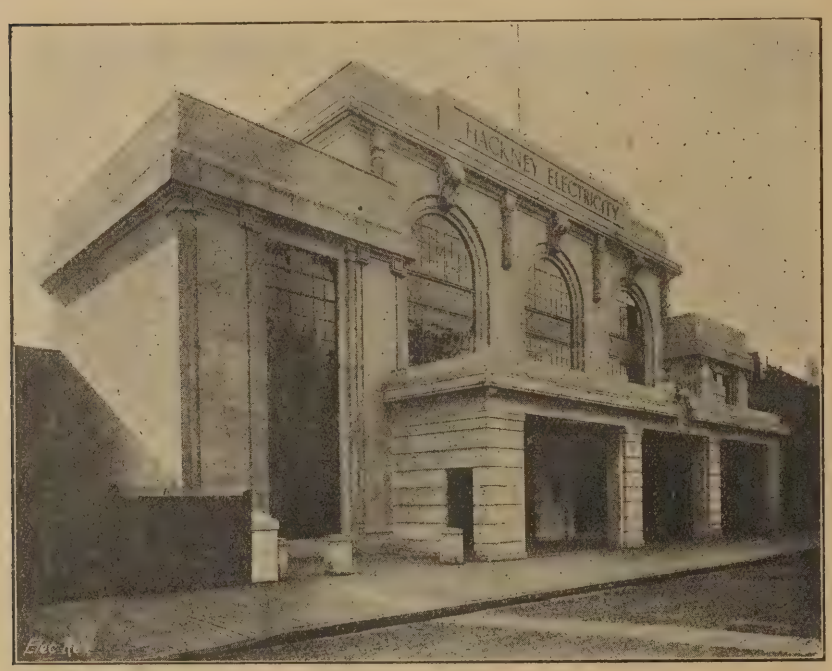

Fig. 1.—Hackney Showrooms.

advertising schemes, and at the same time effectively darkens the exterior of the main display windows. These windows are arranged to suggest in a theatrical manner what electricity can perform. A notable feature is that not a single light fitting can be seen by the onlooker on the front of the building,

Fig. 2.—Vestibule Hall.

the floodlights being effectively concealed. At either extremity of the vestibule hall, fig. 2, are arranged an inquiry and accountant's offices, each forming a wing at the frontage of the main building. On entering the lecture hall, fig. 3, from the vestibule, one might easily imagine himself in a theatre or similar place of entertainment, this being the atmosphere which it is desired to create. Fig. 4 shows the model bedroom.

In the spacious offices above the showrooms several new departures from the usual practice have been instituted. A special room has been set apart as a waiting room and library for the committee and staff, the main object being to establish a place in which the technical journals, &c., may be at all times available to the staff and others interested. A committee room is also provided, it being suggested that a suitable atmosphere is created for the committee when sitting if it is at the electricity headquarters proper.

A staff all-electric kitchen, where meals are prepared and cooked, is another interesting feature. It is intended to invite prospective consumers, when visiting the model kitchen on the ground floor, to see for themselves food being cooked in the normal routine.

The new showrooms mark the development of a very necessary line of thought in connection with the electricity supply industry—that of supplying service rather than a commodity. It is the intention of the Hackney undertaking to carry out an educational campaign on novel lines.

The Lighting Service Bureau at Glasgow.

We referred briefly to the inauguration of the Scottish Electric Lighting Service Bureau at Glasgow in our issue of last week. The Bureau is an organisation sponsored by the Glasgow Corporation Electricity Department, the Electrical Contractors' Association, the Electric Lamp Manufacturers' Association, the supply undertakings and other electrical interests in Scotland. Most of the large cities in Scotland are also co-operating in the scheme.

Its object is to further the cause of lighting by electricity through the agency of a lighting service bureau at 20, Trongate, Glasgow.

Lectures and demonstrations will there be given to those directly interested in lighting, and the demonstration rooms, fig. 6, will be open to all and any who wish to become acquainted with the latest practice in electric lighting for any application. Examples of the correct methods for industrial purposes, shop interiors, illuminated signs and posters, the flood lighting of buildings and street lighting, will all be shown and explained.

There is also a fine example of an illuminated shop window depicting the old and new methods of lighting and giving a practical illustration of what can be accomplished by the use of coloured light. Flood lights and spotlights are included in this model shop-window equipment, while the window, with its display dressing for a drapery shop, lends itself in a remarkable manner for this purpose.

Fig. 3.—Lecture Theatre.

Home lighting will be demonstrated on novel lines. An alcove has been arranged in order that good and bad lighting can be demonstrated in all the principal rooms in the

home by the quick interchange of furniture and lighting effects.

The committee of the Bureau, under the chairmanship of Mr. S. B. Langlands, manager of the Corporation Lighting

Fig. 4.—Model Bedroom, Hackney.

Department, has made use of the experience of the Lighting Service Bureau in London, 15, Savoy Street, Strand, and the new demonstration rooms are modelled somewhat on the lines followed there. There are, however, several things which have lent themselves to different treatment and the Scottish Bureau can claim to have excellent equipment in every way. There is every reason to expect that the hopes of those interested in bringing about "a brighter Scotland" will soon be on the way to fulfilment.

The fundamental principle of doing away with glare from the new gasfilled lamp will be stressed on all occasions, for it is felt that great harm has been done to the cause of electric lighting by ignorance in this matter, which has resulted in painfully wrong methods of installation.

The Bureau is a permanent establishment and will be in charge of Mr. Henry L. Hughes, in the capacity of district engineer, and its purpose is purely educational, all modern types of lighting apparatus being shown and their uses explained, leaving the existing selling agencies to deal with the commercial side.

At the opening ceremony on October 12th there was a large attendance of gentlemen interested in electric lighting in its many phases. The chair was occupied by Mr. S. B. Langlands, who introduced Lord Provost Montgomery, and in doing so expressed the hope that the movement they were inaugurating that day would soon spread all over Scotland and that "a brighter Glasgow" and "a brighter Scotland" would be the result.

Fig. 6.—Demonstration Room, Glasgow Bureau.

The Lord Provost, in opening the Bureau, said the movement for better lighting was one that deserved support. They might have a great quantity of light, but if that light was not properly diffused it might be very imperfect. The Bureau was set up for the purpose of informing the public as to the proper appliances to use and the correct methods on which to use them to get the very best results from the electrical energy they consumed. The Corporation began by giving them the electrical energy at a very modest rate. His Lordship's slogan had always been "Give us cheap light." They had very cheap electricity in Glasgow. They had an example in their rooms of what could be done in the way of shop window lighting, and it was up to the enterprising business man to see what could be done in that direction. In regard to workshops, too, too much importance could not be attached to the lighting, for a workman could not be expected to give his best results without good light. He remembered it was stated on one occasion by the Home Secretary that improved lighting in workshops resulted not only in the improved health of the workers, but also in increased output of work. He said he was glad the Corporation had gone in for the electric lighting of tenements, and in conclusion he wished the Bureau every success.

Dr. Dewar, convener of the Corporation Electricity Committee, presented the Lord Provost with an electric reading lamp in glass.

Mr. W. E. Bush, manager of the Lighting Service Bureau, London, also spoke, giving an interesting account of the objects of the movement, as well as a demonstration of lighting.

Mr. Sully, director of the E.L.M.A., also spoke.

On October 15th a meeting of the Glasgow shopkeepers was addressed by a representative of the Corporation Electricity Department, who emphasised the cordiality of his department towards the "Brighter Glasgow" movement, and explained the exceptionally favourable terms on which the Corporation was prepared to supply the energy for "after-hours" illumination and the very low hire rate of an automatic time switch for cutting off the supply at any given hour. A committee of leading shopkeepers was formed to carry out suggestions put before the meeting.

Fig. 5.—Metro-Vick Stand at Salford.

The North-East Coast Lighting Service Bureau.

The new Lighting Service Bureau for the North-East Coast was formally opened at Dial House, Northumberland Street,

Fig. 7.—Illuminated Tramcar, Leicester.

Newcastle-on-Tyne, on October 13th, by the Lord Mayor of the city (Ald. Walter Lee). Like the similar and new institution at Glasgow, it is another development of the Lighting Service

Bureau of London, making three of its kind in the kingdom. The value attached to the scheme, which aims at demonstrating the best mode of modern lighting, is indicated by the fact that the effort is being maintained by the following interests:—The Newcastle-upon-Tyne Electric Supply Co., Ltd.; the Newcastle and District Electric Lighting Co., Ltd.; the Tynemouth, South Shields, Sunderland, Darlington, Middlesbrough, Carlisle, Stockton and West Hartlepool Corporations; and the North-East Coast sections of the Electrical Wholesalers' Federation, the Electrical Contractors' Association, the Electrical Lamp Manufacturers' Association, and the Electrical Development Association.

The commodious premises are so arranged that they can represent a workshop with the lighting necessary for such an establishment installed, while modern methods of lighting shop interiors and shop windows can be shown with facility. One feature of interest to shopkeepers shows the bad effects of bare lamps hanging in the windows and how to eliminate the glare by the use of properly designed reflectors. The Bureau is in charge of a district engineer, and arrangements are being made to invite electrical contractors, engineering societies, technical schools, architectural associations, and similar bodies to demonstrations. The rooms are provided with equipment for dealing with the following fields of illumination:—Lighting of factories and workshops, street lighting, lighting of public buildings, flood lighting of buildings, electric signs, and domestic lighting.

Dr. W. M. Thornton, M.I.E.E., presided at the opening proceedings. He said that there was no need to dwell on the importance of utilising to the full the best methods of lighting which science and experience had developed in the last few years. It was not only a question of having a bright light, but one of having a right light. The influence of light on health had become known during the last ten years, and there were clinics in most large towns where children suffering from rickets and skin complaints could be treated by electric light. That was a great work, and might in time revolutionise life in densely populated quarters of towns. The Bureau, also, served as a kind of clinic, to which those who suffered from the wrong sort of lighting might take their complaints. It was established to show what was right and what was wrong in the methods of lighting the public used. The first bureau of the kind to be started was in New York, and he had the pleasure of visiting it sixteen years ago; all the great manufacturing firms pooled their information for the public good, and the work had spread all over the world since. There was an excellent bureau in London, and since Newcastle was the electrical centre of gravity of the British Isles it was right and proper that they should have one there.

The Lord Mayor, in declaring the Bureau open, said all sections of the community using electric light would appreciate the services to be rendered by the experts associated with that Bureau. He wished the undertaking all success. The objects of the Bureau were explained by Mr. W. E. Bush, of the Lighting Service Bureau, Savoy Street, London, and Mr. C. W. Sully, director of the Electric Lamp Manufacturers' Association.

The Salford Electrical Exhibition.

In connection with the opening of the new Agecroft electricity generating station at Salford on September 23rd, a description of which appeared in the Electrical Review on September 25th, the Salford Corporation held an electrical exhibition in the Pendleton Town Hall. The show proved of considerable interest and an excellent display of electrical apparatus of every description was given. A very comprehensive display of electrical domestic appliances was found at the stand of Metro-Vick Supplies, Ltd., fig. 5, the new "Cosmos" cooker of this firm, and its Harcourt fittings and wireless sets being the main features.

The Electrical Exhibition at Leicester.

In connection with the recent electrical exhibition held at Leicester, an account of which we included in a similar article in our issue of last week, it is interesting to learn that the Leicester Corporation Tramway Department rendered considerable assistance to the exhibition authorities in their efforts to bring success to the show. Fig. 7, p. 673, is a view of the illuminated tramcar which was attractively decorated to give publicity to the concern. During the period of the exhibition it was run over the chief routes of the city as a mark of the Corporation's high appreciation of the value of the exhibition to the city.

We understand that arrangements are being made to repeat the exhibition on a very large scale early in 1927.

Smoke Abatement.

A Conference at Buxton.

(*Concluded from page* 636.)

On the Saturday evening the annual dinner of the League was held with Sir Napier Shaw, F.R.S., Chairman of the Advisory Committee on atmospheric pollution, as President. Sir Napier proposed the health of the League, to which toast Mr. Melland and Mr. Elliott (hon. secretary) suitably replied. The meetings on the Sunday were divided into two sections. In the morning the question of domestic smoke abatement was dealt with and in the evening attention was directed to industrial smoke. Three papers were given in the morning session, one by Dr. Margaret Fishenden, of the Department of Scientific and Industrial Research, another by Mr. Thomson, F.R.I.B.A., who described the Logie housing scheme at Dundee, and the third by Ex-Bailie W. B. Smith, O.B.E., who dealt with the new smokeless fuel plant erected by the Glasgow Corporation at the Dalmarnock Gas Works.

Dr. Fishenden's address was chiefly devoted to an exposition of the possibilities of coke and the necessity of gaining the co-operation of architects, builders, grate manufacturers, & Dr. Thomson, the Dundee city architect, gave a most interesting account of the Logie scheme, an important feature of which is the central installation for the heating of the dwellings and supplying hot water for domestic purposes. He stated that the cost of the installation was more than saved by the economies effected in such things as grates, fenders, circulating tanks, &c. The calorifiers served a double purpose in that they supplied hot water for the baths and wash-houses which it was necessary to have for the houses in the neighbourhood which were not centrally supplied. He appraised the scheme on account of the labour saved, its cleanliness and its economy. The tenants were supplied with hot water at 160 degs. at any time of the night or day and each room had its separate radiator. A communal laundry had been built with the idea of dealing with the larger articles, and in the houses all the latest labour-saving devices were installed including rotary washers, electrically driven. Ex-Bailie W. B. Smith gave a brief description of the working of the smokeless fuel plant on the Maclaurin system erected at Dalmarnock. He stated that from one ton of coal they were extracting 8 therms of gas, 15 to 16 gallons of oil, and 11 cwt. of smokeless fuel. The fuel was being sold at 30s. per ton and it was hoped through the additional gas supply to be able to serve manufacturers at such a rate as would allow of the boilers being gas-fired, with the consequent reduction of the smoke nuisance. He stated that the plant only was responsible for the low capital and working costs and in every way it had been successful and an economic proposition. The meeting was then thrown open to discussion on the three papers which were taken in order. Some remarks were made in regard to ventilation arising out of Dr. Fishenden's paper, and one medical officer warned the Conference not to save fuel at the expense of health. He reminded those present of the dangers of going from a hot room into the cold air outside.

In regard to the Logie scheme, another medical officer raised the question of correct ventilation, saying that with central heating there was a down-draught on the heads of the persons occupying the room and this could be proved by the dirt marks upon the walls. Central heating induced a feeling of lassitude. It had been found necessary to revive the lagging energy of those subjected to radiator heating for long hours. He held strong views on solar radiation and central heating was the one way to eliminate this benefit; the coal fire and even the gas stove were much better. In the course of his reply, Mr. Thomson stated that during five years, there had been no complaints and so far as he was aware not the slightest ill-effect had been noticed.

On the Sunday evening Dr. R. Veitch Clark was in the chair, and in the course of his opening address alluded to the impracticable nature of the present methods of dealing with the smoke nuisance. Large smoke areas with one single controlling authority should be established, in his opinion, and it was necessary for all to co-operate. The country required new sources of power; electricity should be developed, as in this lay the secret of the industrial revival.

Mrs. Claudesley Brereton read a paper which was the result of a questionnaire with which she had approached a number of industrialists. One question was, would it immediately or ultimately increase your firm's costs to abolish smoke? Many firms answered in the negative: It would not in their opinion, be possible to scrap existing machinery but in the gradual development of industry the smoke nuisance would be gradually abated as the emission of smoke always meant the loss of valuable products.

Mechanical stoking was highly spoken of, and with regard to oil, gas and electricity, some useful data were obtained. Coal had only one really sound believer, gas was more fortunate and in regard to electricity, Messrs. Boot's replied: "The whole of our factory is driven electrically and supplied from our own central power house, where modern plant is installed which has reduced the smoke nuisance to a minimum."

Mrs. Brereton, in summing up her proposals, suggested that the Minister of Health should appoint permanent committees, each including a fuel expert, to advise him as to the minimum of smoke which it was practicable to emit; and that these committees should be invited to draw up instructions to show by what methods it was practicable to reduce smoke to the standards set up on their recommendation. Mrs. Brereton concluded by saying: "Effective legislation should be practical and not impose new burdens upon industry at this unfitting moment."

A short concluding meeting was then held at which the proceedings of the conference were summed up and an announcement was made that in all probability another conference would be held at Glasgow in the spring.

The British Empire Exhibition.—It is announced that as there is no intention of continuing the British Empire Exhibition after October 31st, liquidators are to be appointed as soon as possible to wind up affairs. It is thought probable that the recently-appointed Realisation Committee, under the chairmanship of Mr. J. H. Thomas, will be asked to undertake the duties

The Textile Machinery Exhibition, 1925.

A Review of the Electrical Features of the Manchester Show.

The many exhibits on view at the City Hall, Manchester, which housed the Textile Machinery and Accessories Exhibition from October 2nd to 17th, revealed the progress that is being made in the application of new ideas in many directions. Changes are being proposed which, in some cases, will involve a radical alteration of established principle, but, notwithstanding much misapprehension, it can safely be said that (except perhaps in the case of one or two European countries, and then only with regard to particular classes of machinery) there is no serious challenge to the supremacy of the British manufacturer. Whilst trade conditions in the textile industries have not been stabilised for the last four years, there are signs now of distinct improvement and the fact that another large cotton crop is more than likely this year will undoubtedly stimulate the trade, not only in this country, but throughout the world. The new machinery for the production of and subsequent processes connected with artificial silk, or, as it is better termed, "rayon," is being produced in large quantities by foreign firms, and in this particular connection British textile machinists will do well to lose no opportunity; in practically every other department there is no question as to the supremacy of Britain.

Nearly 15 per cent. of the exhibits were of foreign origin, but they were not to any great extent connected with the electrical industry. Every available space in the hall was booked, and many firms were refused space.

Lancashire Dynamo and Motor Co.

It is unfortunate that a.c. was not laid on to the exhibition hall, and the promoters (the *Textile Recorder*) had no alternative but to incur the expense of installing a motor-alternator of 00 volts, 60 kVA, 50 cycles, 3-phase, 1,500 r.p.m., and this supplied all the a.c. power used in the building; in addition, much d.c. was used. This machine formed part of the exhibit, which ncluded "Maxtorq" motors, of the Lancashire Dynamo nd Motor Co., and the company's motors were used also to drive machinery on other exhibitors' stands.

Carver Textile Patents, Ltd.

This stand was occupied by the Carver electro-mechanical oom, fig. 1. Dr. Carver's successful abolition of cards in the ordinary jacquard weaving, as demonstrated during years of nill practice, is now succeeded by the entire and absolute upersession of the ordinary jacquard machine, together with he long cords of jacquard harnesses usually required in damask weaving. Instead of jacquard machines of varied apacity with 400, 600, 800 and 1,200 hooks, of which two and hree separate machines are mounted high above the loom to ontrol the harness cords and warp threads for producing large esigns as seen in the best table covers, the new machine is f easy access to the operative from the floor. There are no ong harness cords, no wire hooks and needles, no pasteboard ards laced together in long continuous masses, as is the case n the system in common use. All this is done away with and here will therefore be no periodical renewal of harness, no pplication of the three coats of costly varnish with the necesary three periods of drying. The staff and department for his purpose in each damask factory will be done away with, vith consequent economy.

Dr. Carver's former achievement of weaving by electrical ontact with the photographed design is now replaced by an ntirely novel re-constitution of the mechanism, the pattern eing printed direct from a tracing of the design on to the etal plate with insulated and non-insulated surfaces.

As regards the cost of the former and the new method, the reliminary cost at present for a large table cover pattern would e about £160. The cost by the new system, including the rtist's original sketch, its photographing on a thin aluminium late, completely ready for use in the loom, is about £18—a aving of nearly 90 per cent. The saving in time is equally reat. Whereas from the selection of the artist's sketch, the ransfer of the sketch by the designer to his squared paper esign, the punching of the cards by the card cutter to the acing in a continuous chain of cards occupies frequently as ong as five weeks, all that is needed by the new system is he printing by photography of the sketch on the aluminium late, completed ready for the loom in three hours. There re no faults as regards insulation. No "touching up" of he photograph on the aluminium plate by a specialist is ecessary.

In weaving a long damask tablecloth certain repetitions of gured border and centre sometimes occur. Instead of arrangng for the insertion of several repeats of ordinary jacquard ards to effect this, a hand wheel is conveniently placed in ront of the loom for the weaver to turn quickly forward or ackward. The portion of pattern to be repeated can be rranged for simply and with complete efficiency. The weaver imply turns the small handle to an easily ascertained position nd restarts the loom. Further with regard to time saved, as here are no huge masses of cards to be taken out and relaced, including transport and storage thereof, the changing f the aluminium plates can be effected in a few minutes.

There will be no need for large storage space for cards temorarily out of use, and furthermore if it is necessary to repeat he cards for a successful pattern, to put into other looms, all that is needed by the new system is anotner printed plate, done in three hours at the cost of a few pence.

The shedding mechanism is also arranged to give double lift action. The movement is so easy that the strain on the warp threads is reduced to a minimum, and the loom may be run at a speed hitherto unattainable. A damask serviette pattern of the ordinary width can be woven at the rate of 200 picks per minute without jerk or strain on the warp and with perfect production of the design. There is no trace of vibration at this high speed.

There are none of the usual lingoes or weights attached to the ends of harness cords. Frames of 40 light springs in tubes are used, which, at high speeds secure absolute freedom from swing, with a perfectly steady vertical movement of the mails and warp threads. The new system embodies every known action for warp control and is complete in itself. For its installation nothing is required beyond its fixing on and attachment by bolts to the plain loom.

The shedding mechanism is divided into self-contained frames, each controlling 40 threads, and suspended immediately above the warp, and is adjustable so that the frames can be arranged at any spacing across the loom according to the "sett" of cloth to be woven. Each of the 40 actions in one frame controls each single thread as in "full harness" so that the woven pattern is free from defects such as "steppiness" of edges of figures, and turning points of the twills in

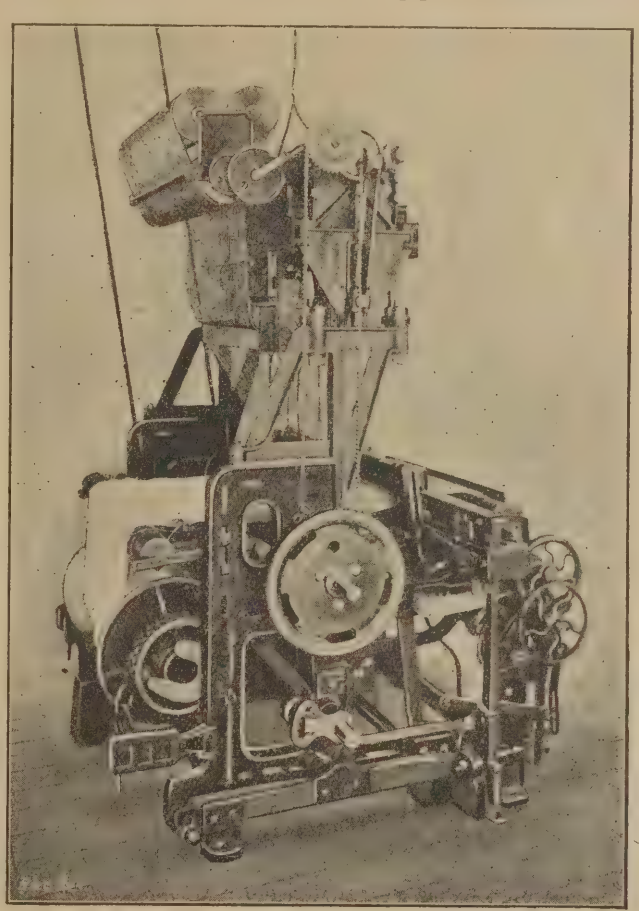

Fig. 1.—The Carver Electro-mechanical Loom.

which threads are frequently controlled in the ordinary way from the card in twos, threes and more.

The twilling is performed by cam-driven bars stretching from side to side of the loom, and the frames engage the bars in the same way, whatever the space may be. One set of twilling bars is provided and separately controlled for the figured pattern, and one other set for the ground cloth. Any twill can be independently woven in either set. For example, a 5-shaft twill can be given to the ground and a 5-shaft to the figure: or a 5-shaft ground with an 8-shaft figure, or *vice versa;* or an 8-shaft in the ground with a reversed 8-shaft in the figure; in fact, any twill or satin can be used for the pattern or ground that will divide into 40—that is 4, 5, 8 or 10.

This system of electrical reading from an aluminium plate has been brought to a high degree of perfection. The sheet metal pattern plate can be fed to the electrical reader at any desired speed in relation to that of the loom, so that when the number of picks per inch in the cloth is altered, the speed of the plate can be correspondingly changed to bring out the pattern in any desired relation of length to breadth. From the same pattern plates, therefore, cloths of varying picks per inch can be woven satisfactorily. The serviette loom shown above, fig. 1, is set for 125 threads per inch in the warp, but is easily adjustable to any required practical number of

threads. For wider looms the number of frames is correspondingly increased, but the height remains the same.

A minor but not an inconsiderable advantage secured is the freedom from oilstains on the cloth. With the ordinary jacquard system it is difficult to insulate all the lubricated parts in the overhead gear, and the black oil falling upon the yarn causes a stain which it is difficult to remove. In the new machine there is no part requiring lubrication in a position from which oil can fall upon the warp.

The fact that the new machines can be attached to plain looms enabling the finest damasks to be woven renders them of special interest to Lancashire manufacturers, as, owing to the shortage of flax during the war, cotton table damasks were largely woven by the best linen manufacturers, and they are found with the improved methods of finishing now in use to be strong competitors with the linen fabric.

British Northrop Loom Co.

This company displayed three automatic looms, one of which, the Northrop automatic four-box loom, has electrical control of the automatic weft supply. This machine is a natural sequence to the Northrop 1-shuttle automatic loom. The operation of the changing motion is as follows, see fig. 2:

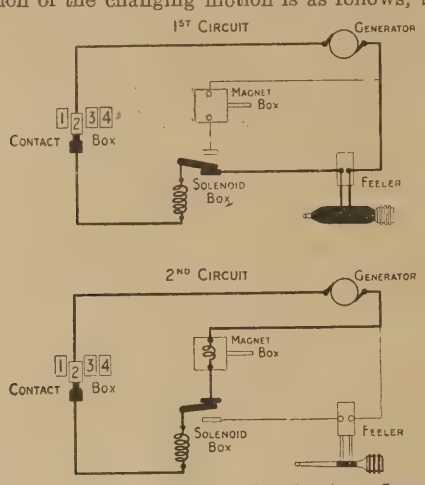

Fig. 2.—Electrical Control of Weft Supply to Loom.

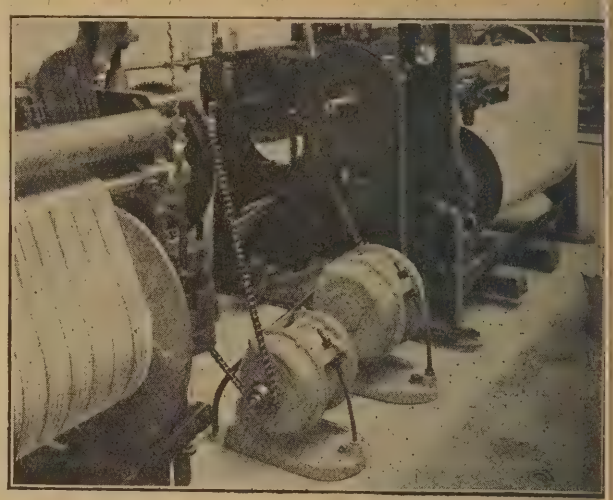
When a pattern card presses back one of the needles of the box motion it puts into circuit the solenoid which controls the weft supply for that particular box. The weft pirns are each provided with a metal sleeve which comes into contact with an electric feeler at the battery side of the sley after all but two or three picks of weft have been withdrawn from the pirn. Electrical energy then causes the solenoid to depress a small trigger, and a contact arm which is operated by a spring changes position, and by its movement breaks the first circuit and completes a second circuit. The movement of this contact arm puts the feeler out of circuit for this particular shuttle and at the same time registers the need for a new supply of weft. After the need for a fresh weft pirn has been indicated or registered by the feeler, it is immaterial whether the nearly empty shuttle remains active, or is rendered inactive for some time by the control of the pattern cards. The voltage used is low and the electrical parts are mounted on the loom as a separate unit and can be readily removed for attention. It is astonishing how little alteration in the ordinary type of automatic loom has been found necessary in order to introduce this invention which overcomes the difficulties hitherto associated with drop-box motions, and as the colour selection is controlled from the box pattern card, the maximum possible time is allowed for the change of weft to take place, this being a factor of considerable importance.

British Thomson-Houston Co., Ltd.

This company had undoubtedly the most attractive stand in the entire exhibition. Electric motors of various types, together with control equipment, were shown, and attention should be particularly directed to the 9-h.p. motor adapted for driving ring spinning frames so as to maintain the maximum permissible speed of winding the cop. Apart from many classes of power equipment, lighting fittings were suitably displayed for the guidance of the textile trades. A very large field lies in this direction, and each of the electrical firms exhibiting utilised the limited means at their disposal to the best advantage. An example of oil-immersed circuit breakers suitable for use in the stator and rotor circuits of slip-ring induction motors is shown in fig. 4. For motors up to about 200 h.p. at 660 volts, this starter, type OHM, has a face-plate starting switch supported horizontally in a removal sheet-steel oil tank with the contacts face downwards at t bottom of the tank so that the circuit is broken in oil and sludge or deposits from the oil can lodge on the contact fac The resistance wire is wound on porcelain between the swit and the top of the starter, and is so arranged that the uni longest in circuit are at the bottom and therefore in the coole part of the oil. The contact segments are reversible and renew able, and pivoted controller-type contact fingers (wi renewable tips) are fitted to the switch arm. The combinati of a "dead man's" handle and a step-by-step slow-moti device ensures a pause on each contact and a quick moveme between each; interlocking features are included.

For smaller slip-ring motors, up to about 200 h.p. at fro 400 to 600 volts, drum-type starting pillars, as exemplified the type ATP, fig. 5, meet requirements in many instanc for the driving of textile machinery. A feature is that t contactors cannot be held closed when passing from the "run to the "off" position. Terminals provide for remote pu buttons to be fitted for stopping as well as for "inching purposes. "Inching" by means of the push button can on



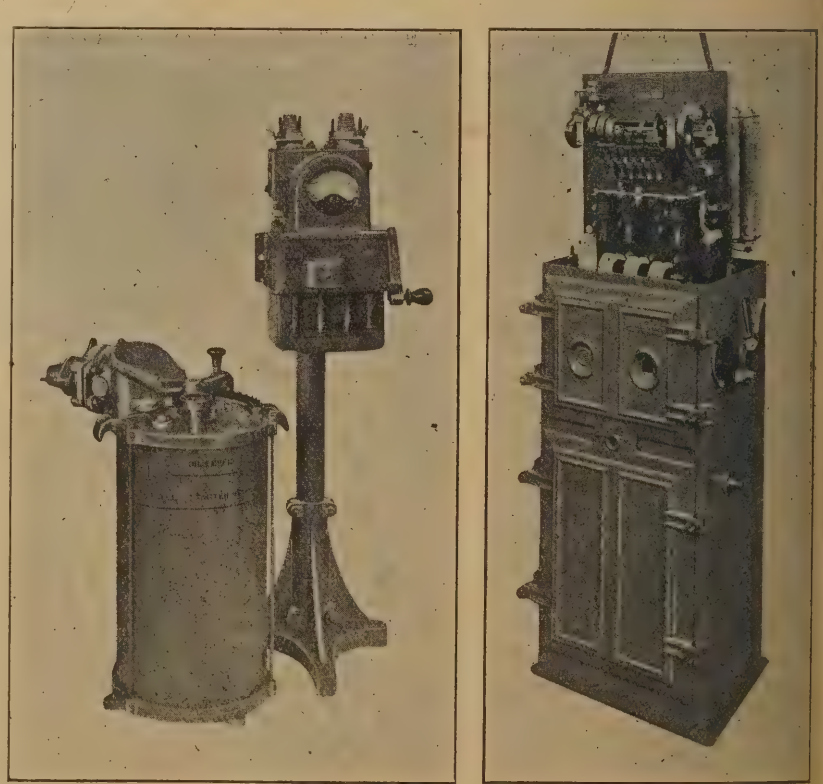


Fig. 3.—Renold Loom Chain Drives.

be carried out when the handle is in the "start" positio and, alternatively, "inching" can be done by alternatel gripping and releasing the starting handle.

Hans Renold, Ltd.

On a very large stand the following were exhibited: On 420-h.p. drive arranged with three strands of chain 7.1 in. wid on wheels of 17 and 68 teeth respectively, the larger running at 12.75 r.p.m. The drive was driven from a 3-h.p. motor running at 1,225 r.p.m. by a chain 1.2 in. wide on wheels of 1 and 114, the two reductions being made on wheels of 19 and 76. The small motor drive by segmental bush chain was enclosed in a gear-case fitted with a pump and sump.

Figs. 4 and 5.—B.T.-H. Oil-immersed Rotor Starter and Pedestal Oil-switch (left) and Drum-type Starter (right).

In addition, two complete individual loom drives were shown fitted with the Renold slipping device, which absorbs the shocks due to "bangs off," and improves the quality of the weave. The illustration, fig. 3, is of individual loom drives by Renold bush roller chains at a motor speed of 960 r.p.m. and a loom-shaft speed of 150 r.p.m.

Another feature was two complete sets of standard drives, 1 to 5 h.p. and 5 to 10 h.p. These drives are designed to cover a wide range of horse-powers at various speed ratios and can be delivered immediately from stock. Several other interesting exhibits included a spinning-frame end drive as well as a complete range of chains.

English Electric Co., Ltd.

A good show of motors of various types and outputs depicted those generally used for electrically driving textile mills. Special attention was directed to a ½-h.p. motor with 86 per cent. efficiency which can be arranged for either belt, gear, or chain drive. The ventilation of the machines is on a positive system by definite air paths arranged so as to give each part its requisite amount of cooling, with a fan system incorporated. The loom motors were all of the totally-enclosed type with squirrel-cage rotors, designed for individual drive where

Fig. 6.—English Electric Co.'s Stand.

the starting torque should be sufficiently great to ensure quick acceleration of the loom from rest up to full speed. An effort was made to display reflectors, &c., to demonstrate the varying forms of lighting adapted to textile mills. The company has been doing a considerable amount of textile work recently, and amongst the completed contracts mention should be made of Coddington's at Blackburn and the Black Pits Mill at Rochdale. It has also recently installed two turbine sets and alternators at Maynard's Mill premises in Preston.

(To be continued.)

The Motor-Car Exhibition.

Comments and Suggestions.

The 19th International Motor Exhibition, organised by the Society of Motor Manufacturers and Traders, Ltd., in connection with the Royal Automobile Club, and housed at Olympia from October 8th to 17th, was the most important of the series, for there has been no Paris *Salon* this autumn, as in previous seasons, and looked at from the electrical point of view, interest was confined to the accessories, although the Magnetic Car Co., Ltd., had a 22/70-h.p., six-cylinder chassis on view which was provided with a "magnetic" transmission between the engine and the road wheels. No gears or clutch are needed, and the arrangement affords a large range of variable speeds; the engine is fitted with magneto ignition, but the electric lighting and starting are effected through the transmission system. In the components section such accessory equipment as electric lighting dynamos, lamps, horns, engine-starting devices, magnetos and coil ignition outfits, sparking plugs, &c., was displayed in abundance, but, except in the case of non-essential items, no really new apparatus was noticed. Mention should be made, however, of the "Heliroid" silent starter driving gear which was seen on the stand of Messrs. C. A. Vandervell & Co., Ltd.; the model is a compromise that was made to fit on a six-cylinder Belsize engine. It is arranged to be inserted between the dynamo and the timing gear case; therefore, the dynamo is driven through it with a magneto in tandem, which only necessitates one drive for the three units. One of the most suitable positions for this new drive would be off the lay shaft of the gear box. The design is extremely neat and compact, and the device should be quite silent in operation, as it eliminates the teeth on the flywheel and avoids shocks. Another item of recent design is an electric foot warmer for motor cars which consumes no more energy than one head lamp.

Accumulators are, of course, indispensable to the modern car, but no novelties were noticed, not even on the "Exide" stand; as was pointed out, however, at the re-union luncheon of the Chloride Electrical Storage Co., Ltd., the need for standardising battery crates and fittings has long been urgent, and the S.M.M. & T., recognising this, formed a committee to consider the matter, consisting of representatives of the leading battery makers. Agreement was finally reached, and it is hoped that car manufacturers will adopt the standards which battery makers will be ready to supply as from January 1st, 1926. Acceptance will enable them to fit any reputable make of battery without alteration to the cable connectors or space to be allocated for the battery by the chassis constructor. "Service" agents and battery repairers will also share in the advantages of standardisation, because their stocks of spare parts will be greatly reduced.

Mr. D. P. Dunn again invited serious attention to what he referred to as the short-sighted policy of the British car manufacturer in continuing the practice of purchasing his electrical equipment as a whole, instead of utilising the experience of specialist manufacturers and buying his lamps from a lamp maker, his starter-motor from a manufacturer of those articles, and his battery from a battery maker. The result would be, eventually, greater economy and, immediately, greater efficiency. An examination of the lists of 1926 cars shows that 88 per cent. of the British cars on the market follow the line of least resistance, and fit complete electrical equipment made by one manufacturer, whilst only 12 per cent. discriminate as to the various items and get each from specialists in that particular line. On foreign cars, notably American, the reverse is the case.

The result is that the average British car often has to be cranked by hand when cold, whereas on the average American car the starting handle is rarely, if ever, used. The generally-accepted reason for hand cranking is to spare the strain on the battery, but the battery is, for the most part, quite capable of doing its work, as is evidenced by the fact that the battery on the average American car is smaller, lighter, and cheaper, than that fitted on many British cars of much smaller horse-power.

After all, if the car buyer pays for an electric starter, he ought to get one that will start the car to which it is fitted, always and under all conditions; it is the starter which is the real bottle-neck, for the battery can only deliver as much current as the starter can utilise, and if the starter be underpowered a bigger battery will not provide the remedy.

On the stand of the British Thomson-Houston Co., Ltd., amongst magnetos, lighting generators, and ignition sets, an interesting form of automatic ignition-advancing mechanism was exhibited; it is designed to operate on the rotating shaft, and advances the ignition automatically in accordance with the speed, by actually advancing the rotation of the magneto shaft. In this manner the maximum sparking efficiency is maintained throughout a very wide range, and the timing may be governed in accordance with the requirements of any make of engine. It should be noted that, in addition to the action of this automatic feature, the ordinary hand-controlled timing lever is operative, and thus the range of advance and retard is further increased.

In the rubber tire section Pirelli, St. Helens, and Henley's products were on view, whilst the undermentioned firms also had stands on the gallery: A.C. Sphinx Sparking Plug Co., Ltd., Allen-Liversidge, Ltd., British Lighting & Ignition Co., Ltd., W. Canning & Co., Ltd., Delco-Remy & Hyatt, Ltd., Fuller's United Electric Works, Ltd., Hart Accumulator Co., Ltd., Klaxon, Ltd., Lodge Plugs, Ltd., Lucas Electrical Co., Ltd., Marelli Magnetos (England), Ltd., Midgley Car Lighting Co., Ltd., M.L. Magneto Syndicate, Ltd., North & Sons, Ltd., Peto & Radford, A. Picard, Powell & Hanmer, Ltd., Ripaults, Ltd., Robinhood Engineering Works, Ltd., Rotax (Motor Accessories), Ltd., Rotherham & Sons, Ltd., Scintilla, Ltd., and Simms Motor Units (1920), Ltd.

British motor cars have always been good, but with regard to price, ability to deliver in large numbers, and the equipment provided, there have been times when the position of the British manufacturer would not bear discussion. However, the position has changed, gradually, but surely; the demand for light cars is increasing on the Continent and in the Dominions, although in the medium-powered car market foreign rivalry is much keener, but there can be no doubt about which country leads in the production of the expensive high-powered motor car.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Rural Electricity Supply.

This subject seems to be a further step onwards towards clarification, judging from the information disclosed by the recent correspondence in your columns, coupled with the latter part of the article entitled "Electricity in Agriculture" which appeared on page 607 of the Electrical Review. Hence if some more of your readers would give of their experience, it would further help.

As regards wayleaves, it is not generally appreciated that a rental of one shilling for a ten-inch diameter pole, represents about £1,000 per acre; hence those landowners who are obtaining 2s., 4s., and 8s. per double pole (as stated in the above-mentioned article) are doing pretty well—to put the matter mildly—for the land would not be worth more than £25 per acre for agricultural purposes. In France they would get two-pence-halfpenny, and in Germany nothing, per pole. By the way, it is difficult to get more than one shilling per pole, even in towns, from the Post Office Telephone Department. This is a case where experience over a long period assists considerably.

It does not seem to occur to everyone that the presence of an electricity supply line adds to the value of the land, so the owner ought really to pay a premium to the enterprising erectors of the electrical installation. I recently came across a case—in Scotland, too—where the landowner bargained as a part of the wayleave which he granted that he should be supplied with electricity at one penny per unit. He does not, however, use the current because he thinks it is too dear! If only he had been educated as to what electricity would do for him, instead of being fed upon hypothetical arguments about costs per unit, the case might have been different. In France, the writer met a farmer who rejoiced because two 30,000-volt lines crossed his land at right angles. The reason was that he could plough all his land without erecting any lines of his own. For the electricity supply authorities were actually so pleased to sell lots of energy, that they did not mind hanging up three simple hooks on their lines, wherever the farmer wanted to work his electric plough. Truly the attitude to matters electrical differs greatly in different countries.

One would think that the majority of electricity supply undertakings in this country did not really want to sell electricity, or at any rate to go outside their existing customers. Lately I have had the opportunity of reading a number of letters from different central station engineers, explaining why they did not want to develop their business—one would hardly think that such letters could or would be written in this day and generation. It will be corroborated by anyone who is in close touch with the industry. What is evidently wanted is education—and then more education. There are, of course, many bright spots, *e.g.*, South Wales, Chester, Hackney, and others, but, alas, they are too few as yet.

Difficulties are made to be overcome, so I trust others of your readers will help in the solution of the problem, how best to reduce the cost of overhead construction in this country. It is no use slanging Electricity Commissioners or telephone engineers, but rather, as Mr. Fennell has done, draw attention to definite points that require modification or suggest how they can be countered, there being more ways of killing a cat than by hanging it.

R. Borlase Matthews.

Greater Felcourt, East Grinstead, *October* 17*th*, 1925.

Mr. Fennell's characteristic reply in your issue of October 16th to my letter in that of the 9th idem calls for a rejoinder.

It is generally recognised that it is only a big man who will readily acknowledge mistakes, and I was hoping that Mr. Fennell would do what was right and admit that he had overstepped the mark when he accused engineers in another public service of devising excuses to save themselves trouble in carrying out work, the actual sentence to which I took exception being: "Their talk of efficiency limits is a device to save themselves trouble." I confined myself entirely to that point in my letter, and showed that in quite 75 per cent. of the crossings of high- and extra-high-pressure circuits the Post Office placed its lines underground. Mr. Fennell himself agrees that in a recent case the Post Office offered to put its lines underground at 23 points, and the fact that they were local circuits and not junction circuits has no bearing, as there is as much "trouble" in placing one type of circuit underground as the other. The Post Office official who has the work to do in these cases, is the Sectional Engineer whose merits Mr. Fennell now extols.

As stated in my last communication, when projected high- and extra-high-pressure overhead lines will cross P.O. overhead lines, first consideration is given as to whether the P.O. lines can be placed underground without undue degradation. This, in effect, means that all subscribers' circuits are so dealt with, the doubtful cases being junction circuits and short trunk circuits. The junction circuits are of great importance, and to refer to them as "paltry interconnecting circuits" shows a want of appreciation of the telephone system layout. "Paltry" is defined as "worthless, petty, contemptible," and is quite a wrong adjective to associate with these important links in the chain of telephone communication.

On the other hand, I am afraid Mr. Fennell has been misinformed if he was told that the Post Office rule is to refuse to put underground any but subscribers' connections. This is not correct. The transmission efficiency of each junction circuit concerned in a crossing is considered in every case and if the circumstances are favourable, an offer is made to the power undertaker to place the route underground. The placing of junction circuits underground is not uncommon. I do not think it necessary to supply actual details of cases, and Mr. Fennell must accept my word as to the procedure and the results.

I am not quite clear as to the positions of the "higher officials" in Mr. Fenell's letter. One of his sentences might be read to include me in that galaxy, and I had a correspondingly thrill when I read it. Whoever is intended, however, I can assure him that only engineers deal with the question whether a line shall or shall not be placed underground at a power crossing, and they are to blame if blame there be.

As regards the technical aspects of telephone transmission by overhead and underground lines, Mr. Fennell can find this explained in "Telephone Transmission," by J. G. Hill, published by Longmans, and the application in Post Office Technical Instruction No. XXI, which can be purchased from H.M. Stationery Office.

I do not wish to pursue this correspondence. I only entered upon it to protest against a flagrant reflection on colleagues, and incidentally myself. I should like to say in conclusion that the St. George and Dragon attitude is quite out of place. Anyone reading some of the statements commonly made would imagine that the Post Office was deliberately engaged in thwarting the efforts of the Electricity Supply Authorities from malice prepense. I think those best able to judge, and possessing a sense of proportion, will not agree with these extravagant criticisms. Differences of opinion on technical matters are understandable, but they can surely be expressed in measured language.

S. C. Bartholomew.

G.P.O., London, *October* 17*th*, 1925.

With reference to your leading article in this week's Review on the above, is not the whole industry suffering from rules and regulations?

In quite recent years the arbitrary rules of 1,000 amps. to the square inch was absolutely compulsory; although we knew that an 18's wire would carry 10 amps. we were not allowed to let it carry more than 1.8 amps., and we have had to replace an 18's wire with 3/20's when the load was 2½ amps.

Here in Manchester in the early days the contractor's life was made a burden by the utter absurdity of the whole book of rules; every single item comprising an installation had to be approved by the chief, who kept a museum, and if the ceiling rose or switch, &c., did not appeal to him, there was no alternative but to scrap it and install other approved patterns.

In later years, this gentleman, we believe, was one of those responsible for the present I.E.E. Rules, when if a lampholder is within reach of a stone floor, it must be shrouded in an ugly black covering, while the switch must be all porcelain, which is mechanically weak and a constant source of trouble and expense to the user.

We have fixed many thousands of ordinary tumbler brass covered switches which are still in operation, and so far as we know, no one has been killed by a shock received from one of them, and flush switches rarely have the cover plates earthed.

Then there is the everlasting question of "earthing." If a radiator should be earthed, why not an iron or a vacuum cleaner? and how must an iron be earthed? We have sold many thousands of plug adaptors to fit an ordinary lamp holder, and we should imagine that a good proportion are used in a kitchen with a stone floor—but we have yet to hear of a fatality through an electric iron.

On the other hand, most of the much-advertised cleaners are not only not earthed, but they are used in ninety-nine cases out of a hundred on a power plug which is fused to blow at 20/25 amps., and this on a piece of apparatus which has a cord subject to rapid wear and which only requires, at the most, 200 watts. Yet this goes on year in, year out, all hopelessly wrong, yet we never hear of a fatality through using domestic apparatus.

If figures could be obtained showing the numbers of deaths from electric shocks and from gas poisoning or explosion, the proportion would be found to be all in favour of electricity yet so far as we know, there are no restrictions on how gas must be installed. The gasfitter does not have a fifty-page book of rules, yet he is dealing with a far more deadly thing than the electrician, and if he installs a gas radiator, he uses an ordinary gas tap, whereas the electrician has to use a plug which makes a very big hole in a pound before the wiring is started, making a costly job of an electric heating installation.

We have hundreds of the old 2-pin heating plugs on our jobs which up to now have not, to our knowledge, caused any serious accident.

With electricity coming on as it is now, it is our duty to make its installation as simple a matter as possible, instead of hedging it round with restrictions—a lot of which are totally unnecessary.

The following is an example of how awkward a supply authority actually can be:—

We applied for a supply for an hotel to replace a small plant in Cheadle, and told them the average maximum demand was 1 kW and that this would total 2 kW when we had their supply.

The supply people would not take this and flatly refused to consider our application until we had told them the candle-power of every lamp installed—the joke being that nearly every lamp was changed to twice its candle-power when the supply was installed.

Again, nearly every supply authority has different rules and regulations, and what will pass in Manchester will not pass at, say, St. Annes, Liverpool, &c.

The plumber is in a very much happier position than the contractor; he is registered, the public cannot get discounts off plumbers' material, he is not up against the insane competition of the wireman doing odd jobs in his spare time from a private house—possibly with material he has stolen from his employer.

But we suppose all this is due to electricity being still in its infancy (*sic*)!

E. O. Walker.

Manchester, *October 14th*, 1925.

Mr. W. Fennell's excellent letter in your issue of September 25th will no doubt be readily endorsed by all engineers who have the problems of supplying large rural areas, and erecting overhead transmission lines, before them, although with regard to the "Post Office" his remarks seem a bit too strong. While appreciating the annoyance caused by the strict enforcement of out-of-date regulations, one must also admit that, on the whole, the Post Office engineers will stretch a point in order to meet the supply engineer's requirements, and I am only too glad to state that this has been my experience on many occasions. Of course, the supply company when second comers must pay for any alterations, &c., to the Post Office plant that their lines necessitate, but it does seem unfair that where the Post Office are second comers, and guarding, &c., becomes necessary, they will only agree to "consider as a concession" bearing half the cost thereof.

As far as low-pressure lines are concerned, the use of "P.B.J." cable by either party will overcome most difficulties to-day.

Another point which I have not yet noticed raised in your columns is the very widespread prejudice against overhead lines that one is constantly up against from local authorities and residents in the country generally. They are "dangerous," "unsightly," "spoil the amenities," and so on, and of course opposition of this sort is frequently fostered by the local gas company. Much delay and expense is often involved in overcoming it, and one can only liken it to the short-sighted prejudice and obstruction experienced by the railway companies nearly a century ago. The clauses of the Acts which are eagerly seized upon for this kind of opposition need re-drafting, and as has been already suggested in your columns, suggestions for the revision of existing regulations should be made to the Electricity Commissioners.

How differently these things appear to be done in other countries! Areas in Belgium which were utterly desolate a few short years ago are to-day entirely rebuilt and cultivated, and everywhere, stalking across the country, one sees the concrete poles and overhead lines connecting up villages, the names of which are burned for ever in our memories. Even in Ypres, with its brand new and ugly buildings, the supply is carried down many streets on brackets fixed to the fronts of the houses. The mere suggestion of this over here would almost cause a riot as things are at present. However, from the publicity you are now giving the matter, let us hope that easier conditions will soon prevail.

A. Adrian Hunt.
The Hayward's Heath & District Electric Supply Company, Ltd., and The Burgess Hill & District Electric Supply Company, Ltd.

Burgess Hill, *October 13th*, 1925.

A More Comprehensive Wireless Exhibition.

I shall be glad of an opportunity of inviting the attention of your readers interested in radio to the following points:—

During the last three years the National Association of Radio Manufacturers has organised a "Wireless Exhibition," and whilst this has been thoroughly well arranged, there can be no doubt that it would be more appropriate to call the outcome of its efforts an "Exhibition of Popular Wireless Receivers and Accessories," since the apparatus shown is restricted to the kind which is of interest solely to those known, for want of a better name, as "Broadcast Listeners."

Exhibitions of the kind referred to, do, of course, provide an opportunity for any manufacturer to see the products of certain competitors, but on the other hand, the constitution of the organisers precludes many other manufacturers from exhibiting, and therefore the exhibition cannot be regarded as completely representative, even of British manufacturers of broadcast receivers.

I would like to suggest to all parties concerned that it might be advantageous on some future occasion to organise a true "Wireless Exhibition," open not only to manufacturers of receiving sets and accessories, but what is equally important, to the manufacturers of the plant and instruments required on the engineering or transmitting side of radio-telephony and telegraphy.

It is generally admitted that the technical quality of radio-telephony broadcast in this country is of a very high order, in consequence of which manufacturers of transmitting, as well as receiving, apparatus have received many inquiries from abroad, from which fact we can assume with reasonable safety that an exhibition covering every application of wireless-telephony and telegraphy, both from the transmitting and the receiving side, would attract the attention, not only of the public and the manufacturers, but also of prospective buyers from abroad.

An exhibition on these lines, therefore, would be certain of success and might confer great advantages on this branch of the British engineering industry.

Incidentally, such an exhibition might help everyone concerned to realise that the prosperity and employment resulting from the extensive sale of receivers, accessories, and journals depends in the ultimate sense on the engineers who design the transmitting equipment, and when the complexity of the radio engineers' work is appreciated, it will be seen that these men need the widest possible training and experience.

L. F. Fogarty.

Ruislip, *October 14th*, 1925.

Is the Contracting Business Degenerating?

"Polyphase," in his letter of the 3rd inst., propounds rather a difficult problem for those ignorant of the local circumstances. Assuming rigid specifications, the possible solutions are:—

1. The plumbers who beat his price may have gambled on getting both electrical and plumbing work on this installation, and by co-operation in both branches foresaw a certain time economy, to be achieved in "lifting and laying" work, &c.
2. The work was in an outlying district. The plumbers may have calculated on employing a man (or men) resident near the installation without paying country allowance and/or travelling expenses, or their business may have been situated more advantageously to the site of the work than was that of "Polyphase." This would have a considerable bearing on the wages charge, which appears abnormally high (see 3).
3. These following assumptions are based on the information given by "Polyphase."
   Saving effected by *cheap* material—selling price £8
   Assume prime cost saving to be £7
   Therefore *total* cost of *quality* material equals, say £21, which, with total prime cost of whole job at £80, using quality material, leaves a prime wage charge of £59.
   The wage charge on contracting work is one on which the greatest variation will occur, provided the material specification is fairly "watertight." Even with all other things equal, a discrepancy of 33⅓ per cent. is by no means unusual, and in this case would assist to explain the difference in estimated prices. If the prime cost of materials is much greater than I have shown, I would assume a greater prime cost saving than £7 by the inclusion of Continental and other rubbish.

Of course, there are 15 other possible solutions to this question, any one or all of which may be duly unearthed by the Official Receiver, or gentlemen of that ilk.

Q. O. C. H.

October 12th, 1925.

I agree with "Polyphase" that the contracting business is degenerating, and will continue to, until some sort of elementary examination is at least made by employers to find out whether they are employing men with some little electrical knowledge.

At the present time all one need have is a full benefit trade union card to command full union rate, irrespective of one's abilities, or knowledge.

Ninety per cent. of men holding such cards could not pass a first-year wireman's examination of the City and Guilds, and a great number do not even know Ohm's Law. Until we have some system of examination for wiremen as in New Zealand and Canada, and supply companies and fire insurance offices refuse to pass work not up to I.E.E. standards, the business seems hopeless. Take, for instance, the work being passed at the present time on many of the electric signs. Would some of the contractors care for, say, an inspection to be made of the work by a consulting electrical engineer?

Contractor.

October 19th, 1925.

We feel it incumbent upon us to reply to the blatant comments on the above question appearing in your columns, above the *nom-de-plume* "Hard Working Ex-Service Electrical Contractor."

First, when his business expands (as we think it must do, bearing in mind the figure quoted per point), he will probably discover that his "evenings" on the books will, of necessity, have to be extended into the small hours of the morning.

So he engages a clerk, and *then* an extra electrician or so (to cope with all the contracts he cannot do himself), and presently finds that after he has interviewed prospective customers and travellers, measured one or two jobs up and prepared the estimates therefor, and trotted round at the week-ends to collect a "few" cheques and promises, he wants a portable electrical installation, to "see" to earn his 25s. per day. So it goes on, until he degenerates, from a "producer" to a "non-producer"; and a very hard-working one at that. About this time, he makes the astounding discovery that he is no longer able to execute work at 10s. 6d. per point, and make a profit. But (and here's the rub) a new "spark" arises in the elec-

trical firmament (10s. 6d. per point and fully guaranteed), and when it transpires that it is the man he sacked last week, "Hard Working Ex-Service Electrical Contractor" gasps; possibly puts all his small change in the "swear box," rushes into print, and joins the ranks of "Polyphase" and——

Another Hard Working Ex-Service Electrical Contractor.

Birmingham, *October 16th*, 1925.

The above question has apparently nettled your correspondent, the reason being obvious, as he gives it himself. "H.W.E.S.C." is one of the type of individuals who are lowering the status of the electrical contracting business. If I am endeavouring to uphold the status I cannot be deteriorating. Your correspondent's letter contains foolish assumptions and sarcasm and it would make comical reading were it not so pathetically stupid. I have no desire to write a page of my history, but for your ultra-clever correspondent's information I would inform him that I have had 20 years' experience as an electrical engineer (not a wireman), 14 of those years having been spent in hard work (on the tools). My present business is conducted from an office (not a dwelling house), no showroom, little girl keeping books and office, writer on the road from 7.30 a.m. till 8 or 9 p.m. I am indeed sorry that there are individuals like "Hard Working Ex-Service Contractor" (if he is a contractor).

Polyphase.

October 17th, 1925.

The letter on "Electric Wiring" in this week's issue, signed by "Polyphase," touches a matter that has long been—may I say?—a cloud upon the "electrical horizon."

We are periodically treated to outbursts upon "popularising electricity" by various bodies, but nothing much appears to be done about that abomination, the "jerry-wireman."

Admittedly it is a bit of a problem, but I certainly think it time that steps were taken to see that only competent men undertook the work of wiring. May I here make the suggestion that—dare I breathe it?—the Institution of Electrical Engineers might make a start by holding, periodically, examinations on electrical wiring; and included in this examination should be a test of the candidate's knowledge of the I.E.E. wiring rules. A certificate should be issued to the successful candidates, and one might hope that, in the course of time, no one, without this qualification would be allowed to practice wiring.

When I say examination, I don't mean a highly technical examination, such as the Institution conducts at present, but a simplified one, that would test a candidate's fitness for the "job of wiring."

I fully realise that the wireman is not always to blame; a help in this direction would be weekly wages and an annual holiday—for if the manager needs a holiday, so does the man whose duty it is to keep the station clean; do we not *all* need a change now and again?

We have an excellent set of rules for our guidance, anent wiring, but I wonder how many undertakings can legally enforce these?

Under the circumstances what better body than the Institution of Electrical Engineers could conduct an examination for "proficiency in wiring"?

I think I am correct when I say that the British Horological Institute issues "Repairers' Certificates" to watch and clock repairers who pass its examination; and I also believe that it conducts classes for preparing candidates for this examination. I may be asked: What has this to do with electric wiring?

I have only cited the above with a view to showing that what one institution can do, another can.

I certainly think that something should be done; for the ignorance of some so-called wiremen anent matters electrical is startling.

Ghost.

October 17th, 1925.

The Manufacture of Alternating-current Motors.

In his letter published in your issue of October 9th, Mr. Shaw declines our invitation to arrange a meeting so that we could supply him with the facts he asked for, and in addition he proceeds to introduce irrelevant topics.

We can only conclude that Mr. Shaw was not serious in expressing a doubt as to the accuracy of our statement, but that this correspondence was started for another purpose altogether. We must, therefore, decline to continue the correspondence.

We believe that the Crypto Electrical Company, Ltd., manufactures chiefly small-size machines. Our statement refers specifically to a.c. industrial power motors, and this term is generally understood to mean motors ranging from 1 to 250 b.h.p. Fractional h.p. and small special machines are obviously outside the class of machine referred to by us, therefore Mr. Shaw's reference in his letter to his company's *sales* for July is entirely beside the point. We also specifically mentioned output not sales, because monthly sales fluctuate between wide limits, whereas output represents productive capacity and is much more steady and reliable as a basis for comparison. Our July sales figure would surprise Mr. Shaw, but this is so obviously an unfair basis for comparison that we would not quote such a figure.

Mr. Shaw rather unkindly suggests that our information regarding competitors' output has been obtained surreptitiously. It is probably true in respect of the smaller manufacturers that they do not exchange such confidences, and Mr. Shaw will, therefore, no doubt be surprised to know that more than one large manufacturer of a.c. motors in this country has been pleased to exchange with us, in confidence, output figures. If Mr. Shaw cannot comprehend that facts supplied to us in this way cannot be published we are unable to help him. We know our announcement to be true and probably in time Mr. Shaw will realise this fact.

In conclusion, may we add that we are in agreement with a recent correspondent in your columns respecting a series of advertisements of a company of which Mr. Shaw is a director. That correspondence emphasised the fact that engineering products do not lend themselves to the same treatment from a publicity point of view as patent medicines.

Electrical Manufacturing in Russia.

WITH the opening of the new financial year in Soviet Russia particular attention was devoted, in all branches of the State monopolised industries, to the programmes which have been prepared for developments in 1925-26, and even in the next five years, for which plans have in some cases been drawn up.

In these deliberations the electrical manufacturing industry, as well as the supply branch, has occupied a prominent position. Judging from the information available from Soviet sources, and recorded from time to time in the columns of this journal, and from the fact that orders are known to have been placed for electrical machinery and plant both in this and other countries during the past two years or so, it is certain that progress is being made in the supply industry and in the manufacturing branches, even if many statements emanating from Soviet circles have to be accepted with some reserve.

The Board of Trade recently issued a report from the British Commercial Mission in Moscow giving a survey of the coal mining industry in Soviet Russia, which has been accepted as an authoritative document. Yet the only information available to the British Mission, as well as to the other trading missions in Russia, is that which is furnished by the Soviet Government and published in the official newspapers, and from this point of view the commercial missions in Russia could just as well fulfil their duties in London and other European cities in this respect, without the large expenditure necessary for the maintenance of these organisations abroad, and that, too, with a greater measure of personal convenience and comfort. Little information or statistics can be obtained from private sources, and the convictions and punishments occasionally meted out to Russians found guilty of what is termed "commercial espionage," as, for instance, those which recently took place at Kharkoff in the matter of the coal and iron and steel industries, are sufficient to prevent any repetition of these cases which, after all, only amounted to the giving to former foreign owners of a little information, in return for the payment of a few roubles, respecting the condition of mines and iron works.

Though little information is, as we say, available from Russian sources, British electrical concerns which are finding ways of doing business with Russia have first-hand proofs of the electrical progress that is actually taking place. The Metropolitan-Vickers Co. and associated concerns have long been in actual touch with the market, as our pages have shown, and it was Sir Philip Nash who, eighteen months ago, advocated an extended and particular application of Export Trade Facilities Act accommodation for concerns which found the risks too heavy to carry unsupported. It was with great pleasure that we reported in our last issue that Captain R. S. Hilton, of the same company, referred to a recent visit that he had paid to Russia (six weeks previously, as a matter of fact) when he discovered, to his astonishment notwithstanding all that has been reported in these pages, that they were developing their sources of electricity supply in a most wonderful manner.

The Russian electrical industry is confronted with three distinct problems. In the first place, the Central Electrical Trust and the Leningrad Electrical Machine Trust, which, as mentioned previously, were to be consolidated, have now actually been amalgamated as from October 1st under the title of the Get or State Electrical Trust. In this connection Mr. H. N. Milshtein, one of the directors of the enlarged trust, is reported to have stated at the beginning of this month that the union of the two heavy electrical engineering trusts coincided with the time of increasing the load on the works embodied in this trust to the limits of their technical possibility. The second problem relates to the proposed great extension of the manufacturing industry, and the third concerns the utilisation of foreign experience in the promotion of the scheme of expansion. Mention has previously been made of the intention of Russian electrical engineers to seek the aid of foreign works, and in this respect they have already availed themselves, to some extent, of the services of Swedish firms.

Apparently the turn of the Germans has now arrived, as was briefly mentioned in our "Business Notices" a fortnight ago. According to statements emanating from Berlin, negotiations have been proceeding for some weeks past between representatives of the Russian electrical trust and the Berlin A.E.G., and these are said to have resulted in the reaching of an agreement in principle. Under the agreement—which seems to resemble those between the German company and the General Electric Co. of New York of the pre-war period, renewed in the post-war period—it is proposed to place at the disposition of the Russian trust the technical experience and patents of the A.E.G., and it is said that the General Electric Co. of New York will probably participate in the arrangement. The Russians also intend to enter into an agreement with the International Glow Lamp Trust, for which negotiations are now proceeding. Besides the technical agreement, the Russians desire to conclude one in regard to the deliveries of machinery by the Germans of the value of £2,000,000, but some difficulty is being experienced in the matter owing to a credit of several years being asked for by the Soviet interests. It is stated that in A.E.G. circles confirmation is forthcoming of the conclusion of the technical agreement, although the signatures of the representatives of the Russian Government have yet to be appended to the documents.

Coming now to the electrical engineering industry, which has been investigated by the electrotechnical section of the special conference in Moscow, the section has made it quite clear that the absorbing capacity of the market in the next five years will grow to four times the pre-war capacity. At the end of that period the home production is expected to be covered to the measure of 80 per cent., so that it will be necessary to increase the producing capability of the works from the rate of 100,000,000 roubles, which was the annual rate on July 1st, 1925, to 320,000,000 roubles (£32,000,000) per annum in 1930. The only manner in which this development can take place is by the construction of new works and the undertaking of bulk production, especially of machines. In view of this fact, a beginning has already been made by the extension of the "Dynamo" works, which is specialising in tramway and crane motors. At Kharkoff the former Gerlyach Pulst Works is being united with the former Vek Works, and the construction of standard machines will be organised there, while at the same time the foundry is to be enlarged and all the extensions finished in two years. The production of transformers is to be concentrated at the Provodnik Works in Moscow, and the output from other works will be discontinued.

A big programme of construction is to be carried out in the low-pressure industry in Leningrad and Moscow in 1925-26. Besides these, almost all the other producing works will be considerably extended as, for instance, the Electric Carbon Works, which will then also turn out carbon brushes, and the Svetlana lamp factory. In 1926-27 the second stage is intended to be embarked upon, when works will be established in Leningrad for the production of materials, works for the manufacture of high-pressure insulators in Moscow in substitution for the old Isolator Works, and a factory for the manufacture of carbon electrodes. The capital expenditure on the extensions contemplated in 1925-26 will have the effect of increasing the productive capacity of the works under the control of the General Electric Commission from 86,000,000 roubles to 141,000,000 roubles per annum. The capital outlay proposed in 1925-26 amounts to 21,600,000 roubles.

Of course, the execution of the programme for the year depends upon whether the money required is or is not placed at the disposal of the industry.

The I.E.E. Presidential Address.

The address with which Mr. R. A. Chattock read himself into the presidential chair at the meeting of the Institution of Electrical Engineers last week was one of the shortest that we have heard, and one of the most spirited. As he has plainly shown during the past twelve months, he has no liking for the proposals which, it is believed, are to be brought forward by the Government next month, and he took the opportunity offered by his inaugural address to give reasons for the opinions which he holds. The principal items in his speech were the advantages of pulverised fuel, the necessity of improving the load factor on electricity supply undertakings, the interconnection of power stations, the standardisation of frequency, and the training of electrical engineers. On almost all of these points we are glad to find ourselves in full agreement with Mr. Chattock.

Almost exactly a year ago, commenting on a proposal of Mr. J. H. Ellis, chairman of the Plymouth Gas Co., that electricity works should go hand-in-hand with gas works, with the conservation of coal as their common aim, we pointed out that the increasing use of pulverised fuel was a long step in that direction, and that the solution of the problem might involve the carbonisation of coal at a lower temperature than was customary. A similar proposal by a gas engineer, Mr. R. Gray, of Hamilton, is reported elsewhere in this issue. On various occasions we have returned to this subject, and it is interesting to find that Mr. Chattock, who has adopted pulverised fuel for recent boiler extensions, is emphatically in favour of its use on the grounds of economy in capital cost and operation, and of the possibility it presents of utilising the refuse heaps of collieries; like Mr. W. B. Woodhouse, in his presidential address last year, he has given serious attention to the question of coal distillation and by-product recovery, and whilst he repeats his predecessor's warning regarding the market price of by-products, he is attracted by the system of carbonisation of pulverised coal, yielding fuel in powdered form ready for combustion in boiler furnaces, which we recently described—subject to its proving satisfactory.

With regard to load factor, Mr. Chattock points out the necessity, which we have frequently emphasised, of improving the load factor by the adoption of a two-part tariff to encourage domestic uses, by railway electrification, and by securing other long-hour loads. But he agrees with our contention that no improvement in

load factor is likely to result from the interconnection of distant power stations, which usually possess load curves of similar configuration, and he cites American experience in support of this view.

The subject of interconnection Mr. Chattock treats as inseparable from that of standardisation of frequency, which is an almost indispensable preliminary condition, and, we take it, would not be pressed if the question of interconnection did not arise. Mr. Woodhouse last year pointed out the disadvantages of interconnecting distant stations; Mr. Chattock goes further, reminding his audience that local generating stations are now highly economical, and to derive any large proportion of the supply from a distant station would entail heavy capital cost without increased economy. As we have previously pointed out, the concentration of plant involves increased outlay and loss of energy in mains, and where the load curves are similar, the interconnecting mains merely take the place of stand-by plant, which can be more economically provided where it is wanted. Moreover, it is impracticable to tap such mains without the use of very costly switchgear and regulating apparatus; an interconnecting main is a feeder, and cannot at the same time be a bus-bar. These facts were emphasised by Mr. Chattock. The interlinking of adjoining stations is a different matter; as we have stated, it involves no great outlay, whilst its advantages are unquestionable, and Mr. Chattock fully approves of this.

With regard to the standardisation of frequency, we have propounded the view that this would be desirable, though not essential except for the purpose of interconnection; it would reduce the cost of a.c. apparatus, and do away with the flicker that occurs in lamps fed from a 25-cycle supply. Mr. Chattock may well be excused for minimising the importance of these questions, in view of the fact that the huge Birmingham undertaking is mainly dependent on a 25-cycle system, and that to convert it to 50 cycles would involve an immense upheaval; and he gives figures indicating that the cost for Birmingham alone would be nearly seven millions sterling, and for the whole country the colossal figure of 27 millions. Whilst we adhere to the opinion that a uniform frequency of 50 cycles for public supply would be decidedly advantageous, we feel that if his estimates are correct the outlay is out of all proportion to the benefits that would accrue from it.

Finally, we welcome Mr. Chattock's comments on the training of electrical engineers, which are in close accord with the advice that we have given from time to time to the many parents who appeal to us for guidance.

The British Industries Fair.

Manufacturers may perhaps be pardoned if they complain that they have had more than their fill of exhibitions, for it must be admitted that this somewhat expensive form of publicity has been heavily run on during the past year or two. There are many reasons why firms of a certain standing must often participate in these displays, but it is certainly a fact that results are not always satisfactory, although it is practically impossible to make an accurate appraisal of the results of an exhibition, some of them being of a very indirect nature.

We would, however, once again draw our readers' notice to an exhibition which is very different from the majority, namely, the British Industries Fair. As the principal aim of this Fair, which is of an official character, is to bring large buyers into direct contact with manufacturers, the results are more tangible, although it also brings in its train orders which cannot definitely be linked up with it. It may be said that practically every visitor to the Fair is a potential buyer; whereas at an ordinary exhibition mere sightseers are in the majority, often to the detriment of business.

There is no doubt that this is realised by many important firms which are to be seen year by year at their stands in the Castle Bromwich Aerodrome, Birmingham, or the White City, London. It may be taken as certain that these firms do not take space so regularly from pure altruism. They evidently derive some advantage from their participation, and this would appear to indicate that other firms stand a good chance of securing business in the same way.

Hitherto the electrical manufacturing industry has not been represented at Birmingham upon the scale which its importance justifies. The Fair has given an opportunity to many of the local firms to display their wares, and upon the whole these firms have seized it in a commendable manner—no doubt with corresponding benefit to their business. But while expressing our appreciation of the efforts of these firms, we feel bound to say that the electrical industry of this country should be more thoroughly represented at the Fair, and we urge manufacturers to study the matter and, if possible, to take a hand in this important means of fostering our export trade.

In any consideration the encouragement given by the Government should be borne in mind. A sum of £25,000 is being utilised for the sole purpose of propaganda for the Fair, and 75 per cent. of this will be spent on advertising the Fair abroad. Potential buyers from overseas are aided in a number of ways—another excellent feature of the organisation—and the whole of the commercial, diplomatic and consular service assists to make the Fair and its objects known in all parts of the world.

It is satisfactory to learn that applications for space are being received at a rapid rate; we advise British electrical manufacturers to apply in good time.

The Society of Technical Engineers.

The formation of a Staff Benefit Society under the ægis of the Engineering and Allied Employers' National Federation has had an unfortunate result as regards the "Third Party in industry." It appears that the rules of the new Society include a condition that none of its members shall belong to any professional protective association, which would, of course, exclude the members of the Society of Technical Engineers from participation, and a protest addressed by the secretary of the S.T.E. to the Federation, pointing out that this provision was in effect an official ban on membership of his Society, met with a cold reception. Consequently the Executive Council of the S.T.E., on Saturday last, unanimously adopted the resolution which is recorded amongst our "Notes" to-day (p. 708). A second resolution was adopted as a rejoinder to an attack made by the Trade Union Congress last month upon the "Third Party" movement.

It is true that staff organisations exist which have joined hands with the manual trade unions, but this does not apply to the Society of Technical Engineers, which has explicitly forsworn the use of the strike as a weapon, has kept outside the Labour movement, and has pledged itself always to promote the interests of industry in general—"to seek peace and ensue it." This policy apparently appeals neither to the employers nor to the Trade Unions, doubtless on the principle that he who is not for us is against us; the S.T.E. refuses to ally itself with either side, and consequently both sides regard it askance.

We believe, however, that they are both mistaken, and that the Society of Technical Engineers will prove to be sincere in its desire to work for peace in industry. Occupying, as its members undoubtedly do, an intermediate position between the employers and the manual workers, they are admirably situated to mediate between them, to convey to each a lucid and impartial presentation of the other's case, and in some measure to mitigate the disadvantages suffered by the engineering industries through the want of a Whitley scheme—all this, of course, apart from the services rendered by the Society to its own members. We sincerely hope that the Engineering Employers' Federation will not assume a hostile attitude towards the S.T.E., which would not only be, we think, unjust, but also ill-advised.

Electrical Developments in Finland.

The Inimitable Imatra.

By THEODORE STEVENS, M.I.E.E.

"The most beautiful waterfall in Europe" is in the hands of the engineer, but lovers of Nature's beauties are not to be deprived of their enjoyment of Imatra for

Fig. 1.—The Rapids of Imatra, Half a Mile in Length.

many years, because the volume of water is so great that the whole plant that is to be installed (construction will occupy two years more) could be run at full load

Fig. 2.—The Wallinkoski Rapids.

during minimum flow with a surplus in the narrow river bed of two hundred tons per second. The drainage area is 23,000 square miles, and the run-off, equivalent in a

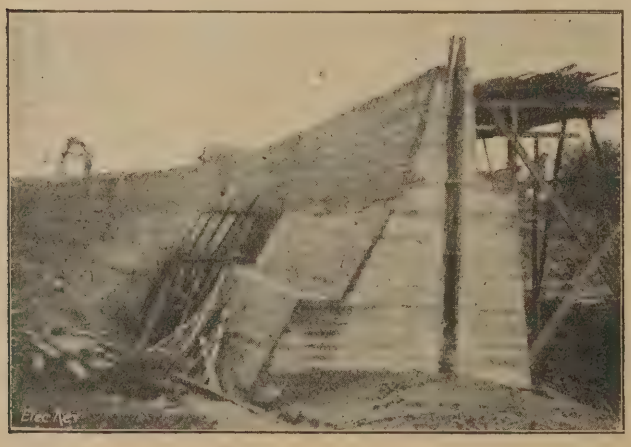

Fig. 3.—Incomplete West Wall of Head-race.

year to less than 12 inches of rainfall, does not vary more than 20 per cent. from the average of 20,000 cubic feet per second.

The River Wuoksi has ten consecutive rapids between Lake Saima and Lake Ladoga. Of three relatively small water-powers in existence, two will disappear when the level of the head-race water is raised.

If the time ever arrives when the whole flow is diverted from Imatra rapids, Wallinkoski, the next rapids south of Imatra, will be "the most beautiful in Europe."

To appreciate the reason for this moderate interference with scenic beauty, which Finlanders and everyone who visits it appreciate, the power situation throughout the country must be examined. In Finland there are hundreds of small water-power plants (30,000 h.p. total

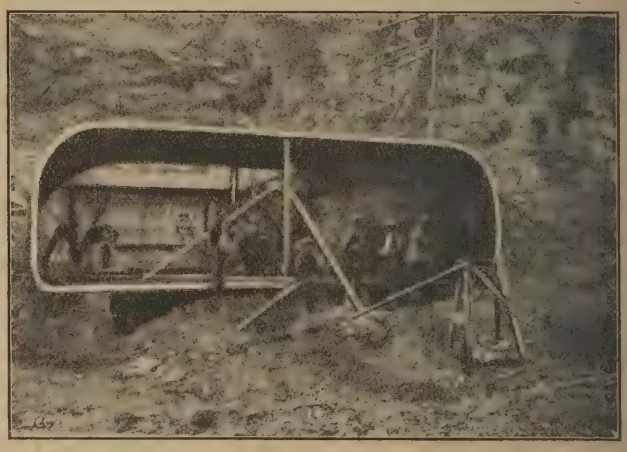

Fig. 4.—Discharge Outlet of First Set in place, Aug. 21st, 1925.

of less than 50 h.p. each), and 200,000 horse-power total in 165 plants, of over 50 h.p. and up to 16,000 kVA. In addition, there is a quarter million horse-power in various types of heat engines.

Many networks of transmission lines at voltages up to 70,000 V connect some of these 165 plants into groups, one having twelve plants interconnected. A careful examination of a large-scale map of these transmissions,

Fig. 5.—Excavation for Tail-race.

totalling 4,600 miles, reveals no point on any network more distant than 26 miles from a generating station.

A quarter of the area of Finland is comprised in four districts (*viz.*, Viborg, Nyland, Abo, and Tavastehus), where 60 per cent. of the total population live and where 90 (of the 165) plants are situated. From Imatra in the east to Abo on the west coast power from Imatra will be transmitted 240 miles at 110,000/120,000 volts and suitably interconnected with most of the existing networks in those four districts, supplementing their power. When this is complete, no plant on the network will be more than 30 miles from a generating station.

Finland's area is nearly 150,000 sq. miles; of this 17,000 sq. miles is covered by inland waters; 100,000 sq. miles by forests; 7,200 sq. miles are arable land (1910 census); and 3,700 sq. miles are under pasture. The population is nearly 3,500,000, and 224 kelvins are consumed per annum per head of population. Nearly

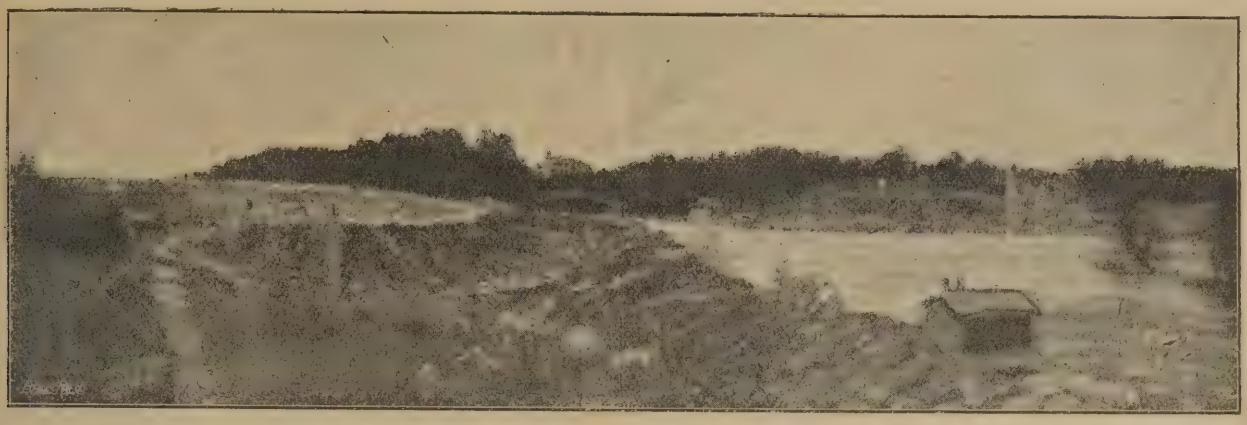

Fig. 6.—Wuoksi River at Normal Level; Head-race on Left, Showing Raised Level.

3,000 miles of railway and 20,000 miles of high road provide means of transport.

For comparison, the British Isles, with fourteen times the population on 81 per cent. of the (Finland's) area, consume 66 per cent. of the kelvins per annum per head that Finland consumes.

The Government decided in 1921 to develop part of the power of the Imatra rapids and to interconnect the new station with existing stations in the south of Finland. The diversion works at Imatra are straight in plan, nearly 300 ft. wide and 2,400 ft. long; 80 ft. head will be utilised. 800,000 cubic yards of earth and 300,000 cubic yards of rock must be moved. The works are estimated to cost £10 per installed horse-power at the present extraordinary rate of exchange of 193 marks to £1 (25 was the normal value). Sluice gate works are under construction, and when these are completed the river water will be passed through them whilst revolving gates are built over the present river bed. The power-house site is visible in fig. 5, and fig. 4 shows the outlet end of the first 27,000-h.p. set in its final position. Three sets of this size will be installed by 1928. The ultimate capacity of the site, which lends itself to storage, is about 250,000 h.p.

The existing low-head water-power plant at Linnankoski (fig. 7) will be submerged when the Imatra plant is completed, since it stands below the contemplated level in the new head race.

The following works of reference may be useful to the interested reader:—

Electro-Farming.

Intensive Illumination on a Market Garden.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

Artificial lighting has been employed to hasten the growth of plants by different experimenters at intervals from the year 1775. At the Paris Exhibition of 1900 the writer had the opportunity of inspecting the effects of electric lighting on plants through glass of various colours and again in 1906 he was privileged to observe the experiments at Schenectady carried out by the late Dr. Steinmetz with mercury-vapour lamps. Until the last few years all work in connection with the artificial illumination of plants has been carried out with light of ordinary intensity. However, during the latter period, a considerable amount of research has been conducted in America with very intense illumination; in particular some very interesting work has been carried out by Dr. R. B. Harvey, of Minnesota, on the growth of plants entirely in artificial light. Many plants were grown from seed to seed, in the continuous light obtained from 200-watt and 1,000-watt nitrogen-filled Mazda lamps, used, of course, in conjunction with suitable reflectors. The same system has been applied more recently to the growing of grass on golf greens, which received world-wide publicity in the newspaper Press. As the results of these recent experiments seemed to show a great deal more promise than those performed with ordinary illumination in earlier days, the writer decided to carry out some work in this connection at East Grinstead, and obtained some very interesting results. 1,000-watt Mazda lamps and suitable reflectors, two feet in diameter, were used for this purpose. The lamps were placed three feet above the level of the tops of the pots which contained the plants under treatment. The tests were carried out on the ordinary plants which are usually to be found in greenhouses associated with a garden of fair size. In every case the progress of the plants was most remarkable. Daffodils and Lent lilies, when placed under the light for six hours a night, flowered in four days, growing about three-quarters of an inch a day. Narcissi flowered in seven days. In

each case, the plants were placed under the light when the buds were just beginning to form. The control plants placed away from the light took four weeks to flower. These experiments were carried out in rather an empirical manner, as the chief object was to obtain a general idea as to the value or otherwise of intensive illumination. From a scientific point of view they were entirely satisfactory, but the work would have been costly from the point of view of electricity consumption, if it had not been for the fact that the electricity supply on the writer's farm is generated by water power. By means of a self-winding automatic time switch, the lamps were switched on at midnight and off at six a.m., *i.e.*, the current was used for lighting the plants when not required for any other purpose. Further, the use of the time switch made certain as to the exact period during which the light was on.

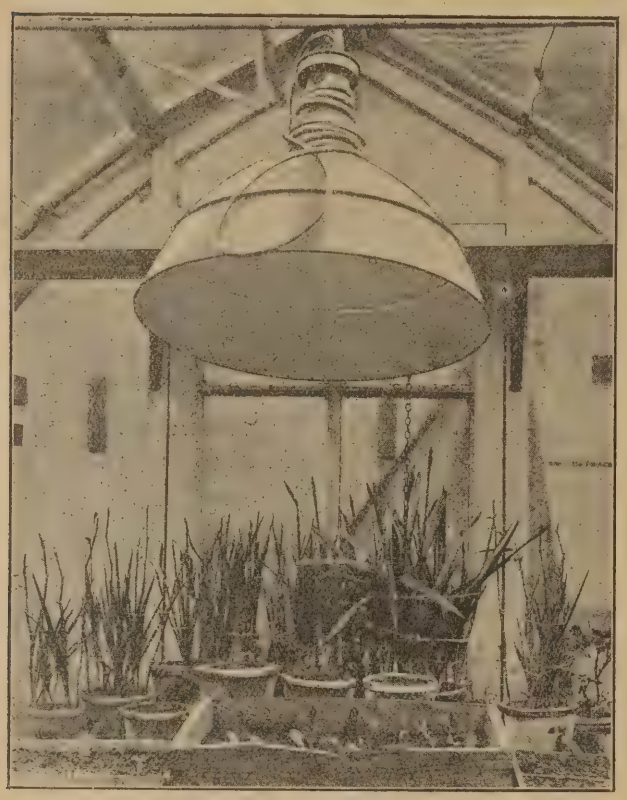

Fig. 1.—Reflector used for Illuminating Plants.

Fig. 2.—Four Days later—the effect of Artificial Illumination.

Since to obtain this very intensive illumination the lamps have to be placed so close to the plants, the number of plants that can be lighted at a time is necessarily very limited, which means that the cost per plant, even at one penny per unit, is very high, in fact, too high, except under special circumstances such as to enable a market gardener to get some plants forward for Christmas or Easter or other times when the public are prepared to pay extraordinarily high prices for them. For certain scientific purposes, such as seed breeding, cost is of small importance. In America, by this means, it has been possible to obtain four crops of wheat in one year and thus in that period it has been possible to establish the fixedness or otherwise of a new breed of seed, instead of having to wait four or five years. As is well known, in the breeding of new seeds, only time will prove whether a new variety will remain true to type or not; many excellent samples of seed revert to an inferior ancestral stock in the course of several generations, hence the very great importance of knowing whether the new variety is really a stable form.

In casting round to ascertain whether there might not possibly be some commercial advantages in electric lighting for market gardeners, other than for a special seasonal trade, the discovery was made by the writer that if the plants in greenhouses are given, in turn, one night's treatment, they make remarkable progress. In point of fact this progress is very much greater than the average per day if the plant were illuminated for a number of days. As one night's treatment improves the plants so much, it is well worth the while of an enterprising market gardener to treat all his plants in turn in this way. The practical method for carrying this out would be to suspend the lamps from an overhead runway of galvanised wire, so that each lamp can easily be moved into a fresh position for each night's treatment, as this would involve less labour than moving the plants to positions under fixed lamps.

The next commercial application discovered was in connection with the pricking out or transplanting of seedlings. Every gardener, amateur or otherwise, is fully aware how, on the day after the transplanting of seedlings, most of them fall over and wilt. Now it is well known that any check in the growth of either a plant or an animal when young has its effect ever after. The discovery was made, however, that when such seedlings were exposed to intensive illumination for one night, not only did they not wilt, but with one night's treatment they appeared to have put on a week's growth and to be exceptionally strong and healthy.

The illustrations, figs. 1 and 2, give an idea as to the type of reflector employed and its location in relation to the plants. It must be admitted by everyone that the two illustrations show a very striking difference as the result of four days' lighting.

In recommending this mode of lighting to market gardeners, the obvious course is to advise its application in conjunction with automatic time switches and the use of the light between midnight and six a.m.—at which time, undoubtedly, most of the electricity supply undertakings would be prepared to grant special rates. It is a matter of great interest to all associated with the electrical engineering and market gardening industries to find that there are excellent possibilities of commercially applying what has hitherto only been a scientific feat. True, the scientific work, so far, is still in its early stages and cannot by any means as yet be described as an exact science. To begin with, different varieties of plants seem to grow better under different intensities of illumination, thus there is scope for considerable economy in the application of the light. For the time being 1,000-watt gasfilled lamps, placed three feet above the plants, will give satisfactory results, but in many cases undoubtedly more light is being supplied than is necessary, yet, on the other hand, it is only just sufficient for many plants. Environment must always play its part, and the gardener must always be a man who is skilled in the culture of plants. For one thing, if care is not taken, some plants will become

too "leggy," *i.e.*, lengthen out too much, or else show effects of forcing.

In 1918 Dr. Steinmetz, in conjunction with Mr. J. L. R. Hayden, grew beans under five 500-watt, gas-filled lamps, placed three feet above the ground, and giving an intensity of illumination over the plants of 700 lumens per square foot of ground. The power consumption over the bed in the 44 days, during which these lamps were kept burning day and night, was 55 watts per square foot. They found that the rate of growth and development was nearly double that of a control plot which received only daylight.

Fig. 3.—Electrically-lighted Glass-houses.

Plants may be roughly classified from a light point of view as (*a*) those which respond to long days and therefore bloom in the summer time, and (*b*) plants which require only a short day (less than 12 hours) and therefore bloom early in the spring or late in the autumn. There is still another class (*c*) to which the length of day seems immaterial, and which therefore bloom all the year round.

It has always been assumed that ultra-violet rays were a most important factor in plant growth, hence many experimenters have employed mercury-vapour arc lamps. However, it is of interest to realise that the half-watt lamp, when used intensively, can produce better results, because, after all, a half-watt lamp is an article which can easily be obtained commercially on the market and is actually in stock in every town of any size. On the other hand, mercury-vapour lamps are very much more difficult to obtain and require greater care in handling. Further, it is doubtful whether many electrical contractors would even know where to place an order for one. Still the ultra-violet ray lamp may yet be found to have a field of its own.

There is quite an extensive bibliography on the treatment of plants by artificial light. Arrangements have been made to insert a list, in due course, in the new journal *Electro-Farming*. Hence much valuable information on the artificial illumination of plants is already available for those who desire to follow up the practical applications.

Another commercial use of electric light by the market gardener is for the prosaic task of cutting and picking blooms at the last minutes before dispatch, which often means after sunset. Fig. 3 shows a range of glass-houses which are so lighted. Incidentally, they are wired with Kaleeko, the junction boxes being made moisture-proof with the aid of Kalaloid composition. Damp, of course, is the bugbear of greenhouse wiring.

Electric heating does not at present seem to come within the range of practical politics for greenhouse work. It has, however, been used successfully under conditions where power can be obtained very cheaply. The writer recently had an opportunity of inspecting some greenhouses heated in this way. One of the very great difficulties that has to be contended with is the moistness of the atmosphere and considerable trouble is experienced with switches; in fact, it is wise to employ a totally-enclosed iron-clad switch for this purpose. One successful method of arranging the heating is to employ bare wires run around the greenhouses, so as to get an effective distribution. These heating wires are protected by galvanised sheds or inverted guttering, from the drops of water falling from the plants overhead.

When electric light is installed on a market garden other applications of electricity will naturally follow. The four most important uses will be (*a*) for the pumping of water to tanks for use in watering cans; (*b*) for automatic watering devices; (*c*) for distributing liquid manure; and (*d*) for spraying insecticides in powder and liquid forms. Then the electric vehicle for the transport of the crops to the railway station or wholesale market must not be overlooked. Many market gardeners have developed so far to-day that they already employ six-ton vehicles.

Another Wireless Exhibition.

A Review of the Novelties at the Horticultural Hall.

(*Concluded from page* 646.)

Amongst the loud-speakers displayed, the Western Electric "Kone" was demonstrated in the main hall with the aid of the "public address" system. It is a fine instrument, though the best results are obtained only when real power valves are used. A novel, if somewhat expensive, instrument is the "Statophone," which was shown by Messrs. C. F. Elwell, Ltd.

A New Loud-speaker.

Its action is described as electrostatic, the conventional magnetic system with its diaphragm or reed having given place to a very light metallised membrane; in fact, the speaker consists essentially of a condenser, one plate of which is a heavy casting, whilst the other is flexible and constitutes the diaphragm of the instrument. A varying potential applied across the plates sets up corresponding mechanical forces, causing the flexible plate to move. In practice, the diaphragm consists of a single lamina of mica of the order of 1 mil thickness and approximately 12 in. diameter, silvered on one side to render it conducting and clamped round its circumference between two heavy metal rings. The fixed plate is insulated from the clamping rings by ebonite insets, and is machined so as to approach the diaphragm to within a few mils. The associated receiving equipment consists of a detector followed by a resistance-capacity coupled amplifier terminating in a filter circuit which applies the signal potentials to the loud speaker. A constant potential is also applied directly across the loud-speaker plates by means of a high resistance connected between the constant potential side of the filter and the valve filaments. Tonal purity rather than noisy volume has been sought, and the "Statophone" speaker with its special receiver are mounted together in a cabinet measuring 20¼ by 15¾ by 8¾ in. One model employs a crystal detector and a 3-stage resistance amplifier, and the other is a 4-valve set with reaction in the aerial circuit.

Thermionic Valves.

The number of different types of thermionic valve suitable for reception purposes now obtainable in the British market is at least 90; the selection of the best for any one particular function is accordingly of considerable importance, and it might almost be said difficulty too. Much depends on the interpretation of the varied characteristics of the several types, the choice being limited by conclusions reached regarding cost,

battery power needed, and, as a rule, what may be considered undesirable mechanical or constructional features.

Amongst those seen at the show, the Fellows Magneto Co.'s "Louden" valves are remarkable for their low price; the bright emitters take 0.4 A at 4.5 V, and the dull emitters need only 0.1 A at from 4 to 6 V according to type, the anode voltage being from 40 to 80 in both cases. The valves exhibited by Cleartron Radio, Ltd., are of American design, but are now being made in a Birmingham factory. The "multi" valves shown by the Nelson Electric Co., Ltd., are interesting in that each has three filaments which can be brought into use one or two at a time as desired by a simple switch device incorporated in the cap, as indicated in fig. 5. The switch consists of two arms pivoted scissors-like on one of the valve legs. When one filament is desired, the arms should be brought together with the tips in contact with one of the three studs in the cap base. When it is to be used as a power valve and two filaments are required, the arms should be opened in the opposite direction, so that the tips come in contact with any two of the studs, thus paralleling two filaments. Two new types were recently introduced; one operates at 1.8 V and 0.35 A, and the other at 3 V and 0.06 A.

Fig. 5.—A 3-filament Valve.

The Stethophone.

Of the various sounds produced within the heart or lungs, the actual intensity is not in itself of fundamental significance; for example, certain serious organic lesions may make themselves evident only by faint murmurs. Hence it is of pathological importance that means should be available of hearing the

Fig. 6.—The "Stethophone."

slightest sounds above the more general noises, and the "Stethophone," which was demonstrated by the Western Electric Co., Ltd., is a precision apparatus designed to amplify just those faint murmurs which are of such vital importance. It consists of the following elements:—An electromagnetic transmitter, a three-stage amplifier with potentiometer control, a selected group of electrical filters, and a multiplicity of receivers for observers, of which, perhaps, the filters are the most interesting. Normally there are five; a high-pass 130-cycle filter, a low-pass 130-cycle, a low-pass 400-cycle, a low-pass 650-cycle, and a low-pass 1,100-cycle filter. The first two eliminate interfering noises, including sounds of the human voice. The 400-cycle filter is useful for observing presystolic and low-pitched systolic and diastolic murmurs. The 650-cycle is valuable for high-pitched murmurs and low-pitched rales, whilst the 1,100-cycle passes only the very high-pitched murmurs and rales. The valve amplifier is distortionless between the limits of observation, and of course the degree of magnification can be increased to any desired extent. The apparatus, which is shown in use in fig. 6, requires 6-volt and 130-volt batteries for its operation, and when mounted for use in hospitals resembles a tea-wagon in appearance. There are many applications for this remarkable instrument; for example, by the addition of a recording galvanometer, photographic reproductions of heart and chest sounds can be made and retained as permanent records.

The Audiometer.

Another exhibit of the Western Electric Co., Ltd., was a portable instrument suitable for use in delicate functional and diagnostic examinations by otologists; it may also be used to apply standard hearing tests for physical examination purposes, and measurements sufficient to form a picture accurately indicating the character and deficiencies of acuity can rapidly be taken. Such readings, when plotted with the zero line representing normal hearing, is called an "Audiograph."

The audiometer, fig. 7, is acoustically a generator of pure tones which may be varied both in pitch and intensity at the will of the operator. The oscillator has

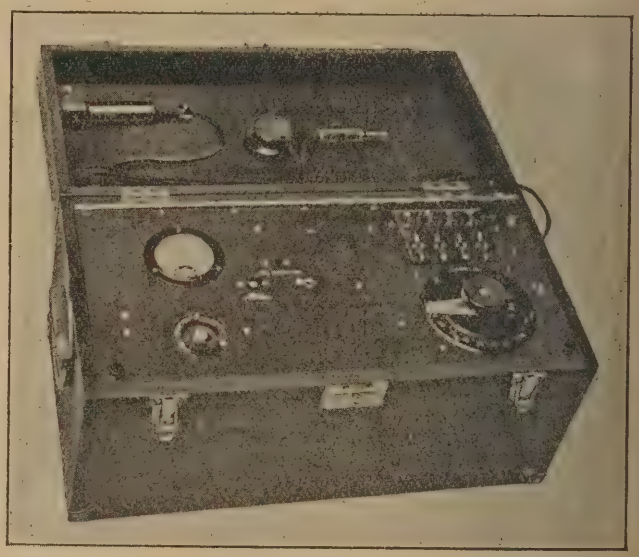

Fig. 7.—The Audiometer.

a frequency range which extends from 64 to 8,192 double vibrations or cycles per second. This range is divided into eight steps of frequency, 64, 128, 256, 512, 1,024, 2,048, 4,096, 8,192 cycles per second, and the desired steps are selected by the operator with keys that control the oscillator coils and condensers, and the circuits are arranged so that if two keys are thrown at one time, no oscillation is produced, thus preventing incorrect results. A "Wecovalve" is used in the oscillating circuit, while a volt-milliameter is provided to measure the filament current and the plate voltage, so that the power supply to the valve may be maintained at the proper value. The source of power for both the filament and plate of the valve is dry batteries. The attenuation potentiometer, which forms part of the audiometer, consists of a resistance network connected to a 24-point intensity control which serves to vary the output of the oscillator. The movement of the switch from one point to the next causes a change of five sensation units in the output; the sensation unit being approximately the smallest change in intensity perceptible to a person of normal hearing.

The Metering of Three-Phase Power.

The Effect of Abnormal Conditions on Single-phase and Polyphase Meters.

By GEORGE D. MALCOLM.

When considering the question of metering a three-phase power supply, it is always safe to assume that at some time or other conditions will arise which will destroy equality between the phases, even when an initial test proves the load to be perfectly balanced. One phase may become open-circuited due to a fuse blowing or to a faulty winding, and the motor may still continue to function on light loads, either with or without the knowledge of the consumer. I have known of three-phase motors running for quite long periods with one line fuse "blown," starting being effected by manual "assistance" at the belt. The fault would probably be rectified before the date of the next meter reading, but it is the consumption during the faulty period that has to be dealt with, and unless suitable means of integrating are provided, it is extremely difficult to compute this correctly. It is imperative, therefore, if accurate registration is desired, that equipment be installed capable of coping with abnormal conditions.

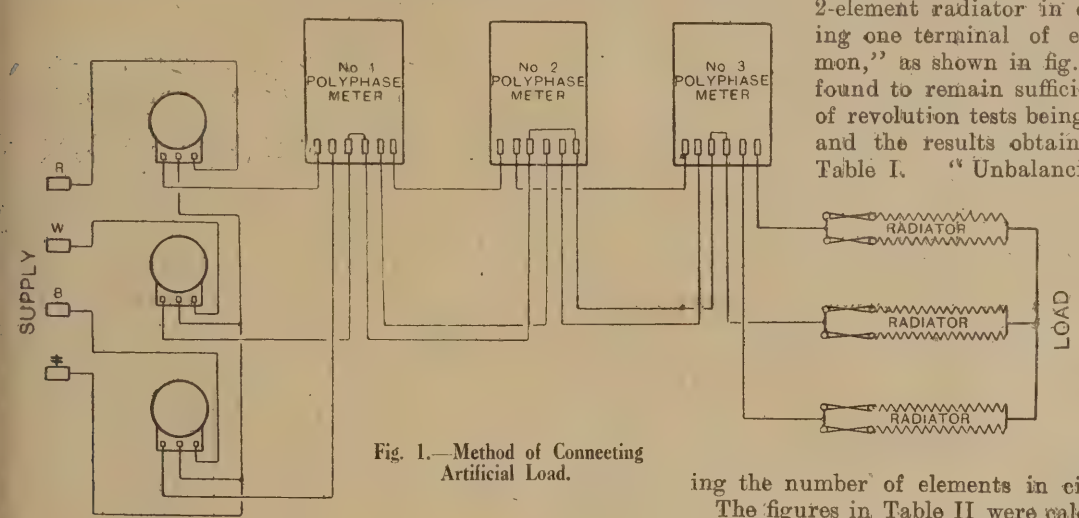

Fig. 1.—Method of Connecting Artificial Load.

With a view to acquiring data on this subject, experiments were made to ascertain what discrepancies could be expected under the following four systems of metering on a three-phase, 4-wire network:—

System No. 1.—One single-phase 240-V meter. Registration multiplied by 3.

System No. 2.—Two single-phase 240-V meters. Registrations added and result multiplied by 1.5.

System No. 3.—Three single-phase 240-V meters. Registrations added.

System No. 4.—One three-phase 3-wire 415-V meter. Direct reading.

The first series of tests was carried out for the purpose of demonstrating the relative performances of single-phase and polyphase meters on a star-connected, non-inductive, three-phase load under various conditions. An easily controlled and practically non-inductive artificial load was obtained by connecting one 2-element radiator in each phase and making one terminal of each radiator "common," as shown in fig. 1. The current was found to remain sufficiently steady to allow of revolution tests being taken on all meters, and the results obtained are tabulated in Table I. "Unbalancing" was effected by manipulation of the radiator switches, there being one switch per element. The precise condition under which each test was made can be gauged from column 2 (Table I), the figures indicating the number of elements in circuit on each phase.

The figures in Table II were calculated from Table I, and show clearly the difference in the number of units chargeable under the four systems. It will be readily seen that systems Nos. 1 and 2 are far from satisfactory under the extraordinary circumstances which sometimes arise. The red phase meter represented the service meter in system No. 1, and the red and blue phase meters provided the figures for system No. 2.

In the second series of tests the three radiators were substituted by a 2-h.p. three-phase motor, and, as this was running light, a highly inductive load was the result, especially when the unbalanced conditions were created. The load, however, was too unsteady to allow for revolution tests to be made, so dial tests were taken over a period of days, and the results obtained are set out in Table No. 3.

It will be noticed that under certain conditions one single-phase meter reverses, whilst another is speeded up, the total power being the algebraical sum of the three. Assuming that the meters register correctly in either direction, this does not matter much in the laboratory, but from a practical meter-reading point of view it is very unsatisfactory, as it is sometimes difficult to ascertain whether the difference in the readings is due to external influence, or to a defective meter. In any case, careful investigation *in situ* is called for, with the attendant loss of time and delay in the issue

TABLE I.

Relative Performances of Single and Polyphase Meters on a Star-connected Non-inductive Load.

of accounts. If the duration and cause of the trouble cannot be found, the resultant estimated consumption is a matter for compromise between the undertaker and the consumer.

Table II.

Units chargeable to consumer in respect of three-phase supply to a non-inductive load under four systems of metering. Calculated from data in Table I and reduced to a percentage basis to facilitate comparison.

Condition of load.	True units.	System No.			
		1	2	3	4
Balanced—Full load	100	101	101	101	101
„ Half load	„	101	101	101	102
Unbalanced—Red phase light ...	„	79	99	105	104
„ White „ „ ...	„	120	120	106	105
„ Blue „ „ ...	„	118	98	105	105
„ Red „ heavy ...	„	128	113	107	108
„ White „ „ ...	„	93	93	103	102
„ Blue „ „ ...	„	91	106	101	101
Blue phase fuse drawn	„	156	78	103	102
White „ „	„	156	156	104	101
Red „ „	„	0	78	105	102
Blue phase winding open circuited	„	162	81	107	99
White „ „ „	„	159	159	106	102
Red „ „ „	„	0	78	104	102

they do, however, represent what occasionally occurs in practice, and one must be prepared to meet them.

It would appear, from the results obtained, that the only satisfactory means of doing so, as far as three-phase industrial power metering is concerned, is by the use of suitable three-phase, unbalanced load meters.

The question of capital outlay is often an important factor when deciding on the method of metering to be employed, and a comparison of the relative costs of instruments for the four systems under consideration may be interesting. Taking present-day "ring" prices for meters of 10-ampere capacity, and assuming the price of one single-phase meter to be unity, the comparative costs are as follows:—

System No. 1 ...	1
„ No. 2 ...	2
„ No. 3 ...	3
„ No. 4 ...	2.47

Having regard to the inaccuracies which may occur under systems 1 and 2, I think we may safely rule them out, and this leaves the choice between systems Nos. 3 and 4. Here the advantage lies with the latter, both as regards price and performance, as has been shown. The fact that there is only one reading dial on the polyphase meter is also a point much appreciated by consumers, and incidentally by the departments dealing with meter readings and accounts.

TABLE III.—Relative Performances of Single and Polyphase Meters on Inductive Power Load, 2-h.p. Motor Running Light.

Condition of load.	Units registered.							
	Single-phase meters.				Polyphase meters.			
	Blue.	White.	Red.	Total.	No. 1.	No. 2.	No. 3.	Average.
Unbalanced.—Blue phase light	8·4	− 9·4	16·6	15·6	15·8	16·6	13·7	15·4
„ White phase light	9·9	5·8	− 6·3	9·4	9·7	10·4	9·8	9·9
„ Red phase light	− 7·1	10·3	6	9·2	8·9	10·8	9·2	9·6
Blue phase fuse drawn	0	− 5·1	10	4·9	5·2	5·3	4·3	4·9
White phase fuse drawn	7·9	0	− 3·7	4·2	4·5	4·4	4·3	4·4
Red phase fuse drawn...	− 5·4	10·8	0	5·4	4·6	5·9	5·5	5·3

Table IV.

Units chargeable to consumer in respect of a three-phase power supply (inductive) under four systems of metering as in Table II.

Calculated from data in Table III and reduced to a percentage basis, assuming average of polyphase meters to be correct.

Condition of load.	System No.			
	1	2	3	4
Unbalanced.—Blue phase light ...	324	244	101	00
„ White „ ...	−191	55	95	100
„ Red „ ...	188	−17	96	100
Blue phase fuse drawn	610	310	100	100
White „ „	−250	143	95	100
Red „ „	0	− 53	102	100

Table IV is similar to Table II, but owing to the inductive nature of the load and the complications caused thereby, the differences are greater than in the case of the non-inductive load.

Many of the conditions produced were extreme, but

I have not included the use of two separate single-phase meters operating on the 2-wattmeter method, for here again arise the complications due to the reversal of one meter during periods of low power factor, and the uncertainty as to whether the difference between the readings of the two meters is due to this cause or to a defect in one of the meters. From the cost point of view there is little to be gained, as, owing to the shunt coils having to be wound for phase voltage instead of for the voltage between phase and neutral, the price per meter is higher. Using the same constant as before, the cost factor for two 10-ampere single-phase meters would be 2.46. When one considers the time spent in investigating the cause of unequal readings, in additional meter reading, additional records, and the like, the slightly higher cost of the polyphase meter is amply justified.

The writer desires to express his thanks to Mr. W. C. P. Tapper for his courtesy in permitting the publication of the test figures.

Electricity Supply in Great Britain.—IV.

Surrey and Sussex.

In the notes which accompanied the map of Kent and the map of Herts. it was pointed out that most of the *unshaded* area in those two counties was covered by the Acts of certain undertakers, but it should be noted that such is not the case in the map of Surrey and Sussex, which we reproduce this week. So far as we have been able to ascertain, no statutory powers for the supply of electricity are held, nor have any yet been applied for, in respect of the areas which are not hatched on the map on the opposite page.

In the list of undertakers concerned in the supply of electricity in Surrey and Sussex, given on p. 692, it is interesting to note that, including the Metropolitan Electric Supply Co., Ltd. (which has bulk supply powers in the Urban Districts of Egham and Chertsey and the Parish of Thorpe), there are 20 undertakers, marked by an asterisk, whose areas of supply are wholly or partly included in the London and Home Counties Electricity District.

The following figures for the Administrative Counties of East Sussex, West Sussex, and Surrey, with the associated County Boroughs, have been obtained from the 1921 Census :—

Acres.	Persons.	Resident families.	Buildings not containing dwellings.
1,394,304	1,658,083	376,337	19,953

The map itself has been prepared by using the 1917 Boundary Commission maps (by permission of the Controller of H.M. Stationery Office). Since 1917 the following alterations have been made :—

(1) Part of the Parish of Trotton has been transferred to the Parish of Iping.

(2) The Borough and Parish of Guildford has been enlarged by the inclusion of part of the Parish of Artington.

(3) The County Borough of Brighton has been extended so as to include part of the Parish of Patcham, the added part being transferred to the Parish of Preston in Brighton County Borough.

(4) Part of the Parish of Farnham Rural has been transferred to the Urban District and Parish of Farnham.

(5) The boundary line between Croydon County Borough and Mitcham Urban District has been slightly amended.

(6) The Parish of Hollington Saint John has been merged into the Parish of Hastings, which is now coextensive with the County Borough of Hastings.

The Institution of Electrical Engineers.

Inaugural Address by R. A. CHATTOCK, President I.E.E. ***(Abstract).***

It is an illuminating fact that two chief engineers of large electricity supply undertakings have been selected during the past session and the present session to this high office, and I cannot help thinking that the intention underlying this was largely influenced by the fact that at the present time His Majesty's Government is interesting itself in the present position and the future of this particular section of the industry, and in consequence the subject is becoming one of great public interest.

The report of the Electricity Commission, embodying as it does such a vast amount of statistical matter in connection with the generation and supply of electrical energy in this country, is, in my opinion, a most valuable book of reference for supply engineers.

The general review embodied in the report is particularly valuable, including as it does average figures for the whole country. It is gratifying to know that the cost of production is coming down, and the cost to the consumer is being lessened. It is, I think, obvious that the improvement year by year has been materially assisted by the general policy of the Commissioners. The task that they are carrying out can only be regarded as colossal. One hears complaints that things are not moving fast enough, and that after six years only one Joint Authority has so far come into existence. In my opinion, far better and more lasting progress can be made by going slowly and thoroughly considering each step. I should like to suggest to the Commissioners in a spirit of friendly criticism that, when far-reaching and costly changes are contemplated, a free and frank discussion with the interests involved would be of far greater value to the commercial community than the production of a cut-and-dried proposal that has to stand antagonistic criticism, which might quite easily have been disarmed by reasonable compromise.

It seems to me that to compare the performance of steam-operated stations on a "pounds of coal per unit generated" basis only is rather misleading. What we are all aiming at is to produce and distribute electricity as cheaply as possible.

A station using fuel of a very poor calorific value at a low price per ton can produce electricity quite as cheaply as a station using high-priced fuel of high calorific value, although the fuel consumption per unit and the thermal efficiency of such a station may compare unfavourably with those of the station using the expensive fuel.

Again, if the distillation of coal proves to be a commercial possibility, from 30 to 70 per cent. more weight of coal will have to be handled to produce a given quantity of electricity, and whilst it may pay handsomely to adopt this process, the number of pounds of coal used per unit will of course compare very unfavourably with the figures obtained in a station burning coal to destruction.

I think, therefore, that a better method of comparison would be the cost, rather than the weight, of the fuel per unit generated, and this cost would have to take into account the sale of any by-products obtained in any process of distillation.

The selling price of these products depends on world-wide competition with products obtained from sources other than coal. It also depends on the demand for these products in the available markets. The gas industry at the present time is suffering very severely from its inability to dispose of the by-products at a remunerative figure. It is therefore very desirable to realise that if processes of this kind are adopted, a serious commercial risk will be run which may have an adverse effect on the selling price of electricity.

Boiler-house efficiencies of 90 per cent. can now be obtained, compared with 80 per cent. a few years ago. The difficulty of obtaining, for lining the furnaces, a refractory material that will stand up to the high temperatures without undue maintenance cost, has been solved by screening the furnace walls with water tubes which are coupled up to and form part of the boiler itself. The circulating system through these tubes is kept distinct from the main circulation through the boiler, and very high rates of evaporation—in some cases as much as 50 lb. per square foot of heating surface—are obtained from these tubes, apparently without any consequent disadvantages.

There are five great advantages in the use of pulverised fuel, as compared with boiler-house practice up to the present. These are :—

(1) Greater efficiency in operation.

(2) Greater capacity of individual boiler units—it being possible to install boilers each having a capacity of 300,000 lb. of steam per hour, with single combustion chambers.

(3) Greater reliability of the pulverised-fuel furnace, whilst the regulation of the temperature can be controlled with wonderful accuracy and consistency.

(4) The reduction in the cost of labour in operating such boilers is nothing less than extraordinary. One attendant can control the operation of a battery of boilers having a combined capacity of 1 million lb. of steam per hour.

(5) The efficient use of all classes of fuel. It is possible to use efficiently the poorest classes of fuel, which have hitherto been looked upon as refuse and cannot be burnt on mechanical stokers. Such a development will be of national importance, as it will make available for service the refuse heaps of old colliery workings which have been accumulating for many years.

It is evident that considerable economy, both in capital cost and in operation, can be looked for in the future.

We are now told that pulverisation has to be combined with low-temperature carbonisation in order to obtain a still further reduction in the cost of production. The proposal sounds more attractive than the ordinary low-temperature carbonisation process, as the resultant fuel is obtained in a pulverised form and can be sent direct to the boiler furnaces. The process, however, has yet to be demonstrated and proved before it can be accepted for general use.

In this country the load factor obtained in the majority of the undertakings is between 15 and 30 per cent. Those undertakings which have a higher load factor have the benefit of long-hour demand, such as is created by railway traction, colliery pumping, and similar loads. Experience in America also goes to show that a load factor of 45 to 50 per cent. can be obtained where these long-hour loads are available.

The statistics issued by the Electricity Commission show that only six undertakings in this country obtain a load factor exceeding 45 per cent. The combined load factor for the whole of Great Britain was of the order of 28 per cent. in 1922-23.

The reduction in load factor that has occurred during recent years has been due to three causes:—

(1) The bad condition of most manufacturing industries.
(2) The reduction in working hours.
(3) The phenomenal increase in the lighting connections in residential districts.

The reduction in working hours in factories has had the greatest effect in reducing the load factor, and if this is felt so severely on the capital charges of the supply undertakings, how much more must it be felt on the capital outlay of factories. One can only hope that, when trade does revive, it will be possible to run two or three shifts of men in the factories and so improve the serious position in which we are all placed at present.

The load factor of a residential lighting supply is approximately 10 per cent. It is obvious, therefore, that if this supply is increased to a relatively much greater extent than the power supply, it will have the effect of reducing the average load factor and increasing the cost of production. It is therefore incumbent upon supply engineers to do their utmost to foster the use of electricity for cooking and heating. The most telling way is to arrange an attractive tariff, and the one that seems to find most favour with the average householder is that under which the consumer pays per quarter a fixed sum, and a low charge per unit for every unit used in the house—whether for lighting, cooking or heating.

The suggestion that has been made in certain quarters, that the general load factor throughout the country can be improved by linking-up all the big centres of supply and by taking advantage of the better diversity factor so created, is in my opinion outside the realms of possibility. This proposal has been tried to a certain extent in America, and experience has shown that the peak load rises as fast as the output. The expansion of these large systems by means of heavy trunk lines running long distances has not had the effect of improving the load factor on the system; on the contrary, it is tending to decrease this as the area of supply grows larger.

In this country there is no evidence that the habits of the population vary as between one large industrial centre and another. The hours of work in the factories are approximately the same, and there is no reason for believing that the peak load in one district would occur at a substantially different time from that in another.

It does not therefore appear, from the point of view of improving the load factor, that there is any justification for incurring the enormous expenditure that would be necessary to link up all the big centres in the country with trunk mains of sufficient capacity to enable their effect to be felt in the operation of the generating stations.

(To be concluded.)

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The Western Electric's New Name.—The Western Electric Co., Ltd., of London, will from October 31st, 1925, be known as "Standard Telephones and Cables, Limited." The registered and executive office will remain at Connaught House, Aldwych, W.C.2. We have already published some particulars respecting the sale to the International Telephone and Telegraph Corporation of the International Western Electric Company, by the Western Electric Company Incorporated. Under this new ownership, the International Western Electric Company will in future be known as the International Standard Electric Corporation, and will continue to hold exclusive licences under the foreign patents of the Western Electric Company Incorporated in the telephone and telegraph field, and will also continue to act as the exclusive distributors outside of the United States, Canada, and Newfoundland, for all Western Electric manufactures. The change in ownership of the International Western Electric Company, with which the Western Electric Co., Ltd., of London, has been affiliated, will not involve any material changes in the organisation or in the broad policy that has always been followed by the latter company, unless such changes are of a progressive nature.

E.D.A. Activities.—The most recent publication of the British Electrical Development Association is an illustrated folder (E.D.A. No. 582) entitled "People Buy where the Light is Bright." This, as its title indicates, deals with shop lighting, and it contains a list of retail trade journals covering many industries in which a series of E.D.A. advertisements (reproduced in the pamphlet) will appear during the next few weeks. Among the various conferences, &c., for which the British Electrical Development Association and its staff will be responsible during the coming month is an event at Leighton Buzzard on November 24th. A town's meeting is being organised by the Leighton Buzzard Traders' Association, at which Mr. V. W. Dale will deal with "The Use of Electricity in the Home."

Patents in Turkey and Latvia.—The *Board of Trade Journal* reports that Turkey and Latvia have acceded to the Industrial Property Convention, and the provisions of Section 1 of the Patents and Designs Act, 1907, as amended by the Acts of 1914 and 1919 are accordingly in force as from August 10th last in the case of Latvia, and as from October 10th last in the case of Turkey.

A Radio Campaign.—In order to popularise "Sterling" and "Marconi" radio products, the Marconiphone Co., Ltd., are supplying to dealers a set of effective showcards, &c. "Marconi" valves are represented by a showcard, a lampshade, and a circular mirror. The Sterling "Mellovox" loud speaker is advertised by a stand-up cardboard cut-out of a lady conducting an orchestra, and other "Sterling" radio apparatus provides a subject for another ingenious cut-out.

Slide Rule for Wire Rope.—Messrs. Bruntons, of Musselburgh, have sent us a sample of an ingenious slide rule, which gives the essential particulars of the four types of steel wire rope that are most widely used; for each of these one setting of the slide gives the diameter and circumference, weight per yard, and guaranteed actual breaking strain of five qualities of wire. It is not a slide rule in the ordinary sense, having no logarithmic scales; the slide carries tabulated data, of which the appropriate items appear simultaneously at four windows in the cover—one set for each of the four types. The price is 2s. 6d.

Lamp Publicity.—Philips Lamps, Ltd., has produced a number of showcards and devices advertising its lamps, and is inserting advertisements in the leading newspapers and magazines. The company also offers to specially dress the shop windows of any members of the trade who request it to do so.

The Shannon Scheme.—It is reported that as the result of conferences between the Irish Free State Government and the National Executive of the Irish Labour Party a basis of negotiation has been found which should result in a satisfactory settlement of the dispute which is holding up the Shannon power scheme. The contractors for the scheme, Messrs. Siemens-Schuckert & Co., require 20,000 tons of coal, and have announced their intention of purchasing this in the best market—not necessarily Germany. They state that they have already placed large contracts with Irish firms, including orders for cement and other materials.

Merchandise Marks.—The Federation of British Industries has drawn the attention of the President of the Board of Trade to the increased importance of the matter of marking imported goods with their country of origin, in view of the support which members of the Government have given to the proposal that the British public should be encouraged to purchase British-made goods. It is considered that regulations can be devised which will be effective in providing means for the buyer to distinguish foreign from British goods, at the same time protecting all legitimate interests, such as the *entrepôt* trade.

The King's Roll.—Sir A. Steel-Maitland, the Minister of Labour, stated last week that it was the intention of the Government to pass a resolution through Parliament definitely instructing Government departments to place contracts only with firms whose names were on the King's Roll (for the employment of disabled ex-service men), in all but exceptional cases. Hitherto this principle has been informally adopted, but the Government's action will place the matter on a more definite basis.

Dublin Radio Exhibition.—An exhibition of radio apparatus, in which a number of the leading British firms are participating, is to be held in the Mansion House, Dublin, from November 11th to 14th.

Contractors Visit Cosmos Works.—On October 14th, a party of electrical contractors from the London area visited the Cosmos Lamp Works, Brimsdown, Middlesex, in connection with the "Cosmos" Lamp Campaign. After luncheon at Odone's Restaurant, Victoria, S.W.1, the party proceeded by char-a-banc to the lamp works of the Metropolitan-Vickers Electrical Co., Ltd., at Brimsdown, a very interesting tour of inspection of the lamp-making department, the heating and cooking department, and the radio valve department, being made. The return journey was broken in order to permit members of the party to see the company's London showrooms in High Holborn.

Trade Announcements.—New showroom premises at 37, Monson Road, Tunbridge Wells, have been opened by the County Wireless Services, Ltd.

Mr. J. Carman, electrical engineer and wireless expert, of Ramsgate, has opened a branch business at 4, Carlton Parade, Broadstairs.

The Marconiphone Co., Ltd., has opened a branch depôt at 16, Water Street, Liverpool, for the supply of wireless stores to West Lancashire, Cheshire and North Wales.

Mr. D. M. Mason, A.M.I.E.E., late chief assistant engineer at the factories of the Gramophone Company at Hayes, and for a number of years electrical superintendent at Croydon electricity works, has commenced business on his own account at Grafton House, Golden Square, London, W.1, as an electrical engineer and contractor specialising in industrial power plant and factory equipment.

Catalogues and Lists.—The Suffolk Iron Foundry (1920), Ltd., Gipping Works, Stowmarket.—A booklet dealing with oxy-acetylene welding with "super-silicon" rods.

The Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—An illustrated pamphlet containing details and prices of "Siemens-Xcel" domestic electrical appliances, including fires, cookers, vacuum cleaners, &c. Also a showcard in colours effectively advertising "Siemens-Xcel" electric fires.

The Engineering & Lighting Equipment Co., Ltd., Sphere Works, St. Albans, Herts.—Folders Nos. P1227 and 1228, dealing respectively with side-street lighting fittings and standard industrial reflectors.

The Wainwright Manufacturing Co., Ltd., 531, Forest Road, Walthamstow, E.17.—An illustrated and priced catalogue of radio components, including condensers, coil holders, crystal detectors, &c.

Messrs. Wootton & Co., Ltd., High Street, Ponder's End, Middlesex.—A mailing card giving dimensions and prices of wooden backboards and fittings.

Messrs. Falk, Stadelmann & Co., Ltd., 83-93, Farringdon Road, E.C.1.—List No. P1061, containing particulars and prices of "Sunstar" shop-window lighting reflectors and fittings. Also Catalogue No. 559, containing full particulars of "Efescaphone" receiving sets and "Efesca" components. Illustrated and priced.

The Dominion Rubber Co., Ltd., 47-48, Farringdon Street, E.C.4.—A leaflet illustrating a "Matchless" conveyor belt 3,000 ft. in length and 36 in. wide.

The Sloan Electrical Co., Ltd., 8, 10, and 12, Golden Lane, E.C.1.—An illustrated price list of white porcelain insulators and ironwork, and a catalogue of electrical accessories, wires and cables.

The British Thomson-Houston Co., Ltd., Rugby.—Lists A.G. 188, describing "Fabroil A" gears; 4591-A, containing illustrated details of instrument transformers (up to 11,000 V); 5120-B, dealing with field rheostats for generators and motors; and 5,130, describing field discharge resistances.

Drake & Gorham Wholesale, Ltd., 67, Long Acre, W.C.2.—A very comprehensive catalogue (84 pp.) of radio apparatus of all makes, including complete sets, components, and accessories. Each item is illustrated and priced. Also a leaflet (No. 421), dealing with "A.D." Leclanché cells for radio purposes.

Industrial Combustion Engineers, Ltd., Astor House, Aldwych, W.C.2.—Catalogue Nos. 1 to 4, dealing with "Bailey" boiler meters of various patterns. These meters are installed at Manchester (Barton), Birmingham, the L.C.C. Tramways power station, and other important supply undertakings.

The Mullard Wireless Service Co., Ltd., Nightingale Lane, Balham, S.W.12.—A coloured showcard depicting a number of musical fairies and advertising "Mullard" radio valves.

Messrs. W. E. Beardsall & Co., Ltd., 5, Victoria Bridge, Manchester.—A folder illustrating "Winter" interlocking switch plugs. Priced.

The Carpax Co., Ltd., 312, Deansgate, Manchester.—A leaflet describing the "Jasper" screw-on connector for small wires, together with a sample of the device.

Messrs. Clough, Smith & Co., Ltd., 36, Victoria Street, S.W.1.—A well-illustrated brochure, describing the "Straker-Clough" trolley omnibus as supplied to home and foreign tramway authorities.

Brittain's Electric Motor Co., 110, Cannon Street, E.C.4.—A detailed catalogue of the company's a.c. motors of various types and ratings. Illustrated and priced.

Messrs. W. H. Willcox & Co., Ltd., 38, Southwark Street, S.E.1.—Booklets containing particulars of the company's motor lubricants and oils and greases.

General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—A well-illustrated brochure describing the "Gecoray" system of shop-window lighting; a number of examples are depicted.

Metro-Vick Supplies, Ltd., Trafford Park, Manchester.—Special Publication No. 7130/1, a price list of "M.-V." shop-window lighting equipment, including real silver reflectors.

The Igranic Electric Co., Ltd., 149, Queen Victoria Street, E.C.4.—A series of pamphlets giving details, illustrations, and prices of various "Igranic" radio components and accessories, including coils, transformers, rheostats, condensers, valve-holders, &c.

The Rockwood Co., Ltd., 147, Queen Victoria Street, E.C.4.—A priced folder, illustrating and describing a number of small tools for radio construction—reamers, panel cutters, pliers, wrenches, &c.

Messrs. E. P. Allam & Co., 107-109, Gray's Inn Road, W.C.1.—October stock list of d.c. motors ranging from 1 to 38 h.p.

The Midland Electric Manufacturing Co., Ltd., Barford Street, Birmingham.—A booklet entitled "Switches and Standards," showing new designs of "M.E.M." switches which conform to the requirements of the I.E.E. Rules and Home Office and the Board of Trade regulations, and are made in accordance with the conditions laid down by the British Engineering Standards Association.

Messrs. Ferranti, Ltd., Hollinwood, Lancs.—Pamphlet Ta 710, describing a short-circuit test on a 1,200-kVA, 5,500/440-V standard core-type, three-phase transformer.

Philips Lamps, Ltd., 60, Wilson Street, Finsbury Square, E.C.2.—A pamphlet advertising the "Philips" Christmas tree lighting outfits.

Bankruptcy Proceedings.—H. A. Van Os and M. H. Van Os, trading as Van Os & Company, merchants, 56, Holborn Viaduct, E.C.—These bankrupts applied on October 20th to Mr. Registrar Mellor, at the London Bankruptcy Court for an order of discharge from bankruptcy proceedings instituted last February. Mr. V. Armstrong, Official Receiver, reported that the ranking liabilities amounted to £4,798 and the assets had only realised £2, but a further small sum was anticipated from book debts. The bankrupts took over a business previously carried on by their father. They attributed their failure to depreciation in the value of stock, liability for differences owing to accounts being closed against them, and lack of capital. In November, 1923, they registered a company with a capital of £500 to carry on business as general merchants and manufacturers of electrical lamps and accessories; they became directors of the company; H. A. Van Os was allotted 300 shares and M. H. Van Os 187 shares, but they were subsequently transferred to another person, and the bankrupts held only the qualifying shares. They were in receipt of remuneration at the rate of £125 per annum each, and a commission of 1½ per cent. on the total sales of the company. The discharge was opposed by the Official Receiver on the grounds of (1) insufficiency of assets to equal 10s. in the £ on the amount of the liabilities; and (2) trading with knowledge of insolvency. His Honour granted a discharge subject to judgment for £100, to be satisfied by an immediate cash payment.

A. A. Carr and G. S. Childe, dealers in radio accessories, 38, Park Row, Leeds, and 38, Victoria Road, Scarborough.—The public examination of these debtors was held at the London Bankruptcy Court on October 21st, before Mr. Registrar Hope. The failure occurred last February with liabilities of £555, against assets valued at £51. Replying to Mr. Walter Boyle, Senior Official Receiver, the debtor Carr stated that prior to 1922 he carried on business at Leeds as a stockbroker, but closed down in that year and commenced as an agent for the sale of radio accessories. In 1923 he was joined in partnership by Childe, who paid £750 for a half-share in the business, and subsequently provided a further £250. In November, 1923, they sold their business to Carr & Childe, Ltd., each of them receiving 250 fully-paid £1 shares, and they acted as directors until May, 1924. The failure was attributed to the commission earned having been insufficient to meet overhead expenses, lack of capital, and loss of business in consequence of the non-delivery of goods ordered from manufacturers. The debtor Childe confirmed the evidence given by his partner. The examination was concluded.

W. C. Rhodes, trading as L. J. Palmer & Co., 141, Newspaper House, Corporation Street, Birmingham, electrical engineer and contractor.—The first meeting of creditors was held on October 19th at the Official Receiver's office, Birmingham. The statement of affairs showed a deficiency of £621. Debtor attributed his failure to bad trade and liability in respect of the debts of a partnership. In May, 1923, he entered into partnership with another as electrical engineers, the joint capital amounting to £130, of which one-half represented the value of the stock and trade effects of the partner; the balance was cash contributed by the debtor, while they each provided a further £50. In 1923 the business was removed to Corporation Street, and a year later the partnership was dissolved. A balance sheet then prepared showed a deficiency of nearly £278, and debtor agreed to take over the business, and discharge the liabilities with the exception of a debt of £50 due to his partner's mother. The case being a summary one was left with the Official Receiver as trustee of the estate.

W. K. M. Wilson, 1, Mount Street, Heanor, Derbyshire, electrician and radio apparatus dealer.—The adjourned public examination of this debtor was held recently at the Court House, Derby. It appeared that the debtor commenced business in February, 1922, with £100 borrowed capital. This

business only lasted about a month. He then commenced at his residence, 1, Mount Street, Heanor. Debtor was supplied with faulty goods by manufacturers, and in consequence of this and of competition trade fell off. His liabilities were £373 against assets of £17. Debtor admitted that he kept no books of account. The examination was closed.

S. Purcell, electrical contractor, The Arcade, Goole.—Receiving order made October 20th on debtor's own petition.

J. Kingston (Cromwell Engineering Works), electrical and general engineer, 176, Romsey Road, Shirley, Southampton.—First and final dividend of 3s. 8¾d. in the £, payable at the Official Receiver's office, Midland Bank Chambers, High Street, Southampton.

B. Uttley, electrician, Tower Street, Bacup.—Receiving order made October 14th, on debtor's own petition.

W. R. Squire, electrical engineer, 11, Steward Street, Spring Hill, Birmingham.—First meeting October 29th, at the Official Receiver's offices, 191, Corporation Street, Birmingham. Public examination, December 2nd, at the Court House, Birmingham.

S. B. Weston (Westforrest Radio Co.), wireless apparatus manufacturer, Playhouse Arcade, High Street, Guildford.—Trustee, Mr. T. Gourlay, Official Receiver, 29, Russell Square, W.C., released October 7th.

Company Liquidations.—H. W. Smith & Co., Ltd., electrical wire and cable manufacturers, Lydbrook, Gloucestershire.—The statutory first meetings of the creditors and shareholders of this company were held on October 19th at Carey Street, W.C. Mr. J. Barwick Thompson, Official Receiver, reported that the winding-up order was made on April 7th last upon the petition of the Attorney-General, acting on behalf of the Board of Inland Revenue, creditors claiming £47,978. The company was registered in 1912, as a private company, with a nominal capital of 5,000 ordinary shares of £1 each, and was formed to acquire as a going concern the business of electrical wire and cable manufacturers, previously carried on by H. W. Smith and F. W. T. Brain, since 1906. The vendors were the promoters and acted as first directors. Mr. Brain resigned office in March, 1913, and was succeeded in the following August by Mrs. Smith. Under the purchase agreement, the company acquired the goodwill and the assets (with the exception of book debts) for a consideration of £2,530, payable as to £2,000 in shares and £530 in cash, and in addition undertook to discharge the business liabilities, which amounted to £1,137. Mr. H. W. Smith was appointed managing director and secretary at a salary of £250 per annum, plus a bonus on the annual profits; his salary was afterwards increased to £1,000 and later to £2,000 per annum, but no record of any such increase was to be found in the minute book of the company. The issued capital was £3,200, of which £2,000 was allotted to the vendors as fully paid and £1,200 was subscribed by them for cash. During the war the company carried on a very substantial and profitable business. Small losses were made in the first three years, but the subsequent accounts showed profits of £1,494 in 1915, £32,290 in 1916, £33,979 in 1917, and £36,334 in 1918. No proper accounts were kept for 1919, but a draft account showed a loss of £5,063. The company had secured contracts to supply wire and cables to various Governments during the war, and that explained the large profits made in those years; those profits were apparently used to extend the business by providing special plant and machinery and to enlarge the factory. After the war a number of the contracts were cancelled and the business came practically to a standstill. Early in 1920 arrangements were made for a reconstruction of the company and for the provision of finance for the purpose of resuscitating the business during the post-war period. That was to be carried out with the assistance of S. Smith & Sons (Motor Accessories), Ltd. Arrangements were made for the registration of a new company entitled W. H. Smith & Company (1920), Ltd., and for this company to go into voluntary liquidation. Leave was given to register a company with the new title on condition that the old company should go into voluntary liquidation, but apparently no steps had been taken to carry this into effect. The new company was registered on June 10th, 1920, and its original capital of £60,000 was subsequently increased to £75,000. It undertook to acquire the old company's business as from January 1st, 1920, for a consideration of £25,000, payable in 20,000 10 per cent. cumulative preference and 5,000 ordinary shares of £1 each. The book debts of the old company were not taken over but were to be collected by the new company and the proceeds applied to payment of the liabilities of the old company, the new company also undertaking to pay any balances remaining on the old debts. Mr. H. W. Smith was appointed managing director of the new company for five years at a salary running from £1,000 to £1,250 per annum. S. Smith & Sons (Motor Accessories), Ltd., subscribed cash for 25,000 shares and arranged to finance the company by means of a bank overdraft to the extent of £50,000. It was intended that the Smith's Motor Accessories Company should take a considerable quantity of the new company's output, and for a time it did so, but owing to the depression in the motor trade during 1920-21, it experienced trade difficulties itself, and had to reduce its requirements accordingly. The new company appeared to have experienced difficulties from the commencement owing to trade depression and the business was carried on at a loss. In February, 1921, debentures for £50,000 were issued to the bankers to secure the overdraft, and in the following September a Receiver was appointed who took possession of the assets and had since carried on the business. At the date of the transfer to the new company the old company was stated to be liable to the Inland Revenue as follows: Income tax, £6,662; Excess Profits Duty, £39,594; and interest thereon £1,722, a total of £47,978. The company was dissolved on February 9th, 1923, by notice in the *London Gazette*, and was struck off the Register of Joint Stock Companies. In the following December, however, it was restored to the Register on the petition of the Board of Inland Revenue, and that body, through the Attorney-General, presented the petition upon which the order to wind up the company was made last April. The accounts filed under the liquidation showed unsecured creditors for £36,662 and preferential claims of £9,049, whilst the only assets disclosed were £20,000 preference and £5,000 ordinary shares of H. W. Smith & Co. (1920), Ltd., together with a claim against that company for damages for breach of contract in failing to discharge the liabilities of the old company. The Receiver of the 1920 company had informed the Official Receiver that he was about to effect a sale of its assets at a sum which would be insufficient to discharge the debenture issue. It followed that no value whatever could be placed on the shares in the new company or the claim against that body, and there was no prospect whatever of any dividend being paid to either the creditors or shareholders of this company. The failure was attributed by Mr. H. W. Smith to the inability of the 1920 company to discharge the liabilities of the old company owing to general trade depression and heavy depreciation in the value of the stock. Mr. H. T. Marsh, who was appointed secretary on August 23rd, 1920, for the purpose of protecting the interests of S. Smith & Sons (Motor Accessories), Ltd., had expressed the opinion that the company spent much in excess of the large profits earned during the war period, in adding to the buildings, plant and machinery; that expenditure left no funds available with which to secure trade to remuneratively employ the plant and machinery. In the absence of a quorum the meetings were formally adjourned for a week, and the chairman intimated that the liquidation would then doubtless be left in the hands of the Official Receiver.

Morch Bros., Ltd., manufacturers of radio sets and accessories, 35, Tresham Avenue, Clapton, E.5.—The first meetings of the creditors and shareholders were held on October 22nd, at Carey Street, W.C. The winding up order was made last June upon a creditor's petition, and accounts have been submitted showing a total indebtedness of £1,323 and assets valued at £532, leaving a deficiency of £1,790 with regard to contributories, the issued capital being £1,000. Mr. E. T. A. Phillips, Official Receiver, reported that the company was promoted as a private company in December, 1924, with a nominal capital of £1,000, the promoter being Mr. J. J. Morch, who was appointed managing director at a salary of £400 per annum. The promoter and his brother had carried on business as motor engineers, and in the autumn of 1923 they commenced to manufacture wireless sets and accessories, for which purpose they installed the necessary plant. They were handicapped by lack of capital, and borrowed £350 on the understanding that a company should be formed and debentures created to secure the advances. The purchase consideration for the business was agreed at £2,525, payable as to £156 in cash, £1,000 in shares, and the balance by discharging the existing liabilities. The debentures, however, were not issued until March 9th, 1925, which date was within three months of the commencement of the liquidation, and as they were for a past consideration, the bonds were invalid. The chief business of the company was the manufacture of wireless sets and accessories for wholesalers and retailers; a contract was obtained for the supply of about £800 worth of such goods, but after about £300 worth had been supplied, the buyers refused to take delivery of the remainder and that caused a loss to the company. Execution having been levied in May, 1925, in respect of rates, the debenture holders appointed Mr. C. T. Payne as receiver on their behalf and liquidation proceedings followed. The failure was attributed by the company's officials to trade depression, and the illness of the managing director, but, in the opinion of the Official Receiver, the failure was due to the lack of working capital. Upon the making of the winding up order, the Official Receiver, on giving an undertaking to satisfy the execution debt, took possession of the assets and disposed of them by public auction, the sale realising £244 gross. The creditors passed a resolution for Mr. C. Latham, 70, New Oxford Street, W., to act as liquidator, but the shareholders declared in favour of the Official Receiver remaining in office and the chairman announced that the appointment would be made by the Registrar in due course.

Carter & Mitchell, Ltd., wholesale electrical and wireless suppliers, 24, Allsop Street, Upper Baker Street, N.W.—A meeting of creditors was held on October 22nd, at the offices of Mr. C. Latham, accountant to the Wireless & Radio Trades Guardian Association, 78, New Oxford Street, W. The chair was occupied by Mr. Latham, who said that when the creditors previously met it was reported that the liabilities were £1,236 against net assets of £406, leaving a deficiency of £829. The company was formed in July, 1923, with a nominal capital of £2,000, of which £1,000 had been issued. The creditors decided that Mr. Latham should be appointed as joint liquidator, and the shareholders had since passed a resolution appointing him to act as sole liquidator, as the gentleman originally appointed intimated that he wished to retire. Mr. Latham stated that there was a balance at the bank of only 3s., whilst the fixtures and fittings were estimated to realise £5. There were also book debts valued at £60; doubtful and bad debts, £25; and stock £5. The total assets were £95, from which had to be deducted £74. The Chairman added that there were cer-

tain other assets which were claimed by third persons, but their claims had not been admitted by him. With regard to the liabilities, the amount due to the trade was £816, and in addition there was a contingent liability for alleged breach of contract with a German company. That contingent liability was put down at £7,647. Unless anything unforeseen happened it was unlikely that the creditors would receive any dividend. The voluntary liquidation of the company is to be continued.

International Wireless Manufacturers, Ltd.—A petition for the winding up of this company has been presented to the High Court by Marconi's Wireless Telegraph Co., Ltd., of Marconi House, Strand, W.C., creditors, and will be heard in London on November 3rd.

Union Electric Welding Co., Ltd.—Winding up voluntarily. Meeting of creditors November 2nd, at 9, Billiter Square, E.C. Particulars of claims to the Liquidator, Mr. L. O. Huggins, 81, Cannon Street, E.C., by November 23rd.

Tredegars, Ltd. (old company).—A meeting of members is called for November 24th at the offices of Messrs. Tansley Witt and Co., 5, Chancery Lane, W.C., to hear an account of the winding up from the joint Liquidators, Messrs. N. Bell and B. B. McCallum.

Dissolutions of Partnership.—Midland Electric Co., electrical factors, 1, Charles Street, Leicester.—Mrs. J. A. Young, and Mr. F. A. Dunmore have dissolved partnership. Mrs. Young will attend to debts.

Hall & Heptonstall, motor and electrical engineers, Somerset Hotel Yard, and 13, Station Parade, Harrogate.—Mr. W. T. Heptonstall and Mr. W. R. Smith have dissolved partnership. Mr. Heptonstall will attend to debts and continue the business under the same style.

Onslow Engineering Co. (Williams & Robertson), mechanical and electrical engineers, 177, Fulham Road, South Kensington, S.W.—Mr. A. W. Williams and Mr. D. W. Robertson have dissolved partnership. Mr. Williams will attend to debts and continue the business under the style of Onslow Engineering Co. (A. W. Williams).

Empire Goods Propaganda by Tramcar.—During the recent Shopping Week at Walsall, the Corporation Tramway Department fitted up one of its cars to encourage the inhabi-

An Illuminated Tramcar at Walsall.

tants to buy Empire products. This car was particularly attractive at night, as the accompanying illustration shows.

Licensing Indian Electrical Contractors.—An amendment to the rules promulgated by the Government of Bombay for the licensing of wiremen and electrical contractors provides that a register of all electrical contractors and wiremen shall be maintained by the Electrical Engineer to the Government. The licences and certificates shall be renewable annually, failure to renew them will render them liable to cancellation, and the full fee for a fresh licence or certificate will be charged. The fee for such renewals shall be: Licence as electrical contractor, Rs. 10 per annum; Class I certificate of competency, Rs. 5 per annum; and Class II certificate of competency, Re. 1 per annum.

Licensing Contractors in New South Wales.—The *Sydney Evening News* reported recently that regulations for the licensing of electrical contractors as redrafted, had been forwarded to the Government. The proposal was that licences should be issued as from October 1st, and should remain in force for 12 months. On and after November 1st it will be illegal for any person to undertake electrical installation unless he is the holder of a licence or is employed by the holder of a licence who has contracted to carry out the work. Provided no further delay occurs on the part of the Government in gazetting the regulations, the Act should be in complete operation by November 1st.

Polish Contract for Czecho-Slovakia. — The Ceskomoravska-Kolben Co., of Prague, has recently secured a contract for the establishment of an electric power station in the town of Przemysl.

Swedish Apparatus Exports.—The *Swedish Economic Review* states that the exports of telegraph and telephone apparatus from Sweden during the period January-August, 1925, were valued at 4,475,000 kr., as compared with 4,809,000 kr. in the equivalent period of 1924.

Book Notices.—"The Confessions of a Capitalist," by Sir E. J. P. Benn, Bart. London: Hutchinson & Co. 18s. net. —We confess to a difficulty in writing about this book for there are so many things that we might say, if we had the space to spare, concerning both the author himself and what he says about himself. We began by wondering why it was written and what justification there could be for a comparatively young man in the midst of life's activities sitting down to write about so many trifles connected with his own unbringing, his schemes, failures, and successes. One recovers from this as one passes on through its very easily read chapters and gets accustomed to the free use of the first person singular. Really it is the kind of story that ten thousand other business men might have written about the difficulties of doing business nowadays, for we have all been in the same boat since the war. Those most likely to be interested in the parts of the book dealing with his business in trade journals, his few successes and his many losses, are trade journalists and newspaper proprietors who have walked contemporaneously with the author, since his father (upon whom the baronetcy was conferred toward the end of his life, for much public service), initiated him into this department of activity. How far the general reader is interested in such matters we do not pretend to know, but there is much that is entertaining and informative relating to the science and conduct of business and to the way in which private enterprise is penalised and throttled and trade and employment are hampered by the conditions which prevail to-day. That part of the story, and especially the account of some of the disastrous effects of heavy taxation, is well told and should be widely read. It tells of many things that the great majority of the people know nothing about, and it tells them in a straightforward and interesting way. But many of those who ought to read these things cannot afford the price of the book—not being capitalists themselves. Editors are sometimes asked to advise their readers candidly whether a certain book is one to buy or one to borrow. Those who are in a position to borrow will not need any guidance; others will probably buy it and then pass it on, pleasing the author by giving the widest circulation possible to his story.

The Autumn List of books published by Sir Isaac Pitman and Sons, Ltd., contains many titles, with brief descriptions, of books dealing with a wide variety of electrical subjects.

"The Activities of Vickers, Ltd.," is the title of a brochure published by the company named to inform the public of its many important works. Among the activities dealt with are the production of ordnance, the building of battleships and aeroplanes, the construction of motor bodies, gas engines, condensers, &c. The illustrations are numerous and effective.

"Tables and Graphs for Facilitating the Computation of Spectral Energy Distribution by Planck's Formula" (seven sheets, five charts).—Bureau of Standards. Washington: Government Printing Office. 35 cents.

"Science Abstracts A and B." Vol. XXVIII. Part 10. October 25th, 1925.—London: E. & F. N. Spon, Ltd. Price 3s. each.

German Radio Enterprise in Turkey.—The *Financial News* reports the formation of the Elektro-Radio Société Anonyme Turque in Constantinople, with a capital of £T300,000, to undertake the manufacture of electrical instruments, &c., and to carry on broadcasting and radio-telegraphy. German capital and enterprise have taken a large participation in the new concern, among the firms represented being the Siemens-Schuckertwerke, Siemens & Halske, the Telefunken Co., and the Dr. Eric F. Huth Gesellschaft.

New German Customs Tariff.—With the issue of the *Board of Trade Journal* dated October 15th was published a complete translation of the new German Customs tariff which was put into force on October 1st. The publication can be obtained from the Stationery Office at 6d. net.

New Australian Company.—Among the recently-formed Australian companies is Condor Lamp (Australasia), Ltd., with a capital of £25,000.

Hungarian Electrical Exports. — During the second quarter of the current year 8,224 quintals of electrical goods and apparatus was exported from Hungary. The principal customers were Italy (1,490 quintals) and Jugo-Slavia (1,152 quintals); the British share was too small for separate classification. Over half of the total was represented by machinery (generators, transformers, &c.).

Norwegian Transformers for Australia.—According to *Commerce Reports* the Norwegian A/S National Industri recently secured a contract for the supply of approximately 300,000 crowns' worth of transformers to Australia.

The Finnish Electrical Market.—*Commerce Reports* says that, generally speaking, Finland holds considerable promise of future development as a market for electrical wiring material, but its growth will necessarily be slow. The price factor in a country where money is comparatively scarce and the market limited is usually the deciding one. The material at present employed is predominantly of German make or at least of German design.

British Tenders for Budapest Scheme.—According to the Budapest newspapers, tenders for the supply of electric power for the city of Budapest have been received, not only from the Dutch-American group, but also from the Armstrong and Vickers groups. All these groups, it is added, declare their readiness to take over the foreign debts of the city of Budapest and promise reductions in the charges for the supply of power varying from 20 to 40 per cent. of the present rates.—*Reuter* (Budapest).

Proposed Russian Purchases Abroad.—The Supreme Council of National Economy of the United Soviet Socialist Republics announces that it is sending abroad, especially to Germany, France, England, and America, twelve commissions, representing various branches of industry, such as the electro-technical, oil and metal sections, invested with extensive powers to purchase equipment for the industries concerned, to a total amount of 270,000,000 roubles, subject to credit being granted up to three years.—*Reuter* (Moscow).

New Western Electric Showroom.—The Western Electric Co., Ltd., has recently opened a new showroom at Livery Street, Birmingham. The accompanying reproductions of photographs show the room to be well laid out, and the exhibits to be very representative of the company's products. Fig. 1 is a view of the section devoted to domestic electrical equipment, the principal objects being a vacuum cleaner, a washing machine, and an ironer, while a number of table

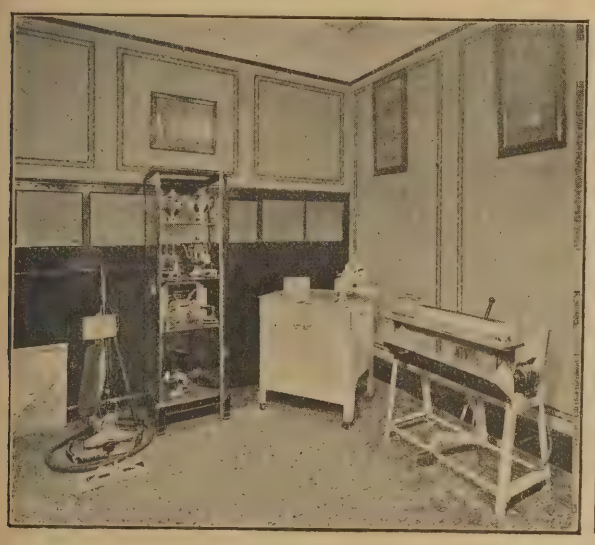

Fig. 1.—The Domestic Section.

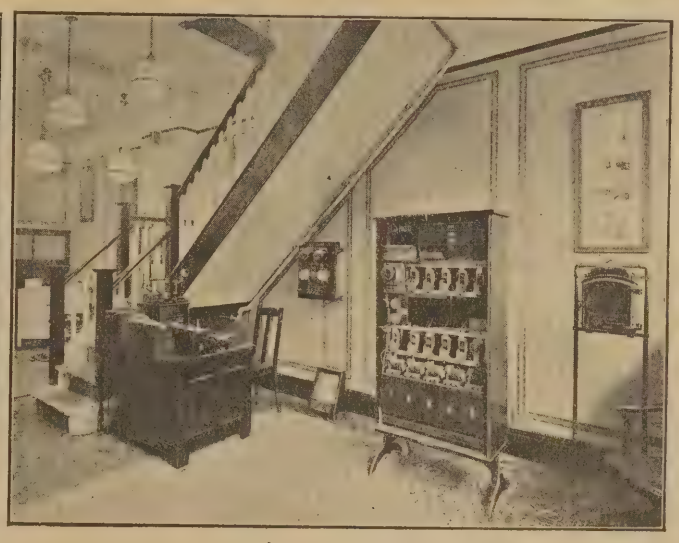

Fig. 2.—The Telephone Section.

Western Electric Showroom at Birmingham.

appliances and other electrical devices are housed in a show-case. The other view (fig. 2) is of the telephone section. This contains a great deal of intercommunication equipment, as well as radio-telephone sets and accessories, including "Igranic" devices. The new showroom is under the control of Mr. J. Entwistle, the company's Birmingham manager.

Argentine Crane Contract.—A contract for 129 electric cranes for the new harbour in Buenos Aires is reported to have been secured by a German firm at a price which was lower than the offers made by other German firms, and from 10 to 15 per cent. lower than the tender prices of English and American competitors.

Belgian Enterprise in Turkey. — Under the title of the Société Turque de Gaz et d'Electricité à Constantinople, a company has been formed in Brussels under the auspices of the Empain group to resume the gas concession in Stamboul and the gas and electricity concessions on the Asiatic side of Constantinople, as well as to undertake the establishment and working of other industrial undertakings in Turkey. The company whose statutes have been approved by presidential decree of the Government of Turkey, has an initial capital of £T1,000,000. Belgian electrical and financial companies are among the chief subscribers of the capital.

American General Electric Progress.—The president of the General Electric Co. (United States) recently announced that the value of the orders received by his company during the third quarter of the current year was $73,561,483—an increase of 26 per cent. when compared with the September quarter of 1924. For the first nine months of the year the total value of orders has been $223,876,711—an increase of 10 per cent. over the figure for January-September, 1924.

French Lamp Propaganda.—Ten French manufacturers of electric lamps have recently embarked on a joint publicity campaign urging the French public to "support French industry by buying only electric lamps which are really French."

New French Companies.—A new company has lately been formed at Wolfisheim, Lower Rhine Province, with a capital of 1,200,000 fr., and the title Le Société "Meti," Fabrique de Matériel Electrique, Téléphonique et Industriel.

La Société de Distribution Rurale d'Energie Electrique is the name of a new company which has lately been organised at Ruffec (Charente) with a capital of 350,000 fr.

The Embargo on Foreign Loans.—The Federation of British Industries has made representations to the Governor of the Court of the Bank of England urging upon him some relaxation in the present attitude of the Bank with regard to foreign loans issued in this country. At the present moment the policy of the Bank is said to constitute a virtual embargo upon such loans and to have a consequent adverse effect upon our export trade. In the past the large annual investment of British capital in oversea countries has played an important part in supporting and developing export trade. It is suggested that if the Bank of England cannot completely abandon the present embargo it should at least permit a partial relaxation in respect of loans of such a character that their proceeds would largely or wholly be expended immediately in this country in the purchase of British goods.

Unemployment.—There was a further decrease of 20,925 in the total of registered unemployed during the week ended October 19th, the number at that date being 1,237,900. This compares with about 1,204,000 at the equivalent period of last year.

Employment During September.—The October *Ministry of Labour Gazette* states that employment in the engineering industry during September continued bad on the whole, the general figure of unemployment being 11.6 per cent., a decrease of 0.2 per cent. as compared with August and 1.9 per cent. in comparison with September, 1924. In the electrical branch employment remained fairly good, the unemployment percentage being 5.7, a decrease of 0.2 per cent. as compared with August, although it was higher by 0.5 per cent. than in September, 1924. There were also slight decreases in unemployment in the electrical wiring and contracting industry and in electrical cable, wire and lamp manufacture.

New Municipal Showrooms and Offices.—The new Southport electricity showrooms at the Glaciarium, Lord Street, were recently opened. The administrative offices and showrooms are on the street frontage; the first and second floors are occupied entirely by offices for the technical and clerical staffs and a large room which is to be used as a lecture hall for the demonstration of electric cooking, washing, ironing and vacuum cleaning. This room is fitted with a large platform at one end, and is set out as a model kitchen. The body of the lecture hill is fitted with tip-up seats for about 50 persons, although the room will comfortably accommodate 100 persons at any one time. As in the showrooms, the whole of the ceiling is fitted with special adaptors for the easy fixing of all classes of lighting fittings. The skirting boards round the room have been fitted with numerous sockets for supplying current to all classes of electric appliances which are exhibited and demonstrated in this room. Appliances bought from the showrooms and valued at £3 or over can be obtained on the hire-purchase system. In the windows the latest systems of concealed lighting are employed. The showrooms include a model electrically-equipped house. The kitchen contains electric ovens, complete with grills and boiling plates. There is also a thermostatically controlled heating cistern over the sink. In the dining room there is a "Magicoal" electrical fire. In this room are displayed the latest styles of illumination, toasters, plate warmers and tea infusers.

The Electricity Committee of the Paisley Town Council is to erect buildings in Moss Street at a cost of £5,500 for electricity offices, a showroom, and meter shop.

New Belgian Company.—La Société d'Electricité de la Région de Malmedy is the name of a new company which has lately been formed in Brussels with a capital of 40 million francs.

New Swiss Company.—A new company has lately been formed at Lessoc, Canton of Fribourg, with the title Le Société Electro-Métallurgique Procédés R. Neveu, to acquire and exploit the Neveu electro-metallurgical patents.

For Sale.—By direction of the Air Ministry, Messrs. Horne & Co. will sell by auction on November 9th and the following days, at the Air Ministry Works and Buildings Stores Depôt, Watford, machinery, machine tools, generating and wireless plant and stores. Rawtenstall Corporation electricity department has for disposal surplus generating plant, &c. (See our advertisement pages to-day.)

Local Exhibitions.—An exhibition promoted by Paisley Corporation Electricity Department, in conjunction with local electrical contractors, was formally opened at the Town Hall, Paisley, on October 20th. This was the third venture of its kind to be held in the town. The Electricity Committee organised the display, and the following companies exhibited: The General Electric Co., Ltd.; Metro-Vick Supplies, Ltd.; Messrs. Kennedy, Stark & Co.; and Messrs. J. Kilpatrick and Son, Ltd.

Leeds.—A "Better Homes" Exhibition, organised by the *Leeds Mercury*, was held last week at the Fenton Street Drill Hall, Leeds. It included electric labour-saving appliances for domestic use. The exhibition was opened by the Lord Mayor and Lady Mayoress of Leeds, and there were some 60 exhibitors.

Wakefield.—Under the auspices of the Wakefield Corporation Electricity Department, an all-electrical exhibition, open to the public free, was held at the Bank Street Drill Hall, from October 19th to 24th. The exhibition was opened by the Mayor, and included the most modern applications of electricity for heating and cooking, with working examples of domestic appliances, especially washing, ironing and sewing machines. Electric cooking demonstrations were given daily, and for the benefit of local textile traders an electrically-driven "Dobcross" loom was running. The exhibitors were the Wakefield Corporation; the British Electric Transformer Co., Ltd.; the English Electric Co., Ltd.; Credenda Conduits, Ltd.; J. E. Fowler, Wakefield; the Hotpoint Electrical Appliances Co., Ltd.; the Hurley Machine Co.; Hutchinson, Hollingworth & Co., Ltd.; the Jackson Electric Stove Co., Ltd.; Walter Robb, Ltd., Wakefield; the Siemens & English Electric Lamp Co., Ltd.; and Singer's Sewing Machine Co., Ltd. Loan apparatus on the Corporation stand included appliances from W. E. Beardsall & Co., Ltd., Berry's Electric, Ltd., the Electrical Apparatus Co., Ltd., the English Electric Co., Ltd., Geo. Nobbs, Ltd., the Morgan Crucible Co., Ltd., Premier Electric Heaters, Ltd., and Young, Osmond & Young, Ltd.

New Austrian Company.—It is reported from Vienna that a new company is being organised under the name of the British-Austrian Metal Corporation, Ltd., to supply an Austrian syndicate with copper and to engage in the sale of cables, copper wire, &c.

German Foreign Electrical Loan.—The Berlin Stadtische Elekrizitatswerke Gesellschaft is reported to have arranged a 7 per cent. loan of £1,200,000 with a Swiss-Dutch syndicate to enable it to carry out further extensions. The interest on the loan, which is to run for a period of fifteen years, is being guaranteed by the Berlin Municipal Council.

Radio Transformer Price Reduction.—The Marconiphone Co., Ltd., informs us that it intends to reduce the prices of its "Ideal" radio transformers on November 1st.

The German Porcelain Insulator Industry.—According to a report just to hand, German manufacturers of porcelain for high-pressure insulation purposes are at present busily employed both on home and foreign orders. It is stated that several concerns now require long periods for delivery, while prices are stated to be satisfactory. On the other hand, makers of similar material for low-pressure insulation purposes are suffering from severe price competition. This is due partly to Czecho-Slovakian competition and partly to the fact that during the period of money inflation, the productive capacity was increased to an abnormal extent.

Lighting and Power Notes.

Aberdeen.—Year's Working.—The report on the working of the City Council's electricity undertaking (engineer: Mr. J. A. Bell) for the year ended July 31st last records a total income of £198,502, as compared with £187,874 in the preceding year. Operating expenses increased from £95,048 to £106,005, leaving a gross profit of £92,497 (£92,826). After deducting capital charges there remained a net surplus of £23,357, as against a surplus of £19,225 in 1923-24. The amount spent on capital account during the year amounted to £103,726, the chief items being £44,866 for machinery and £43,823 for mains and services. The electrical energy sold increased from 24,019,143 to 26,458,959 kWh. A 10,000-kW turbo-generator was put into commission during the year, and sanction was received to the installation of an additional set of a similar capacity. The number of heating and cooking appliances let out on hire increased by 666, making a total of 5,163.

Ashton-under-Lyne.—Extension of Supply.—The extension of the Corporation's electricity supply to the Hurst and Limehurst area was recently formally inaugurated. Electricity is transmitted from the generating station to a sub-station in Mossley Road at a pressure of 6,000 V a.c., where it is reduced to 3,000 V for distribution to various transformer pillars, which again reduce it to 240 V for lighting and 480 V for power.

Australia.—Sydney.—*Year's Working.*—The report on the working of the City Council's electricity undertaking (engineer: Mr. H. R. Forbes Mackay) for the year 1924 shows a total income of £1,611,767, as compared with £1,352,819 in the preceding year. Working expenses were £841,828, as against £740,893, leaving a gross profit of £769,939 (£611,926). Capital and other charges increased from £518,164 to £562,668, and there was a net surplus of £207,271, as compared with £93,762 in 1923. The capital expenditure during the year amounted to £739,730, and included £219,680 for machinery and plant at the power station, £90,311 for sub-station plant, and £244,077 for underground and overhead mains. The electrical energy generated amounted to 199,645,000 kWh, and 21,865,418 kWh was purchased from the Railway and Tramways Department. The sales of electrical energy amounted to 188,425,931 kWh, an increase of 30,729,175, or 19.49 per cent., and the average price obtained increased from 1.929d. to 1.946d. The maximum supply demanded rose from 51,290 to 60,080 kW. The new generating plant added during the year comprised two turbo-alternators, one of 17,500 kW, and one of 12,000 kW, bringing the capacity of the plant at the Pyrmont station up to 75,000 kW. Two new boiler houses were completed and three additional boilers, together with coal and ash handling plant, were put into operation. Totals of 23 miles of feeder cables, 168 miles of l.p. mains, and 55 miles of street lighting mains were put into service during the year.

Barnsley.—Loan.—The Town Council has received sanction to a loan of £5,230 for mains in the added areas of supply.

Bedford.—Loans.—The Corporation has received sanction to loans of £5,000 for sub-station equipment; £4,000 for buildings; £12,000 for plant at the generating station; and £15,000 for mains, transformers, and switchgear. Application is being made for sanction to the borrowing of £1,000 for a water purifier, £5,000 for meters, and £3,000 for domestic apparatus to be let out on hire.

Brandon (Co. Durham).—Loan.—The Urban District Council has decided to install prepayment meters in the Council houses at an estimated cost of £1,137, and is applying for sanction to the borrowing of this amount.

Calne.—Electricity Supply.—At the October meeting of the Town Council, the Gas Committee reported having considered the question of an electricity supply, and stated that the business streets of the town had been canvassed with encouraging results, and that that portion of the scheme could be carried out at a capital cost of from £2,500 to £3,000. The Council decided to invite tenders for the work.

Canada.—Hydro-Electric Development.—The North Shore Power Company, a subsidiary of the Shawinigan Water and Power Company, is now completing the harnessing of 20,000 h.p. at the Cheminée Falls, on the Batiscan River. This power will be available very shortly, and is derived from waterfalls which were leased from the Quebec Government.

The additions to the plant of the British Columbia Electric Railway Company at Stave Lake, which have been in hand for the past two years, have been completed. The power now available from that source amounts to 87,500 h.p. The additions have cost approximately $3,720,000. Announcement has recently been made by the president of the company that plans are completed to start immediate development of a power scheme on Bridge River, 135 miles north of Vancouver, on the Pacific Great Eastern Railway. The installation of the first sets, to cost $13,000,000 and to provide 60,000 h.p., will be started at once and should be completed in five years. Later the plant will be increased by an additional 70,000 h.p., at an expenditure of $30,000,000, the work to be spread over 15 years.

Continental. — Belgium. — Seventeen electricity supply undertakings are now associated with the Société de l'Union des Centrales Electriques, the object of which is to link up the various power stations in Belgium. The total power of the 21 power plants now interlinked is 112,500 kW. A considerable amount of the energy is generated by means of internal-combustion engines run by the waste gases from the blast furnaces in the district, and it is estimated that by this means a saving of 53,000 tons of coal was effected during the past year.

France. — A concession has lately been secured by the Société des Forces Electriques de la Vallée de Gavarnie to establishe a plant to utilise certain falls on the River Gavarnie, near Luz, in the Upper Pyrenees, for the generating of electricity. It is estimated that 34,500 kW is available.

Dunfermline.—Electricity in Small Houses.—The Corporation Housing Committee, having considered the respective costs of gas and electricity for lighting in connection with its housing scheme, has recommended the installation of electric lighting, and at the last meeting of the Town Council the recommendation was agreed to.

Eston.—Loan.—The Urban District Council is applying for sanction to a loan of £14,000 for electricity extensions.

Garw.—Inauguration of Supply.—The Urban District Council's electricity supply was recently formally inaugurated. Electricity is obtained in bulk from the South Wales Power Co., at a pressure of 11,000 V.

India.—Poona.—In order to meet the demand for additional electricity supplies in its area, the Poona Electric Supply Co. is to install two 600-b.h.p. Tosi engines direct-coupled to 400-kW generators. A new power house to accommodate the additional plant is nearing completion.—*Indian Textile Journal.*

Keighley.—Extension of Supply.—The Town Council is to apply for authority to supply electricity in the districts of Silsden, Cowling, Farnhill, Glusburn and Kildwick. Application is also being made for sanction to a loan of £50,000 for mains and services. The application of the Electrical Distribution of Yorkshire, Ltd., for a Special Order to supply in the districts above named is to be opposed.

Liverpool.—"All-Electric" Houses.—The Corporation Housing Committee is erecting 250 "all-electric" houses.

London.—Hammersmith.—*Year's Working.*—The accounts of the Borough Council's electricity undertaking (engineer: Mr. F. Hill) for the year ended March 31st last show a revenue of £193,726, as compared with £179,135 in 1923-24. Working expenses amounted to £112,984, as against £99,640, leaving a gross profit of £80,741 (£79,494), to which was added income from other sources making a total of £81,843. Capital and other charges absorbed £65,584, and there was a net surplus of £16,258, as compared with £15,434 in the preceding year. Out of the accumulated profits a contribution of £15,080 was made to the borough fund. The capital expenditure during the year amounted to £23,444, of which £17,091 was spent on mains' extensions, services, meters, and transformers. The sales of electrical energy increased from 20,126,879 to 24,485,903 kWh, and the average price obtained fell from 2.136d. to 1.898d. The maximum load rose from 12,440 to 13,200 kVA.

Stoke Newington.—The Electricity Committee has recommended to the Borough Council that the following revised terms for a bulk supply of electricity from the North Metropolitan Electric Power Supply Co. be accepted:—£5 per kW per annum, with a "unit" charge of ½d. for the first 250,000 kWh, and .4d. for all energy in excess of this amount.

Hornsey.—The Borough Council has received sanction to a loan of £23,850 for the installation of a 3,000-kW set.

Lowestoft.—Loan Sanctioned.—The Electricity Committee has obtained sanction to borrow £3,300 for the provision of a new feeder cable to Oulton Broad.

Luton.—Loans.—The Corporation is applying for sanction to loans of £10,000 for mains and £300 for switchgear. Sanction has been received to the borrowing of £2,000 for the provision of automatic stokers.

Newhaven.—Special Order.—The Brighton Town Council is applying for a Special Order to supply electricity to Telscombe Cliffs, in the area of the Rural District Council. The main is to be extended from the Rottingdean boundary to the main sewer outfall at Portobello, for the purpose of supplying electricity for operating pumping plant which is to be put down there. A sub-station is to be erected, and provision made for supplying electricity to premises when the Telscombe Cliffe Estate is developed. The maximum charges proposed are 9d. per kWh for lighting and 3d. per kWh for power.

Northern Ireland.—Whitehead (Co. Antrim).—A Lighting Committee has recently been formed to consider a proposal to introduce electricity for public lighting.

Londonderry.—In order to utilise the spare generating plant and electricity supply available owing to the closing down of the local shipyard, the city electrical engineer proposes the adoption of a combined (alternative) lighting, heating, and cooking rate for private houses. In this way it is hoped to secure a substantial increase of revenue without involving any additional expenditure for services or meters.

Preesall.—Loan.—At a recent meeting of the Town Council a communication was received from the Electricity Commissioners regarding the Council's application for sanction to borrow £14,000. The application was granted in respect of mains, but further information was required regarding services and transformers.

Portsmouth.—Loan Sanctioned.—The Town Council has received sanction to a loan of £11,000 for the erection and equipment of a sub-station at Fratton in connection with the supply of electricity to the tramway.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Buxton.—Lighting: Flat rate—Varying from 6½d. to 5d. per kWh, according to the quantity consumed. Two part tariff—From dusk to midnight, rates as above; remainder of the day 3½d. per kWh. Heating and cooking: Varying from 2d. to 1½d. per kWh according to quantity consumed. All charges subject to a discount of 2½ per cent. for prompt payment.

South Shields.—Rateable value system: For the winter quarters, 6d. per kWh for 3 kWh per £ of rateable value, and for the summer quarters, 6d. per kWh for one kWh per £ of rateable value. All energy in excess of these amounts 1d. per kWh.

Sheffield.—Loans Sanctioned.—The Electricity Committee has sanctioned loans of £1,403 for sub-stations in Cavendish Avenue, Rashley Road, and Mickley Lane, and £13,162 for the extension of mains to the Manor Housing Estate.

Seaham Harbour.—Proposed Electricity Scheme.—The Urban District Council has received a report from its consulting engineer on the proposed electricity scheme for the district. It is proposed to take a supply from the County of Durham Electric Supply Co., which has a 20,000-V supply at Stoney Cut sub-station, near Seaham Harbour. The cost of the scheme would be £16,600, and the estimated charge to consumers 7d. per kWh for lighting and 3d. and 3½d. for power. The Council is applying for a Special Order authorising it to distribute electricity in its area.

Skegness.—Proposed Electricity Scheme.—At the next meeting of the Town Council the question of installing electricity generating plant is to be considered.

Southport.—Purchase of Domestic Appliances.—The Corporation is applying for sanction to a loan of £5,000 for the purchase of electrical domestic appliances to be let out on hire.

South Warwickshire.—Special Order.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Leamington & Warwick Electrical Co., Ltd., to supply electricity in the rural districts of Southam, Stratford-on-Avon, and Warwick.

United States.—Hydro-Electric Development.—According to *Power*, the Mt. Shasta Power Corporation has applied for a licence covering Pit No. 4 site on Pit River, near Reading, California. The power is to be sold to the Pacific Gas and Electric Co. The development will make available 56,880 h.p. primarily. It is proposed to install three 40,000-h.p. generators.

A water-power enterprise is contemplated in two applications filed in Oklahoma City for permits to dam the Grand River in eastern Oklahoma. They are the Oklahoma Hydraulic Co. and the People's Public Service Corporation. Plans call for the erection of three dams. One below Miami would be 155 ft. high. It is stated that 275,000 h.p. would be developed.

The Carolina Power Co., of Sanford, N.C., is to erect a hydro-electric plant of about 40,000 h.p. Construction will start within the next few months.

Walsall.—Loan.—The Electric Supply Committee has decided to apply to the Electricity Commissioners for sanction to borrow £30,000 for extensions of electricity mains.

Tramway and Railway Notes.

Aberdeen.—Tramway Extensions.—The Corporation is to borrow £125,000 for tramway extensions. £2,500 is required for the electrical equipment of depôts.

Blackpool.—Year's Working.—The report of the manager of the Corporation tramway undertaking (Mr. C. Furness) for the year ended March 31st last shows a revenue of £272,420, and a working expenditure of £196,162, leaving a gross profit of £76,258. The figures for the previous year were: Revenue, £273,657; working expenses, £184,021; gross profit, £89,636. A deficiency of £165 on the motor-omnibus service was deducted from the surplus, and to it was added bank interest of £3,663 and a contribution of £83 from Lytham-St. Annes Corporation in respect of capital outlay at Adelaide Place terminus, making a total of £79,839 available. Capital charges, &c., absorbed £38,018, and the result was thus a net surplus of £41,820, as compared with £53,093 in 1923-24. This was added to a balance of £43,621 from the previous year, making £85,442. Sinking fund contributions amounted to £21,590, £15,000 was devoted to the borough fund, £25,621 transferred to renewal and reserve funds, and a balance of £23,230 was carried forward. The capital expenditure, which included £41,602 for permanent way, amounted to £52,419. The car-mileage increased from 2,605,269 to 2,691,698, and the passengers carried from 37,981,507 to 40,943,713.

Glasgow.—New Route.—The Tramways Committee has approved proposals for laying a tramway track on the Anniesland-Duntocher road.

Leeds.—New Route.—It was reported at a recent meeting of the Tramways Commitee that the new tramway to Middleton is nearly complete, and is expected to be available for service before the end of November.

Depot Extension.—The committee has decided to enlarge the central tramway depôt in Swinegate. The present accommodation is for 55 cars, and it is proposed to extend it to accommodate 200 cars.

London.—Old Street Station.—Escalators having been put into commission at Old Street underground station, the work on the dismantling of the lifts and the construction of

the new booking hall is to be commenced. The hall will have a circulating area of 2,050 sq. ft., and the work is expected to be finished early next year.

Through-Running.—The Highways Committee of the London County Council has recommended that an agreement be entered into with the Walthamstow Urban District Council for the through-running of tramcars between Liverpool Street and Chingford Mount.

Tramway Extension.—In connection with the extension of the tramway from Southend Village to Grove Park, the L.C.C. Highways Committee has recommended the expenditure of £33,875 for the extension of the tramway track from Bromley Road to connect with the portion at Downham, and £30,095 for the provision of electrical equipment, feeder pillars, duct-work, &c.

Newcastle-on-Tyne.—Purchase of Undertaking.—The Corporation Transport and Electricity Committee is considering the question of purchasing the undertaking of the Tyneside Tramways and Tramroads Co., with a view to amalgamating it with the city system. If agreement is is reached between the Corporation and the company, it is expected that Parliamentary powers will be sought in the Bill which is at present being promoted.

Sheffield.—New Cars.—The Corporation Tramways Committee is to introduce fifty new tramcars on its system.

Stockton-on-Tees.—Tramway Improvements.—The Joint Tramways Committee has instructed the tramways manager, in conjunction with the borough engineer of Thornaby, to prepare for submission to the next meeting of the committee an estimate of the cost of the proposed doubling of the tramway track in Middlesbrough Road.

Swansea.—Transport Scheme.—The Corporation Tramways Committee has considered three schemes, submitted by the borough electrical engineer, for carrying passengers to the Townhill estate, together with approximate estimates of costs, as folows:—A double track of tramways at a cost, exclusive of cars, of £27,000; cable tramway consisting of two cars driven by an electric motor on the top of the hill at a cost including cars of £24,000; a "Never-Stop" railway at a cost of £20,000. The committee has recommended the installation of a funicular railway, and has asked the borough engineer and the electrical engineer to prepare an estimate of the cost.

York.—"One-Man" Cars.—The Corporation Tramways Committee is experimenting with a "one-man" tramcar designed the city tramway engineer, Mr. J. A. Bromley, in collaboration with the English Electric Co., Ltd. The car is of the single-deck type, carrying 24 passengers, and if proved successful others of the same design are to be constructed.

Telegraph and Telephone Notes.

Canada.—Telephone Service.—It is stated that Canada has 1,009,203 telephones, or 11 for each 100 of her population.

Germany.—Electrophone Service.—The electrophone service which enables ordinary telephone subscribers to listen in their homes to operatic performances has recently experienced considerable technical improvement by the introduction of more efficient microphones in several towns. Hitherto the microphones used for this purpose were of the carbon granule type, and the new microphones with permanent magnets not only transmit with a high degree of purity and uniformity, but considerably reduce the number which it is necessary to use. The new microphones are only hand-size, and their application at the Frankfort Opera House has led, says *The Times*, to satisfactory results. The best results have been obtained by placing one microphone to the right and one to the left of the footlights, two more being placed to the right and left of the conductor. The performances are transmitted over the telephone wires to the Central Telephone Office, which passes them on to the telephone subscribers after amplification.

Railway Telephones.—Automatic System.—The new telephone exchange installed in the Southern Railway's general offices at Waterloo Station is now ready, and from Sunday department will speak to department and station to station by automatic telephony. The automatic system will enable an official at his desk at Waterloo to get 805 London depôts, stations, offices, or outposts without the intervention of any operator. The total cost of the inner London telephone scheme just carried out to the designs of the company's signal and telegraph superintendent, Mr. W. J. Thorrowgood, is £40,000.

Jutland.—Telephone Loan.—The Jutland Telephone Co. has accepted Hambros Bank's offer of a loan of £20,000 sterling at 5½ per cent., guaranteed by the Danish State.

Ships' Radio.—New Installations.—Six vessels owned by the Companhia Nacional de Navegacao Costeira, of Rio de Janeiro, are to be equipped by the Marconi International Marine Communication Co., Ltd., with wireless installations. The equipment for each ship will comprise a 1½-kW quenched-spark transmitter, a 1½-kW continuous-wave valve transmitter, valve receivers for spark and continuous-wave reception, a direction finder, and a broadcast receiver of the marine V4 type designed especially for ships. Loud-speakers operated by the broadcast receiver are to be installed in the music and smoking rooms of each ship. The receiving apparatus includes a four-electrode valve amplifier, and covers the wave-lengths of all the transmitting stations in commercial use. The direction-finding installations will use the new fixed-frame aerial, which obviates the use of posts or jumper stays, and effects a great saving both in space occupied and in cost. In addition to the five broadcast receivers mentioned above, the Companhia Nacional de Navegacao Costeira has purchased from the Marconi International Marine Communication Co., Ltd., twelve more such sets for installation on other ships of its fleet. Orders have also been received from Messrs. Elders and Fyffes, Ltd., for six new vessels to be installed with Marconi 1½-kW installations and fixed-frame direction finders.

Telegraph Conference.—Changes in Rates.—The plenary meeting of the International Telegraph Conference adopted, on October 24th, the increases in telegraph charges recommended by its Tariffs Committee. While the maximum terminal and transit rates chargeable are thus increased to keep pace with the increased working costs, no country is obliged to raise its rates; in practice, rates generally will not be raised except probably in the case of Germany, whose State telegraph systems are working at a loss. Great Britain has come to an arrangement with all European countries that there shall be no increase in the rates to and from Great Britain, except in traffic with France and Germany and in the case of these countries it is not certain that the increases will fall entirely on the public. The foregoing only refers to Intra-European traffic. As regards extra-European traffic, a slight increase in the maximum terminal charges at the European end is authorised, but the rates payable by the public will not be increased, the increases, if imposed by the Governments, being absorbed by the cable companies. The intra-European increases will come into force on April 1st, 1926.—*Reuter* (Paris).

Codes.—The plenary meeting of the International Telegraph Conference on October 21st decided to make no changes at present in the code language, but appointed a committee to report on the subject by next October. This means that the present rules as regards code cipher will remain in force until the next International Telegraph Conference some three years hence.—*Reuter* (Paris).

Telephony in Europe.—Projected New Main Cables.—It is stated that Mr. Jeremiah Smith, League of Nations Commissioner-General for Hungary, has given his consent to the construction of the Hungarian section of the long-distance telephone cable between Budapest and Vienna which the Austrian and Hungarian Governments recently agreed to lay down. The cable will contain 96 wires, as compared with the seven overhead telephone wires at present available, and will give Hungary direct telephone communication with the Western countries of Europe. The work is to be completed by the middle of 1927. The Government has also entered into communication with the Czecho-Slovakian and Yugo-Slav Governments with a view to getting Prague connected up with this great trunk line by a branch through Pressburg (Bratislava) and Belgrade by a branch to be extended eventually to Constantinople.—*Reuter* (Budapest).

Radio Notes.

Daventry.—A Mishap.—The cause of the 12 minutes' interruption in the operation of the B.B. Co.'s high-power station (5 XX) on the 23rd inst. was the presence of an infant mouse between the plates of one of the main condensers.

Experimental Transmission. — Cessation. — The experimental transmission which the B.B.C. has been in the habit of carrying out from one or other of its stations at night after the remainder of the stations have closed down, in order to allow those listeners who wished to do so to hear a distant station without any possibility of interference by near-by stations, was carried out for the last time on October 26th from the Bournemouth station. Such transmission from the "short-wave" stations has been abandoned for the present.

Egypt.—Radio Union.—It is reported that a Union has been formed of Greek enthusiasts with the object, amongst others, of establishing a low-power radio-telephone broadcasting station at Alexandria. Government permission will have to be obtained before the installation can be carried out.

Irish Free State.—Dublin Station.—The first radio broadcasting station in the Free State, which it is hoped will be in operation within the next two months, will be on the outskirts of Dublin. The International Wireless Bureau at Geneva has not yet fixed the wave-length to be used, but its power will be 1½ kW. A second station will be built later at Cork, the main function of which will be the relaying on low-power of the Dublin programmes, although there will be a small studio at Cork also; a landline is being laid between the two stations. The service will be controlled by the Post Office and financed by licence fees; in fact, as the *Evening News* points out, for the past three years owners of receiving sets in the Irish Free State have paid one guinea a year for the privilege of hearing Belfast and other B.B.C. stations. About £10,000 has been collected thus each year, all of which has been absorbed by the post and telegraph department of the Free State Government.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Aldershot. — November 3rd. Electricity Department. 1,500 yd. paper-insulated, lead-covered armoured l.p. cable. (October 23rd.)

Australia.—Sydney.—November 30th. Public Works Department. Metering equipment for the Barren Jack hydro-electric development scheme and the Kiama-Nowra transmission line.*

Melbourne.—December 14th. Electricity Commission of Victoria. 22,000-V insulators. (October 16th.)

Barking.—January 1st. County of London Electric Supply Co., Ltd. Water-tube boilers with mechanical stokers or water-tube boilers with powdered fuel equipment; steam turbo-alternators, condensing plant, and auxiliary apparatus for the Barking power station. (See this issue.)

Belgium.—November 4th. Belgian State Railway authorities (Office de l'Electricité), 25, Rue de la Charité, Brussels. Supply and laying of three lots of underground cables at respectively Bruges, Ypres, and Meirelbeke. Particulars (Cahier des Charges, Special No. 4-536) for 11 fr. 20 c.

November 4th. Belgian Post and Telegraph authorities at La Salle Madeleine, Brussels. Supply and laying of telegraph-telephone or loaded telephone cables between (1) Brussels and Lille, (2) Brussels and La Panne, (3) Brussels and Roosendael, and (4) Brussels and the German frontier at Hergenrath. Particulars (Cahier des Charges Special No. 3-144) for 9½ fr.

Bradford.—November 14th. Tramways Committee. General stores required during year commencing January 1st, 1926. Particulars from Mr. R. H. Wilkinson, general manager, 7, Hall Ings, Bradford.

Carlisle.—November 19th. Electricity Department. L.p. cast-iron piping for condensing water system. (See this issue.)

Dublin.—November 12th. Great Northern Railway (Ireland). Stores for six months (including electrical fittings, lamps, cable, and wire, &c.). (October 23rd.)

Erith.—November 6th. Electricity Department. 100 house-service prepayment meters. (October 23rd.)

Huddersfield.—Electric lighting installation at new premises at 74, Trinity Street. Particulars from Dr. Heanratty, 32, New North Road.

India.—Bombay.—November 11th. Bombay, Baroda and Central India Railway. D.c. motors and starting pillars. (See this issue.)

Kingston-upon-Hull.—November 16th. Electricity Department. Two natural draught cooling towers. (See this issue.)

London.—H.M. Office of Works.—November 3rd. Installation of cables, switchboards, &c., and wiring at the Ministry of Pensions Hospital, Orpington. (October 16th.)

November 4th. Electric wiring in conduit at Montagu House. (October 16th.)

Metropolitan Asylums Board. November 4th. Installation of two new hydro extractors at the Western Fever Hospital, Seagrave Road, S.W.; installation of hot-water heating apparatus at St. Anne's Home, Herne Bay; and installation of automatic telephones at the Downs Hospital for Children, Sutton, Surrey. (October 16th.)

Paddington.—November 3rd. Great Western Railway. Telegraph instruments, electrical apparatus, &c., telegraph ironwork and tools, telegraph drysalterers. November 20th. Electrical wires and cables. (October 16th.)

London County Council.—November 2nd. Wiring and fittings for electric lighting at the New Road elementary school, Clapham, S.W. (181 wiring points controlled by 168 switches). (October 23rd.)

November 16th. Reconstruction of electrical switchgear at Shoreditch sub-station. (See this issue.)

Shoreditch.—The Borough Council Electricity Committee will shortly invite tenders for a 10,000-kW turbo-alternator and 50,000-lb. boiler.

Manchester.—November 6th. Electricity Committee. One 500-kW fully automatic motor or rotary converter, transformers, switchgear, &c. Three 500-kW fully automatic motor or rotary converters or mercury-vapour rectifiers, transformers, switchgear, &c. (October 16th.)

New Zealand.—Hastings.—February 1st. Borough Council. Diesel engine and a.c. generator.*

Wellington.—December 15th. Post Office Stores Department. Key switches.*

Oldham.—November 21st. Electricity Department. Three 12,500-kW turbo-generators and auxiliary plant. (See this issue.)

Southampton.—November 2nd. Harbour Board. Alterations to the electrical equipment of 12 cranes, supply of cables, disconnecting boxes, and switchgear. Specifications from Mr. W. G. Gubbins, clerk, Harbour Offices.

Uruguay.—Montevideo.—January 7th, 1926. State Electricity Supply Works. 26,000 kilograms of copper wires and cables.*

January 5th. Bare copper wire, quicksilver.*
January 8th. Black and G.I. wire, &c.*
January 11th. 96,000 metres lead-covered wires and cables.*
January 12th. 44,500 metallic and carbon-filament lamps.*
Administration Nacional del Puerto de Montevideo. January 2nd. Machine tools and equipment.*

West Ham.—November 16th. Education Committee. Installation of electric lighting and central heating at the Cumberland Road new secondary school. (October 23rd.)

York.—November 12th. Electricity Department. One 6,000-kW, 3-phase turbo-alternator, with condensing plant, pipework, &c. (October 23rd.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Aylesbury.—Town Council. Accepted:—
400-kW rotary converter.—Crompton & Co., Ltd.

Bedford.—Town Council. Accepted:—
Alterations to the two existing 1,500-kW turbo-alternators (conversion from 60-cycle, single phase to 50-cycle, three-phase machines) (£700 and £1,200 respectively).—British Thomson-Houston Co., Ltd., and C. A. Parsons & Co., Ltd.

Belgium.—International competition was again experienced last week for a contract for the supply of 2,000 metres of cable to the municipal authorities of Schaerbeek, Brussels, tenders being received from one British (Callender's Cable and Construction Co., Ltd.), one Danish, one Dutch, two French, four German, and four Belgian concerns. The prices ranged from 85,100 to 146,500 fr., the lowest being that of the Nederlandsch Kabelfabriek Maatschappij, of Delft, Holland.

Bournemouth.—Tramway Committee. Accepted:—
Overhead tank for the generating station (£232).—Barrowfield Ironworks, Ltd.

Dorchester.—Lighting Committee. Recommended:—
Bridge-megger testing set (£53).—Evershed & Vignoles, Ltd.

Glasgow.—Corporation. Accepted:—
Electric lighting work at the Elder Park Clinic (£98).—Johnstone, Park and Co.

Government Contracts.—The following Government contracts were placed during September, 1925:—

Admiralty (Contract and Purchase Department).

Battery spares.—Hart Accumulator Co., Ltd.
W./t. boxes.—Player & Mitchell.
Cells.—Fuller's United Electric Works, Ltd.; D.P. Battery Co., Ltd.; Chloride Electrical Storage Co., Ltd.
Electric stationary crane.—T. Smith & Sons (Rodley), Ltd.
80-ton electric crane.—Stothert & Pitt, Ltd.
Electric travelling cranes.—T. Smith & Sons (Rodley), Ltd.; Cowans Sheldon & Co., Ltd.
Electrodes.—Quasi Arc Co., Ltd.
Fuse holders.—Pinnacle Switchgear, Ltd.
Lampholders.—General Electric Co., Ltd.; Edison Swan Electric Co., Ltd.; Rainsford & Lynes, Ltd.; Sperryn & Co.
Electric incandescent lamps.—Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.
W./t. note magnifiers and w./t. transmitters.—Gambrell Bros., Ltd.
W./t. panels.—H. W. Sullivan, Ltd.; Park Royal Engineering Co., Ltd.
Rotary converter transformer.—Ferranti, Ltd.
Transformers.—Johnson & Phillips, Ltd.
W./t. valveholders.—H. W. Sullivan, Ltd.
20 special switchboards, 130 voltmeters.—Park Royal Engineering Co., Ltd.

War Office.

Submarine cable.—Siemens Bros. & Co., Ltd.
Distribution boards and couplings.—Simmonds & Stokes, Ltd.
Electric cords.—Callender's Cable & Construction Co., Ltd.
Switches.—General Electric Co., Ltd.
Switchboard panels.—Johnson & Phillips, Ltd.

Air Ministry.

Copper wire (Iraq).—General Electric Co., Ltd.
Internal wiring (Catterick).—T. Clarke & Co., Ltd.
Dynamometer.—Crompton & Co., Ltd.

Post Office.

Repairing batteries.—Portsmouth telephone exchange: D.P. Battery Co., Ltd.
Manufacture, supply, drawing-in and jointing cable.—Chichester-Junction for Worthing: Johnson & Phillips, Ltd. Dorking-Worthing—mechanical tandem junction (Scheme II): W. T. Henley's Telegraph Works Co., Ltd. Holborn-Park, Western-Sloane, Hop-Battersea, Holborn-Western, Primrose Hill-Hampstead Junction and Primrose Hill Junction—mechanical tandem junction (Section II): Western Electric Co., Ltd. Canterbury-Dumpton Gap (Kent)—mechanical tandem junction (Section II): Siemens Bros. & Co., Ltd. Brentwood-Marks Tey: Pirelli-General Cable Works, Ltd.
Manufacture, supply, laying and jointing, &c., submarine cable—Anglo-Belgian (1926).—Siemens Bros. & Co., Ltd.
Cabling and wiring for lifts, conveyers, &c., Mount Pleasant new letter-sorting office.—Pinching & Walton.
Conveyors: Mount Pleasant sorting office.—H. Simon, Ltd.
E.h.p. switchgear: Mount Pleasant sub-station.—British Thomson-Houston Co., Ltd.
Private branch exchange equipment.—Vulcan Foundry, Ltd. (Newton-le-Willows); Jarrett, Rainsford & Laughton, Ltd. (Birmingham); Bilsland Bros., Ltd. (Glasgow); Taylor's Drug Co., Ltd. (Leeds); Bank of London & South America, Ltd. (E.C.2): Relay Automatic Telephone Co., Ltd.
Telephone exchange equipment.—Popesgrove (Twickenham): Siemens Bros. & Co., Ltd. Hampstead and York: Automatic Telephone Manufacturing Co., Ltd.
Telephone repeater station equipment.—Glasgow, Gloucester, Newport (Mon.), Marks Tey: General Electric Co., Ltd.
Telephone apparatus.—Automatic Telephone Manufacturing Co., Ltd.; British L.M. Ericsson Manufacturing Co., Ltd.; General Electric Co., Ltd.; Phœnix Telephone & Electric Works, Ltd.; Siemens Bros. and Co., Ltd.; Sterling Telephone & Electric Co., Ltd.; Telegraph Condenser Co., Ltd.; Western Electric.

Battery parts.—Alton Battery Co., Ltd.; D.P. Battery Co., Ltd.; Tudor Accumulator Co., Ltd.
Battery boxes.—W. & T. Lock.
Telephone cabinets.—Siemens Bros. & Co., Ltd.; W. Duncan, Tucker and Co., Ltd.
Cable.—B.I. & H. Cables, Ltd.; Callender's Cable & Construction Co., Ltd.; Connollys (Blackley), Ltd.; Enfield Cable Works, Ltd.; W. T. Glover & Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Hackbridge Cable Co., Ltd.; Johnson & Phillips, Ltd.; Pirelli-General Cable Works, Ltd.; Siemens Bros. & Co., Ltd.; Union Cable Co., Ltd.; Western Electric Co., Ltd.
Joint box castings.—J. Williamson & Co., Ltd.
Porous cells.—General Electric Co., Ltd.
Telephone cords.—B.I. & H. Cables, Ltd.; Phœnix Telephone & Electric Works, Ltd.; Siemens Bros. & Co., Ltd.
Loading coils.—General Electric Co., Ltd.; Western Electric Co., Ltd.
Cable drums.—B.I. & H. Cables, Ltd.; Eames Bros.; Siemens Bros. and Co., Ltd.
Ducts.—Albion Clay Co., Ltd.; Donington Sanitary Pipe & Fire Brick Co., Ltd.; Hepworth Iron Co., Ltd.; H. R. Mansfield, Ltd.; J. Oakes and Co. (Reddings Collieries, Ltd.); Oates & Green, Ltd.; Stanley Bros., Ltd.
Ear pieces.—North British Rubber Co., Ltd.
Electric light fittings.—Cable Accessories Co., Ltd.; W. White & Co.
Electric lamps.—B.I. & H. Cables, Ltd.; British Thomson-Houston Co., Ltd.; Cryselco, Ltd; Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.; Metro-Vick Supplies, Ltd.; Siemens & English Electric Lamp Co., Ltd.
Distribution cable plugs.—Siemens Bros. & Co., Ltd.
Electric trucks.—W. Goodyear & Sons, Ltd.
Wood troughing.—Calders, Ltd.
Bronze and copper wire.—Elliott's Metal Co., Ltd.
G.I. stranded wire.—Dorman, Long & Co., Ltd.; F. Smith & Co. (Wire Manufacturers), Ltd.
Zinc rods.—Eyre Smelting Co., Ltd.; Locke, Lancaster & W. W. & R. Johnson, Ltd.

H.M. OFFICE OF WORKS.

Wiring Royal Courts of Justice, Strand, W.C.—Electrical Installations, Ltd.

CROWN AGENTS FOR THE COLONIES.

Lux cells.—Chloride Electric Storage Co., Ltd.
Electric walking crane.—Ransomes & Rapier, Ltd.
Electric cable.—B.I. & H. Cables, Ltd.
Electric generating plant.—Lancashire Dynamo & Motor Co., Ltd.
Electric switchgear.—Metropolitan-Vickers Electrical Export Co., Ltd.
Electrical materials.—Siemens Bros. & Co., Ltd.
Ceiling fans.—Veritys, Ltd.
Porcelain insulators.—Taylor, Tunnicliffe & Co., Ltd.
Train lighting equipment.—J. Stone & Co., Ltd.
Telegraph ironwork.—Bullers, Ltd.
Telephones.—British L.M. Ericsson Manufacturing Co., Ltd.
Static transformers.—English Electric Co., Ltd.
Copper line wire.—Shropshire Iron Co., Ltd.

Hornsey.—Electricity Committee. Recommended:—
Circuit breakers (£240).—Park Royal Engineering Co., Ltd.

Liverpool.—Health Committee. Recommended:—
Two complete electrically-driven crude sewage pumping sets at the West Derby sewage farm (£1,374).—Drysdale & Co., Ltd.

Tramways Committee. Accepted:—
Structural steel and iron works for the new tramway works and car depôt.—Lambourne & Co., Ltd.

Lowestoft.—Electricity Committee. Accepted:—
2,300 yd. feeder cable (£2,348); 2,300 yd. pilot cable (£245).—Callender's Cable & Construction Co., Ltd.

Lewes.—Board of Guardians. Accepted:—
Extending electric light to all parts of the Institution.—E. L. Tappin and Son.

London.—LONDON COUNTY COUNCIL.—Highways Committee. Accepted:—
1,000-kW rotary-converter, with switchgear and cables, for the Hammersmith sub-station.—British Thomson-Houston Co., Ltd.
Battery for electrically-driven tower wagon (£893).—Edison Accumulators, Ltd.
Works transformer for Greenwich power station (£7,550).—C. A. Parsons and Co., Ltd.

SOUTHWARK.—Electricity Committee. Recommended:—
Cable.—Macintosh Cable Co., Ltd., and British Insulated & Helsby Cables, Ltd.
2,000 ft. copper bar (11½d. per lb.).—British Insulated & Helsby Cables, Ltd.
Feeder pillar (£80).—J. S. Plumtree.

POPLAR.—Electricity Committee. Recommended:—
Instrument equipment and steam flow meters for boilers and turbines (£1,175).—Electro-Flow Meter Co., Ltd.
Steam feed-water and drain systems for the generating station (£7,500).—International Combustion, Ltd.
Temperature indicator (£167).—Cambridge & Paul Instrument Co., Ltd.

Salford.—Electricity Committee. Accepted:—
Cable.—W. T. Glover & Co., Ltd. (£2,621); Western Electric Co., Ltd. (£850).
100 large electric cookers (£1,360).—General Electric Co., Ltd.
150 "Falco" small electric cookers (£1,912).—Hotpoint Electric Appliance Co., Ltd.

Forthcoming Events.

Commercial Motor Transport Exhibition.—October 29th to November 7th. At Olympia, London, W.

Electrical Trades Commercial Travellers' Association.—Friday, October 30th. At Elma Rooms, 15, Savoy Street, W.C.2. At 7 p.m. Lecture on "The Human Aspect of Salesmanship," by Mr. V. W. Dale.

Glasgow Corporation Electricity Department Engineering Society.—Monday, November 2nd. At the Welfare Hall, St. Andrew's Cross Works. At 7.45 p.m. Paper on "Protective Gear," by Mr. R. W. Biles.

Institute of Transport.—Monday, November 2nd. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 5.30 p.m. Annual general meeting. Paper on "One Hundred Years of Railway Development," by Mr. R. Bell.

Society of Engineers.—Monday, November 2nd. At Burlington House, Piccadilly, W. At 5.30 p.m. Paper on "The Influence of Aggregates on the Strength and Properties of Concrete," by Mr. G. O. Case.

Institution of the Rubber Industry.—Monday, November 2nd. At the Engineers' Club, Coventry Street, W. At 8 p.m. Paper on "The Plasticity of Unvulcanised Rubber," by Mr. R. W. Griffiths.

Roentgen Society.—Tuesday, November 3rd. At 32, Welbeck Street, W. At 8.15 p.m. Presidential address, "Atoms and X-rays," by Mr. F. W. Aston, F.R.S.

Electrical Society of Glasgow.—Tuesday, November 3rd. At Glasgow Lecture on "The Impetus of Electrical Marketing," by Mr. V. W. Dale

Institution of Civil Engineers.—Tuesday, November 3rd. At the Institution, Great George Street, S.W. At 6 p.m. Presidential address by Sir W. H. Ellis, and presentation of medals awarded by the Council.

National Association of Supervising Electricians.—Tuesday, November 3rd. At 39, Victoria Street, S.W. At 7.15 p.m. Lecture on "Automatic Telephones," by Mr. H. H. Harrison.

Electrical Trades Benevolent Institution.—Wednesday, November 4th. At the Trocadero Restaurant. At 7.30 p.m. Annual festival.

Royal Society of Arts.—Wednesday, November 4th. At John Street, Adelphi, W.C. At 8.30 p.m. Inaugural address by the Chairman of the Council, Sir H. Holland, F.R.S., on "The Organisation of Scientific Research Throughout the Empire."

Edinburgh Electrical Society.—Wednesday, November 4th. At the Royal Society of Arts, 117, George Street. At 8 p.m. Paper on "Automatic Telephony," by Mr. W. J. H. Piper.

Institution of Mining Engineers.—Wednesday, November 4th. At the Institution of Mechanical Engineers, Storey's Gate, S.W. At 11 a.m. Annual general meeting.

Institution of Heating and Ventilating Engineers.—Wednesday, November 4th. At Caxton Hall, Westminster, S.W. At 7 p.m. Paper on "The Modern Development of Combustion Recording," by Mr. J. J. Lassen.

Institution of Electrical Engineers.—Thursday, November 5th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "Dielectric Problems in High-Voltage Cables," by Mr. P. Dunsheath.

(Wireless Section).—Wednesday, November 4th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Inaugural address by the Chairman, Major B. Binyon.

(Mersey and North Wales (Liverpool) Centre).—Monday, November 2nd. At the University, Liverpool. At 7 p.m. Address by the Chairman, Mr. A. E. Malpas.

(North-Western Centre).—Tuesday, November 3rd. At the Engineers' Club, Manchester. At 7 p.m. Address by the Chairman, Mr. A. G. Ellis.

(Western Centre).—Monday, November 2nd. At the Museum Lecture Theatre, Bristol. At 6 p.m. Lecture on "Domestic Electrification," by Mr. J. W. Beauchamp.

Electrical Power Engineers' Association.—Friday, November 6th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 3 p.m. Lecture on "Electrical Faults in Power Plant and their Location," by Mr. G. M. S. Sichel.

Institution of Mechanical Engineers.—Friday, November 6th. At the Institution, Storey's Gate, S.W. At 6 p.m. Thomas Hawksley Lecture "Some Railway Notes, Old and New," by Sir John A. F. Aspinall.

Junior Institution of Engineers.—Friday, November 6th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette, "Flow Meters," by Mr. W. H. Simmons.

Faraday House Old Students' Association.—Friday, November 6th. At the Piccadilly Hotel. Annual dinner.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names of makers or suppliers of:—

BELATA small single pole switches.
FLODEN electric curling tongs.

Notes.

The Electrical Trades Benevolent Institution.—ANNUAL FESTIVAL DINNER.—On Wednesday next, November 4th, the Festival Dinner of the E.T.B.I. will be held at the Trocadero, London. There is still time to obtain tickets for this function, and thereby to benefit not only oneself, but also the protégés of the admirable Institution by which it is organised. We hope that our readers will take advantage of the opportunity to give it practical support—or, if they cannot attend in person, that they will demonstrate their sympathy with its objects in the usual manner observed among men of goodwill.

The Rt. Hon. F. G. Kellaway will be the principal guest. Tickets can be obtained from Mr. F. B. O. Hawes, 98, Grosvenor Road, S.W.

Late Legal.—BRITISH INSULATED & HELSBY CABLES, LTD., PENSION FUND.—Arguments were heard recently in the House of Lords by the Lord Chancellor, and Lords Atkinson, Buckmaster, Carson and Blanesburgh, in the case British Insulated and Helsby Cables, Ltd., *v.* J. Atherton (Inspector of Taxes), raising a novel income tax point. For the year ended April, 1918, the company was assessed to income tax in the sum of £250,000, against which it appealed on the ground that there should be a deduction of £31,784, in respect of a contribution to a pension fund for the benefit of its clerical and technical staff. The appeal was allowed by the Special Commissioners, and the assessment reduced to that extent, but a Special Case was stated and Mr. Justice Rowlatt upheld the decision. The Court of Appeal, however, reversed the finding and the company appealed to the House of Lords. Sir John Simon, K.C., speaking on behalf of the company, said that the absence of a pension fund had resulted in the company's losing some of its best men, and it was a matter of business that it should provide such a fund in order to keep its men. The sum was, in consequence, money wholly and exclusively expended for the purpose of its trade and the deduction was admissible. Addressing the House on behalf of the Crown, Sir Douglas Hogg, K.C. (the Attorney-General) maintained that as the sum was a lump one and not spread over years, the deduction was not admissible. Their Lordships reserved judgment.

Workmen's Compensation Award.—An electrician, James Henry Cook, of Wilson Street, Thornaby, applied at the Stockton County Court on October 20th for compensation in respect of injuries received while working for Messrs. Thomas Allen and Co., Bon Lea Foundry, Thornaby.

Mr. T. Richardson, for plaintiff, explained that in July his client was working on a crane, when the ladder on which he stood slipped, and in endeavouring to save himself Cook came into contact with a live electric wire. He held this wire until a man, hearing his cries, switched off the current. Applicant fell from the wire to the ground, a distance of 18 ft., and as a result of the mishap two fingers of the left hand had to be amputated. His ankle and shoulder were injured by the fall, his shoulder permanently. Applicant earned £3 a week, and he claimed 30s. a week compensation. Plaintiff admitted in cross-examination that it was his duty to cut off the current before he did any such work, but on this occasion he forgot to do so.

Medical evidence was given to the effect that applicant's shoulder was permanently disabled.

For the defence it was contended that applicant had infringed the regulations in failing to cut off the current, but Judge Moore held that respondents had not established serious and wilful misconduct; the applicant had merely been guilty of inadvertence. He awarded the applicant 30s. a week from the date of the accident.

Engineers' Club Dinner.—The second annual banquet of the Engineers' Club (London) was held at the Savoy Hotel on October 23rd, the president, Sir J. W. Isherwood, Bt., being in the chair. It was a largely attended and very successful function; amongst the many distinguished guests was the Chancellor of the Exchequer, who was the guest of the evening, and whose speech was broadcast from Daventry.

Following the loyal toast, that of "Our Guests" was proposed by the president, and in responding Mr. Winston S. Churchill, P.C., M.P., said that they would be wise in revolting against the prevailing weak, foolish and injurious mood of panic-stricken pessimism. Things were not getting worse and there was even a probability that they might get better. The British share of the oversea trade of the world had not diminished since the war. It was true that there was a reduced amount of world oversea trade, but of that reduced trade this country possessed a slightly larger proportion than it did before the war. In 450 typical businesses there had been an improvement of 11 per cent. in profit-making this year as compared with 1923. There had been a considerable diminution in the cost of living, and the yield of revenue fully bore out the expectations upon which the Budget had been framed. The consuming power of the people had not only been maintained, but in the case of many commodities it had been increased. The savings of the people in National Saving Certificates had increased by £7,000,000 in the present year. The latest estimate which had been laid before him showed that so far from getting poorer, or living on our capital, we were saving capital by hundreds of millions a year. Far fewer days had been lost by strikes this year than last year. Leaving out the exceptional conditions of the coal trade, employment in the general trade of the country had increased by 150,000. It was true that the population was increasing. The number of people who had reached the employable age last year was 700,000. Still there were 250,000 more people at work in the general trade of the country than there were a year ago.

The remission of taxation which was given by the Budget would cost more in the second year than in the first. In consequence it would be necessary either to reduce expenditure, or that there should be some quite exceptional trade expansion, if the Budget of 1926 was to be accurately and honestly balanced. As they could not count on an exceptional trade expansion, let them make sure of a reduction in expenditure, for which conditions were favourable.

Proposing "Success to British Engineering," Sir Philip M. M. Nash remarked, *inter alia*, that they could not live on tradition alone. If they faced the facts, they would find that conditions were not becoming worse; they should dwell on the future, not the past. British engineers wanted opportunities, and the one which showed most promise was the development of the Empire. They should make more use of the brains and achievements of pure science workers. Regarding national development of electricity, it was insufficient to know that the Government was considering the subject; what was required was a pronouncement or guidance as to policy, and now was the time for it.

Sir T. Harris Spencer and Air Chief Marshal Sir Hugh M. Trenchard responded, after which "The Engineers' Club" was toasted by Mr. Winston Churchill, the president replying. A selection of music by the band of H.M. Scots Guards added to the enjoyment of the evening.

London Traffic Inquiry. — An inquiry was opened last week at the Guildhall, Westminster, by a sub-committee of the London and Home Counties Advisory Council, into the traffic facilities in North London. The inquiry was adjourned until November 2nd.

Local Societies.—There was a record attendance of members at a meeting of the Glasgow Corporation Electricity Department Engineering Society held recently to hear the address of the President, Mr. R. B. Mitchell, at the opening of the session, 1925-1926. The President reviewed the work of the department during the past year and outlined the prospects for the current year and for future years. The society is in a flourishing condition and an interesting syllabus of meetings has been arranged for the current session, including a visit to the hydro-electric works at Stonebyres, Falls of Clyde. At the next meeting on November 2nd, a paper on "Protective Gear" is to be delivered by Mr. R. W. Biles, D.F.H., of Messrs. A. Reyrolle & Co., Ltd.

Nottingham Society of Engineers.—The annual general meeting was held on October 12th, under the presidency of Prof. Bulleid, O.B.E., at the Victoria Station Hotel. Mr. E. G. Phillips was elected president for the ensuing year, and addressed the members on the subject: "What is an Engineer?" He quoted, as exactly expressing all that he believed to be essential to an engineer, the qualities specified by Mr. W. Roland Needham in his article on "The Designer and Initiative" (Electrical Review, October 2nd, 1925, p. 532), and pointed out that the engineer had played an important part in developing life as now enjoyed, and was probably the greatest civilising force in existence.

The *Proceedings* of the Society are now printed, through the generous assistance of Ald. Sir John Turney, J.P.

Fatalities.—James Carter, labourer, of Oak Street, Oswaldtwistle, was killed recently at the Broad Oak Print Works, Accrington. An inquest was held on October 23rd, at Accrington. William Nuttall, an electrician employed at the works, stated that on October 19th they were brazing a portable electric light standard in a hot-air chamber in the cleaning department of the works. Carter was his labourer. The light stand was made of half-inch steel tubing and was 10 ft. high, through which ran two electric lighting wires carrying 250-volt alternating current, which lit five electric lamps attached to the tubing and 2 ft. apart. That job was completed, but two days later they were engaged connecting ten electric lighting mains in the distribution box in the cleaning department. Carter was labouring for witness, and he sent him into a room to put the fuses into the main feeder box in order to put the supply on at the place where they were working. Witness went away, and, when he returned ten minutes later, he noticed that the lights in the cleaning department and the hot-air chamber were on. He also noticed that the portable light stand in the hot air chamber was moving. He opened the chamber door, and found Carter lying on the ground, with his neck against the bottom of the light stand. He then ran to the distribution box and withdrew the fuses. Artificial respiration was tried for a quarter of an hour. A medical witness said that the cause of death was suffocation, but he could not say whether it was caused by electric shock, but it probably was. Mr. Topham said that he made tests in company with the electrical engineer, and found conditions which justified him in thinking that Carter might have had an electric shock. The jury found that Carter had died from an "electric shock, or accidental death."

A verdict of "Death due to electrocution," was returned on October 23rd at an inquest on Fred Ackroyd (36), of Oldham, labourer at Asa Lees & Co., textile machinists. After starting an electric motor he received a shock and died immediately. This, it was stated, was the first accident that had occurred at the works, where there were nearly 100 similar motors. It is presumed that the man's clothes acted as a conductor, as he had been out in the rain.

The Proposed Institute of Wireless Engineers.—The meeting in connection with the proposed Institute will be held at the Hotel Russell, Russell Square, London, to-morrow, October 31st. The chair is to be taken at 2.30 p.m. Tea will be served at 5 p.m., and the meeting will be continued till 7 p.m. if necessary. All interested persons are invited to be present.

Mining Electrical Engineers.—Scotland Branch.—Mr. D. Landale Frew, in his presidential address to the West of Scotland Branch of the Association of Mining Electrical Engineers at Glasgow, dealt with the developments in the use of machinery and electricity in coal mining in Scotland. He believed there was still much for the Association to do in the matter of the practical training of the men who handled the machines. The Government had an opportunity of forming training centres for such men, which would be much to the advantage of the coal industry, both to masters and men, in maintaining output and minimising breakdowns. The Association had for many years been considering the matter, but had been up against the difficulty of providing funds for equipping and running such centres.

Appointments Vacant.—Assistant telegraph engineers (probationary), for the Government of the Federated Malay States; switchboard attendant, for the Nuneaton Corporation electricity works; junior charge engineer, for the Derby County Borough electricity department; scientific instrument maker, for the Battersea Polytechnic; cable jointer, for the Middleton Corporation electricity department; combustion engineer, for the Southampton County Borough electricity works; plumber-jointer, for the Southend-on-Sea electricity department; meter repairer, for the Lancaster Corporation electricity works. (See our advertisement pages to-day.)

Finsbury Technical College.—The fourteenth annual dinner of the Old Students' Association of the College will be held at the Engineers' Club, Coventry Street, London, on Saturday, November 14th, at 7 p.m. Ladies are invited. Tickets are 6s. 6d. each, exclusive of wines, and may be obtained from Mr. R. O. Grant, hon. secretary, 70a, Basinghall Street, E.C.2.

The Batti-Wallahs' Society.—On Wednesday last week, the Batti-Wallahs held a re-union luncheon, at which Col. R. E. Crompton, C.B., was the principal guest. Mr. Pooley, presiding, read a letter from Sir Hugo Hirst, regretting his inability to be present owing to indisposition.

Col. Crompton, invited by the president to address the gathering, recalled his first acquaintance with batti-wallahs when he was on the staff of the Commander-in-chief in India, and, after other intimate reminiscences, extolled the merits of men who were always trying to make others happy—a quality which in his long experience he had found more fully developed amongst electrical engineers than in any other class. He expressed a strong desire that electrical men should become better friends with those concerned in the gas industry.

Proposing a vote of thanks to Col. Crompton, Mr. J. W. Beauchamp said that as time went on they would find some means of co-operating with the gas people, but he would regard with distrust any attempt to fix a line of demarcation between their respective spheres. Electricity and gas had both benefited enormously by active competition, to the advantage of the public.

At the suggestion of the president, Mr. E. S. Barralet made a brief appeal for support to the Electrical Trades Benevolent Institution, and a collection realised over £7.

Institution Notes.

Institution of Electrical Engineers.—The arrangements for the first part of the session 1925-26 include the following items:—

Ordinary Meetings of the Institution.

November 5th.—Mr. P. Dunsheath, O.B.E., M.A., B.Sc. "Dielectric Problems in High-Voltage Cables."
November 19th.—Mr. T. Carter. "The Engineer: His Due and His Duty in Life."
December 3rd.—Prof. S. P. Smith, D.Sc. "An All-Electric House."
December 17th.—Mr. C. E. Webb, B.Sc.(Eng.). "The Power Losses in Magnetic Sheet Material at High Flux Densities."
January 7th, 1926.—Capt. P. P. Eckersley. "Past, Present, and Future Developments in Wireless Telephony."
February 11th.—Annual dinner.

Wireless Section Meetings.

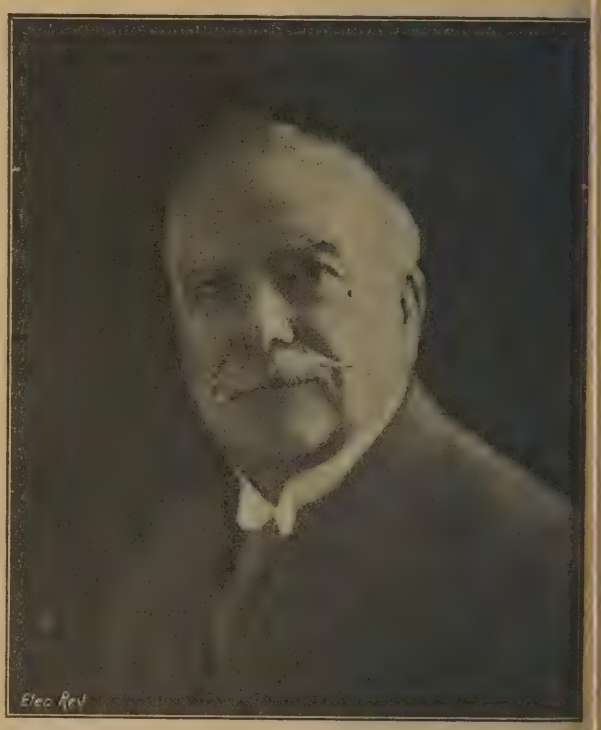
November 4th.—Major B. Binyon, O.B.E., M.A. (chairman of the Wireless Section). Inaugural address.
December 2nd.—Mr. H. A. Thomas, M.Sc. "The Performance of Amplifiers."
January 6th, 1926.—Lt.-Col. K. E. Edgeworth, D.S.O., M.C. "Frequency Variations in Thermionic Generators."

Informal Meetings.

November 9th.—Discussion on "Modern Developments of Telephone Cables." (Opened by Mr. E. S. Ritter.)
November 23rd.—Discussion on "The Testing of Large Electric Plant." (Opened by Mr. E. E. Tasker.)
December 7th.—Discussion on "Design and Performance of Protective Relays." (Opened by Mr. C. L. Lipman.)
December 11th, 1926.—Discussion on "The Electrical Installation in the Rockefeller Building, University College." (Opened by Mr. W. C. Clinton, B.Sc.).

Opening Meeting.—At the first meeting of the 1925-26 session on October 22nd, Mr. W. B. Woodhouse, retiring president, presented the premiums awarded by the Council for papers read last session before the Institution and its Wireless Section. After the presentation of the scholarships awarded by the Institution, Mr. R. A. Chattock, the new president, took the chair, and called upon Mr. Roger T. Smith to propose a vote of thanks to the retiring president; it was seconded by Dr. A. Russell and passed with enthusiasm. The president then delivered his inaugural address, an abstract of which is commenced elsewhere in this issue, and, following a vote of thanks proposed by Mr. S. P. Sparks and seconded by Dr. W. Thornton, the meeting, which was well attended, terminated at 7 o'clock.

Royal Society of Arts.—The 172nd session will be opened on Wednesday, November 4th, at 8.30 p.m., when the inaugural address will be delivered by Sir Thomas H. Holland, K.C.S.I., K.C.I.E., F.R.S., chairman of the Council, on "The Organisation of Scientific Research Throughout the Empire." A course of three lectures under the Cantor Trust will be delivered during the session by Dr. R. Lessing on "Coal Ash and Clean Coal." At the meetings after Christmas papers will be read, including "The Propagation of Electric Waves," by Mr. J. E. Taylor; "Problems in Paint and Varnish Technology," by Dr. H. Houlston Morgan; and "Domestic Heating," by Dr. Mary Fishenden. Courses of lectures will also be delivered by Dr. G. W. C. Kaye on "The Production and Measurement of High Vacua," and by Mr. W. F. Higgins on "Thermometry."



Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. Charles V. Watson has left the service of the Walsall Corporation Electric Supply Department, to take up an appointment as junior mains assistant with the Yarmouth Corporation Electricity Department. Mr. Watson received several presents from his Walsall colleagues.

Last week the Glasgow Corporation approved the appointment by the Superintendent of Lighting, of Mr. Edward Stewart, head of his technical staff, to be assistant inspector in the place of Mr. Milner, who served the municipality for half a century. Mr. Stewart graduated M.A. and B.Sc. at Glasgow University, and before entering the Lighting Department was science master at Airdrie Academy.

Mr. C. Newton Russell, Assoc.M.I.C.E., M.I.E.E., w is shortly retiring from the service of the Shoreditch Boro Council, has served with that body as electrical engineer nearly 29 years. He served his apprenticeship at Stockt on-Tees, afterwards taking up the study of electricity visiting electrical works in the United States. He was some time a student in the School of Telegraphy and E trical Engineering, Hanover Square. In 1882 he joined firm of W. T. Goolden & Co., and had charge of their sect of the lighting of the Inventions and other exhibitions South Kensington, also the carrying out of a large amo of important work on warships for the British Admiralty a the Indian Government. In 1887 he was appointed engin to the Acton Hill Electrical Works, and five years later beca manager to the London and Lancashire Electrical Co., D ston. In 1896 he was appointed chief electrical engineer the Vestry of St. Leonard's, Shoreditch (now the Met politan Borough of Shoreditch), his present position. Newton Russell has contributed several papers to vari engineering societies on the subject of steam-raising by mea of the burning of town's refuse, and he was awarded Telford Premium by the Institution of Civil Engineers. Wh acting as electrical engineer to the Borough of Shoredit Mr. Newton Russell has been responsible for carrying extensions of plant and mains to the value of over half million sterling. A further extension of the Whiston Str electric power station has recently been sanctioned by t Electricity Commissioners, comprising the installation of

Navana, Ltd. [*Londo*

Mr. C. Newton Russell.

10,000-kW turbo-alternator, boiler, switchgear, &c., at an est mated cost of £70,000. For some years Mr. Newton Russell ha acted as one of the representatives of the Incorporated Munic pal Electrical Association on the British Engineering Standard Association. During the war he took an active part in co nection with the inception of the Metropolitan Munition Committee, of which he was one of the earliest member and was appointed by that body to act as district manage for the greater part of the eastern area of London; he serve throughout the war in that capacity. Although Mr. Russe is retiring from an active part in the management of th Shoreditch undertaking, his services are being retained b the Council as consulting engineer in an advisory capacit for a period of one year, as stated in these pages last week Mr. Newton Russell's successor is Mr. William Weekes A.M.I.E.E., who has been chief assistant at Shoreditch fo many years, and has been in the employ of the Council fo about 28 years. Mr. Weekes has a thorough knowledge o the undertaking, and we wish him success in his new position

Mr. Dean K. Chadbourne has been appointed genera manager of the Westinghouse Electric International Com pany to succeed Mr. E. D. Kilburn, who was recently elected vice-president of the Westinghouse Electric & Manufacturing Company.

Mr. Leonard Johnson, traffic superintendent of the Bir mingham Tramways, is in hospital suffering from a bullet wound received on Saturday morning. A tramway inspector named John Henry Cuttler has been arrested in connection with the affair.

Mr. C. L. Holman, manager since 1919 of the Stamford Elec tricity Works, has been appointed to a similar position at Frome, Somerset, where he will commence his duties next month

Mr. R. W. Gregory, the new chairman of the North-astern Centre of the Institution of Electrical Engineers, whose ortrait accompanies this note, is the head of Messrs. Merz id McLellan's electrical department. Mr. Gregory was born North Cadbury, Somerset, in 1882, and was educated at exey's School, Bruton, and Finsbury Technical College. In 01 he joined the Newcastle-upon-Tyne Electric Supply Com-iny, and, under Mr. H. L. Risley, obtained experience on ie construction and operation of the Neptune Bank and arville power stations. Mr. Gregory joined the staff of essrs. Merz & McLellan at the end of 1903, and, under Mr.

Bacon & Sons] *[Newcastle-on-Tyne.*

Mr. R. W. Gregory.

Chairman of the North-Eastern Centre of the I.E.E.

ernard Price, worked on the North-Eastern Railway electrifi-ation scheme, the construction of the Dunston power station, nd the development of the 20,000-V distribution system on the orth-East Coast. Later he became chief electrical draughts-an and switchgear engineer for his firm. During his long ssociation with Messrs. Merz & McLellan, Mr. Gregory has orked on many important schemes, among them being ailway electrifications in Argentina, Australia, South Africa, nd India; the Barking power station of the County of ondon company; the Mersey Power Company's develop-nents; and the electricity supply system of the North-East oast Power Companies. Mr. Gregory has served on the ritish Engineering Standards Association sub-committee on il break switches and switchgear, and the British Electrical nd Allied Industries Research Association sub-committee on il circuit breakers. His paper on "Sub-station Design with articular reference to Metal-Clad Switchgear" was read n Paris this summer at the International Conference on Extra-High-Pressure Systems. Mr. Gregory delivered his naugural address on Monday last.

At a meeting of the Fleetwood District Council, on October 21st, a motion to rescind a resolution to raise the salary of he Council's electrical engineer in accordance with the recog-nised scale was defeated.

The Highways Committee of the London County Council ecommends that Mr. T. E. Thomas, development superinten-lent, be promoted to the position of traffic manager in the raffic branch of the tramways department, at a salary of £1,200, rising to £1,500 a year (based on pre-war conditions); hat Mr. F. Scothorne, traffic statistics assistant, be pro-noted to the position of development superintendent in the raffic branch of the tramways department at a salary of £500, rising to £800 a year (based on pre-war conditions); that Mr. E. A. Wood, assistant superintendent of the central repair lepôt, be promoted to the position of superintendent of the entral repair depôt in the rolling stock branch of the tram-ways department, at a salary of £500, rising to £650 a year based on pre-war conditions); that Mr. R. E. S. Macintyre, echnical assistant (Grade 2) be promoted to the position of permanent-way engineer in the tramways department at a alary of £500, rising to £600 a year (based on pre-war con-litions).

The silver wedding was celebrated on October 14th of Mr. nd Mrs. L. B. Cantwell. Mr. Cantwell is head of the firm of Messrs. Cantwell & Hedger, electrical engineers, of High Street, Broadstairs.

M. Minieur, director of the Tunis Electricity & Gas Co., has lately been appointed a Chevalier of the Légion d'Honneur.

We reproduce herewith a portrait of Mr. A. E. Malpas, the new chairman of the Mersey and North Wales (Liverpool) Centre of the Institution of Electrical Engineers, who is to deliver his address on Monday next. Mr. Malpas was born in London in 1871. From 1885 to 1891 he was an apprentice in marine engineering at the Portsmouth Dockyard, where he gained experience in the various departments. While an apprentice he gained a Whitworth Exhibition and proceeded to Victoria University, Manchester. In 1892 he gained a National Scholarship, which took him to the Royal College of Science, London. Mr. Malpas gained a Whitworth Scholarship in 1893, which enabled him to attend lectures in electrical engineering under Prof. Ayrton, at the Central Technical College. Upon leaving college in 1894 he joined Messrs. Willans & Robinson, Ltd., as assistant in their Contract and Estimating Department. From 1897 to 1899 Mr. Malpas served as chief engineer and manager to Messrs. Calvert and Co., Manchester, and while with them carried out power and lighting installations in various parts of the country. His next post was with Messrs. Arthur Guinness, Sons and Co., Ltd., Dublin, who were spending over £100,000 on extensions to buildings and plant for the generating station. Having completed this work, Mr. Malpas went to the United Alkali Co., Ltd., as chief assistant to the superintending engineer, and in this capacity erected the first Kestner evaporator in England, for the concentration of caustic liquors in connection with a waste heat recovery scheme. He was also responsible for the construction and erecting of a battery of electric furnaces operated by gas-driven sets, aggregating 500 h.p. In 1903 he went to Spain as engineer to the Sociedad de Gasificacion Industrial, to take charge of the building and operation of a 12,000-h.p. gas producer plant erected in Madrid for the public supply of electricity. This company subsequently undertook a hydro-electric development upon the river Tagus, installing turbines with a capacity of 15,000 kVA. While in Spain, Mr. Malpas rendered assistance to the Electrolytic Chemical Co., of Aboño, Asturias, and he was subsequently with other chemical companies in Spain. He was recalled from Spain in 1915 to take up the position of manager of the Ammonia Soda Co., Ltd., with which he had previously served. When these works were taken over by Messrs. Brunner, Mond & Co., Ltd., Mr. Malpas transferred to the United Alkali Co., Ltd., as manager of the Perchlorate Works, Flint, and in 1919 he was appointed chief engineer to the company. After about six years in this position he commenced to practise as a consulting engineer in Liverpool, remaining consulting engineer to the United Alkali Co. Mr. Malpas is a member of the Institutions of Electrical, Mechanical and Chemical Engineers.

Lafayette] *[Manchester.*

Mr. A. E. Malpas.

Chairman of the Mersey and North Wales (Liverpool) Centre of the I.E.E.

We are asked to state that Mr. E. H. Woodhall has resigned from the board of directors of Messrs. Woodhall and Partners, Ltd., Swansea, and is not now connected with the company.

Mr. Harold C. Rogers, who for many years represented the British Thomson-Houston Co., Ltd., on the South Coast, will represent the Stearn Electric Co., Ltd., in that district from November 1st.

Mr. R. C. Bullough, who was manager and engineer of the Colchester Corporation Tramways from their inception 21 years ago until his retirement recently, has been presented by the employés of the department with a gold albert.

Mr. William A. McGilvray has joined the staff of the British Ebonite Co., Ltd., and will represent it in the North of England.

Mr. H. J. Nisbett, who has been manager of the Torquay Tramways Company for many years, is retiring from that post in order to devote his whole attention to public work. He is at present engaged in a municipal contest in the Babbacombe ward.

Obituary.—Mr. J. Malone.—The death took place on October 16th of Mr. James Malone, of Barnstaple, where he had carried on business as an electrician for 20 years. He was 70 years of age.

Herr F. T. Horn.—The death recently occurred, at the age of 71 years, of Herr Friedrich T. Horn, founder of the Horn Tachometer and Electric Measuring Instrument Works, of Grosszschocher, Leipzig.

Herr M. Hahn.—The death is reported from Vienna of Herr Max Hahn, general director of the Austrian Berliner Telephone Works, of that city.

Wills.—The late Mr. A. E. Mills, M.A., M.I.E.E., Fellow of the Physical Society, of North Finchley, consulting engineer, left £10,767 gross and £7,692 net personalty.

The late Mr. E. P. Simpson, a director of Worthington Simpson, Ltd., left £20,579 gross and £17,769 net personalty.

New Companies Registered.

British Rolled Steel Pole Co., Ltd. (209,065).—Private company. Registered October 17th. Capital, £10,000 in £1 shares (6,000 8 per cent. preferred ordinary and 4,000 deferred ordinary). Objects: To acquire a certain patent relating to improvements in the construction of telegraph, telephone and electrical service poles and masts and for other purposes. The first directors are:—F. L. Baldwin, Bentley Lodge, Banstead, Surrey; F. L. Broughton, Fieldhead, Hempstead, Gloucester; J. Payton, The Grange, Warwick Road, Solihull, Warwickshire; H. Kershaw Walker, Sandringham House, Sutton, Surrey. Qualification, 100 preferred ordinary shares. Remuneration (except managing director, if any) as fixed by the company. Secretary: A. F. Smith. Solicitors: Markby, Stewart & Wadesons, 5, Bishopsgate, E.C.2. Registered office: 3, Throgmorton Avenue, E.C.2.

Valco, Ltd. (209,073).—Private company. Registered October 17th. Capital, £100 in £1 shares. Objects: To carry on the business of electrical, mechanical, wireless and general engineers, inventors, designers, manufacturers and repairers of, agents for, and dealers in lamps, valves, batteries, accumulators, receivers, amplifiers, and other electrical goods, accessories and materials, &c. The subscribers (each with one share) are:—P. V. Castell-Evans, Carn Dochun, Elthorne Heights, W.7, engineer; J. E. Oliver, 18, Milner Road, Merton Park, S.W.19, sales manager. The first directors are to be appointed by the subscribers. Secretary: J. E. Oliver.

Barclay, Young & Co., Ltd. (209,088).—Private company. Registered October 19th. Capital, £250 in 225 5 per cent. non-cumulative preference shares of £1 and 1,000 deferred shares of 6d. each. Objects: To carry on the business of electrical engineers and contractors; to promote companies for the purchase of rubber, oil and timber properties, mineral concessions or other properties; to carry on newspapers, to act as financiers, manufacturers, shipowners, carriers by land or sea; to construct and maintain roads, works, buildings and conveniences, &c. The subscribers (each with one preference share) are:—A. M. Kinnear, 65, Dalmeny Avenue, Norbury, S.W.16, engineer; W. R. Patterson, 12, Meyrick Road, Clapham Junction, S.W., clerk. The first directors are to be appointed by the subscribers. Secretary: S. E. Young. Registered office: 115, Hammersmith Road, W.14.

A. E. Pierson & Son, Ltd. (209,052).—Private company. Registered October 17th. Capital, £2,000 in £1 shares. Objects: To acquire the business of a lamp shade manufacturer and ornamental wire worker carried on by A. E. Pierson at 414, Edgware Road, W., as "A. E. Pierson and Son." The first directors are:—A. E. Pierson, Sun Villa, Northolt Junction, lamp shade manufacturer (permanent governing director); Harriet L. Pierson, Sun Villa, Northolt Junction. Qualification, 1 share. Solicitors: Greville and Averill, 35, Baker Street, Portman Square, W. Registered office: 414, Edgware Road, W.

Hygienic Telephone Attachment Co., Ltd. (209,148).—Private company. Registered October 21st. Capital, £2,400 in £1 shares. Objects: To adopt an agreement with E. A. Jones and to carry on business as manufacturers and traders of the Jones hygienic telephone attachment, &c. In a winding-up the patent rights shall revert to E. A. Jones except in such countries where such rights have been disposed of. The directors are:—E. A. Hosband, 52, Rupert Street, W.1; W. D'Oyley Rochfort, 52, Rupert Street, W.1; L. R. Warrens, 12, St. Simon's Avenue, Putney, S.W.15; and E. A. Jones, 50, West End Lane, Hampstead, N.W. Registered office: 52, Rupert Street, W.1.

Truescrews, Ltd. (209,134).—Private company. Registered October 20th. Capital, £500 in £1 shares. Objects: To carry on the business of factors, manufacturers, wholesalers, importers and exporters of and dealers in metal screws, nuts, bolts, washers, terminals and the like, and all kinds of goods appertaining to the wireless, electrical and engineering trades and industries, &c. The first directors are:—H. F. Maslin, 1, St. Andrew's Road, Stamford Hill, N.16, sales manager; E. R. Gilbert, The Cottage, Greenford Station, South Harrow, advertising agent. No qualification required. Solicitors: Denton, Hall and Burgin, 3, Gray's Inn Place, W.C.1. Registered office: 58, Ludgate Hill, E.C.4.

Rectalogy, Ltd. (209,129).—Private company. Registered October 20th. Capital, £500 in £1 shares. Objects: To carry on the business of dealers in and importers and exporters of all kinds of metals and alloys, manufacturers of and dealers in accessories and fittings of every description, and all kinds of goods in connection with wireless, electrical and engineering trades and industries, &c. The first directors are:—W. S. Worthington, Little Pipers, Clay Hill, Enfield, manufacturer (chairman and managing director); E. R. Gilbert, The Cottage, Greenford Station, Middlesex, advertising agent. No qualification required. Solicitors: Denton, Hall and Burgin, 3, Gray's Inn Place, W.C.1. Registered office: 58, Ludgate Hill, E.C.4.

T. D. Morison, Ltd. (209,132).—Private company. Registered October 20th. Capital, £1,000 in £1 shares. Objects: To carry on the business of electrical and mechanical engineers, toolmakers, metal workers, smiths, woodworkers, metallurgists, and chemists, manufacturers and repairers of and dealers in motor cars, motor cycles and other vehicl manufacturers and treaters of and dealers in textile fabrics, leather goo drugs, chemicals, &c. The subscribers (each with one share) are:—F. Winterbotham and H. K. Lee, both of 10 and 12, Bishopsgate, E.C.2. T. Morison is the first director. Solicitors: Waterhouse & Co., 10 and Bishopsgate, E.C.2.

Industrial Gases, Ltd. (209,175).—Private compan Registered October 22nd. Capital, £10,000 in £1 shares. City Notes.

eports and Meetings of Electrical Companies; Dividend Results, &c.

isbon Electric ramways, Ltd. The directors' report for the year ended December 31st, 1924, states that there was a net profit of £80,397 after deducting interest and amortisation on the debentures the Cia. Carris de Ferro de Lisboa, and on the company's vn debentures, and the payment of London expenses. To is sum is added £25,066 brought forward, making £105,463. this amount £32,000 is transferred to depreciation account, 33,833 is set aside for the payment of arrears of preference vidends, and the balance (£9,630) is carried forward. There as a fall in the number of passengers carried during the year om 89,566,215 to 83,782,431. Higher wages increased the ex-nses, but this rise was more than met by the improvement the traffic revenue. The payment of the cumulative prefer-ice dividend has been brought up to December 31st, 1919.

Italian Companies. The *Società Piedmontese di Elettriche*, of Turin, is increasing its capital to 200 million lire with the object of acquiring a 70 per cent. interest in the Società Telefonica terregionale Piedmontese. The title of the first-named con-rn is also being altered to the Società Industrie Elettro-tele-niche "S.I.E.T."

The *Società Italiana dei Servizi Radio-telegraphici e Radio-lefonici*, of Rome, has lately changed its title to the *Società aliana Marconi*.

French Companies. The report of the *Société de la Maison Breguet*, of Paris, shows a net profit of 1,971,932 fr. for the financial year 1924-25, as compared with 2,172,453 fr. in the preding year. The dividend on the old shares is being reduced om 60 to 50 fr.

Herbert Morris, Ltd.—The profit for the past year, after lowing for income tax, was £71,150. To this are added 30,224 brought forward and £8,936 from investments, &c., aking £110,310. It is proposed to pay a further dividend on e ordinary shares, making 10 per cent., free of tax, for the ar, to capitalise £6,225, to transfer £10,000 to reserve, and carry forward £33,141. The meeting is to be held to-day riday) at Loughborough.

North Wales Power Co., Ltd.—The report for 1924 re-rds a profit of £40,477, and the available balance, after ducting debenture interest, &c., and adding £2,686 brought rward, is £20,205. A dividend of 8 per cent., less tax, is commended on the cumulative participating preference ares, leaving £3,219 to be carried forward.

Electrical Distribution of Yorkshire, Ltd.—The company s posted letters offering 250,000 ordinary shares to the share-lders at 26s. per share. The system of the company has been eatly extended, as a statement printed in our advertise-ent pages to-day indicates. At a meeting held a short time o it was resolved to increase the capital of the company from 50,000 to £500,000 by the creation of 250,000 new shares.

S. Smith & Sons (Motor Accessories), Ltd.—A meeting as called for yesterday of the holders of the company's 8½ per nt. first mortgage debentures. A resolution was to be sub-itted providing for a further postponement of the commence-ent of drawings and contributions to the sinking fund until tober, 1926, and January, 1927, and to postpone the ultimate demption date to 1938.

Western Union Telegraph Co. (Inc.).—A report cover-g the period from January to September (nine months) ows that the gross revenues amounted to $94,141,130, as mpared with $84,861,418 in the equivalent period of last year. he total expenses increased from $73,615,988 to $80,843,586, d the net income from $9,511,355 to $11,545,490.

Stock Exchange Notice.—Dealings in the following have en specially allowed by the Committee under Rule 159:—
Shropshire, Worcestershire, and Staffordshire Electric Power Co.—14,145 per cent. cumulative preference shares of £1 each, fully paid, Nos. 45,856 to 1,160,000.

Lancashire Electric Light and Power Co.—A meeting of e shareholders was to be held yesterday (Thursday) to nction the creation of 250,000 new £1 shares, increasing the dinary capital to £1,000,000. It is proposed to issue these rtly, and present shareholders will be given preference.

Dumbarton Burgh and County Tramways Co., Ltd.—he report for the year ended July 31st shows an available llance of £2,781, as compared with £3,079 in 1924. Of this nount £2,781 has been set aside for debenture stock redemp-on, and the balance (£202) is carried forward.

Montreal Light, Heat and Power Consolidated.—A divi-nd of $2 per share has been declared on the common and eferred shares in respect of the quarter ending October 31st.

Glenfield & Kennedy, Ltd.—An interim dividend of 4 per nt. has been declared on the ordinary shares, as compared ith 2½ per cent. in 1924.

United River Plate Telephone Co., Ltd.—The directors opose to pay an interim dividend of 3 per cent., free of x, on the ordinary shares, as in 1924.

Stanton Ironworks Co.—An interim dividend of 4 per nt., free of tax, has been declared on the ordinary shares, in 1924.

Calcutta Tramways Co., Ltd.—An interim dividend of per cent. (actual), free of tax, has been declared on the dinary shares.

Stocks and Shares.

Monday Evening.

Stock Exchange markets—or, to be more accurate, some of the Stock Exchange markets—are extremely busy. In illustration it may be mentioned that the price of Stock Exchange shares has risen from 116 a month ago, to 130, ex 48s. dividend, to-day. A "nominational," without the acquisition of which no candidate can obtain membership, changed hands at £80 five weeks ago, but the price is now nearer £500. Cable manufacturing shares, and electrical equipment issues, are remarkably better on the week. New stocks and shares find a welcome ready-made if they offer any reasonable temptation to the investor and the speculator.

Advances have occurred in British Aluminium, Brush, Callenders, Edisons, English Electrics, Generals, Johnson and Phillips, Henleys, Siemens, and others. References to our price lists will show the unusual strength displayed by this department. Moreover, the seller will find it much easier to deal at middle prices than the buyer. The supply of shares is extremely limited. In a few cases the dealers prefer not to sell at all, because they do not know where to go to replace what they part with; in other cases buyers are told that they may have to wait some considerable time, if they insist upon dealing, before delivery is likely to be effected.

Iron, steel, and engineering shares have advanced materially. Babcock, ex 1s. dividend, are 3s. 6d. up to 2⅝. It is said that a campaign has been quietly organised, in high official quarters, to preach "prosperity" to the nation, and that this has started the rise in "heavy" shares, in shipping and in railway stocks. Central London Assented ordinary, Metropolitan Consolidated, Districts and Undergrounds are all higher, and the market for steam stocks is as good as that for what are called the Tube issues.

Colonial and foreign traction descriptions follow the same upward path. Anglo-Argentine Tramways firsts are 1/16th lower, but the British Columbia, Brazil Tractions, Rio Tramways seconds, Mexican Light and Power preferred are amongst those which have gained on the week. British Columbia stocks, in particular, are a strong market.

One of the new company registrations is Electricity Distribution of North Wales and District, formed with a capital of 200,000 preference shares of £1 each and 110,000 ordinary shares of 1s. each.

Cable and telephone stocks are not behind the general list in the firmness of their market. Chili Telephones have put on 11s. 3d. to 6 5/16ths, owing to the permission for an increase in the company's scale of rates. United River Plates continue their steady rise, and are ⅛ better at 7⅜. The new shares stand at 2½ premium over the issue price. Indo-Europeans have gained 35s. The Eastern stocks and shares are strong. Anglo-American preferred is 1 higher at 102 ex dividend. In the wireless division, Canadian Marconis have been up to 7s. 6d., but relapsed a few pence. Marconis remain at 28s. 9d., and Marines can be bought at 17s. 7½d. Burndept preferred and deferred found strong support from United States buyers.

Details given here last week (Electrical Review, p. 670) of the offering of American Utility issues on this side have aroused attention, and some inquiry as to what companies are concerned. There are several. One that may serve as an illustration is the Central Illinois Public Service Company. This undertaking, according to particulars in London circulation, furnishes electric light and power directly to 194 communities in Illinois. It sells electrical energy at wholesale (*sic*) to 26 other public utility communities; serves eight communities with gas, 11 with water, five with heat, and five with electric railway service, and electric intersuburban railways are operated. It further operates 11 ice plants. The registrars and the transfer office are in Chicago.

These, and other similar American utility companies may be—and doubtless are—excellent institutions, but, without expressing any opinion upon the security offered by their shares, the opinion may be reiterated that British capital can find employment to equal advantage in British companies. The latter require money for development that can give employment to large bodies of British workmen, and the extension of the electrical field in this country will help to remove the reproach, so often heard from Americans, that Great Britain lags behind in the provision of the facilities to all kinds of industry that electricity alone can afford.

London supply shares are quiet. County ordinary have regained 1s., and the new preference can be sold at 21s. 1½d. premium. Urban preference at 18s. 9d. ex dividend pay £6 8s. per cent. on the money, and look a reasonable speculative investment at that level. Some of the provincial companies' shares have eased off a trifle. Clyde Valleys are 1s. lower at 27s. 6d.; falls of 6d. apiece have left Lancashires at 25s. 6d. and Midland Counties at 22s. 3d. Geographically, the electricity supply market is located in the Stock Exchange cheek-by-jowl with the rubber share department, in which business is still upon an enormous scale, dwarfing interest in some of the more humdrum markets where price fluctuations occur more calmly and less frequently. Confidence in continuance of strength in rubber shares remains unabated.

The Society of Technical Engineers.—At a full meeting held at its headquarters, London, on Saturday last, the Executive Council of the Society unanimously adopted the following resolutions:—

"That since a condition of membershiup of the new Staff Benefit Society being promoted by the Engineering and Allied Employers' National Federation is an undertaking not to belong to any professional protective organisation—all such organisations being covered by the ban against registered or unregistered Trade Unions—we call on all members of the engineering profession to refrain from joining this body, which deprives its members of their common rights of citizenship; further, that the action of the Employers' Federation would appear to be an affront to the engineering profession and an attack upon the peaceful policy of the third party in industry."

"That the Society of Technical Engineers would, however, welcome the participation of the Employers' Federation in promoting a staff benefit scheme without the obnoxious condition referred to above."

"That we have seen with sincere regret the resolution of the Trade Union Congress expressing disapproval of attempts "to foist upon industry third party ideas concerning the position of administrative staffs" and declaring that there can be no middle position between employers and labour; that this action of the Trade Union Congress is an unwarranted effort to coerce organisations of professional and administrative staff workers into the ranks of Labour and to dictate to them what their policy shall be; that in the face of this attack we reaffirm our adhesion to the third party position, in the confident belief that complete independence of control by the organisations of both the employers and the manual workers, such as the third party position secures, is the right policy for protective associations of professional and administrative staff workers."

The matter is referred to in our leading columns to-day.

Swedish Electrical Imports.

The following figures, showing the values of the imports of electrical and allied goods into Sweden in 1924 are taken from the recently-published official trade returns. For purposes of comparison the figures for 1923 are given and notes of increases or decreases are made.

Belgium	43,000	25,000	− 18,000

(£1=about 17 kr.)

Russian Electrical Notes.

Production of Apparatus.—The equipment at the Electro-apparat works, which has been under care and maintenance, has now been restored and production was to be started again by the Leningrad Machine Trust at the beginning of October.

Credit Facilities.—In the interest of facilitating the securing of credit for electrical works, the directors of the Electrical Bank reduced on October 1st the rate of interest on long-term loans from 12 to 10 per cent. Moreover, the bank has put forward an application for permission to extend the period for long-term loans from 10 to 12 years.

Wireless Apparatus.—The Radio Transmission Company has just placed orders with the Leningrad Low-Pressure Trust for the delivery of wireless apparatus for the sum of 5,000,000 roubles. As the country's production is insufficient to satisfy the home demand, the company has made application for permission to purchase wireless apparatus abroad for the amount of 1,300,000 roubles.

The Schatur Station.—The first turbo-generator of 16,000 kW at the Schatur station was brought into regular operation at the end of September, the current being transmitted along an overhead line at 115,000 volts to Moscow. It is proposed to start the second machine of the same size in November when, besides supplying Moscow, current will be furnished to a number of industrial undertakings.

Rural Electrification.—The General Electrical Commission has forwarded to all organisations connected with works of rural electrification a request to prepare a definite number of standard types of installations, which are to be summarised and considered at a special conference. At the same time the Electric Planning Commission has decided that it is necessary for the assignments in the budget for 1925-26 for works of rural electrification to be increased from 10,000,000 to 15,000,000 roubles.

As a consequence of the absence of information concerning small installations in, and the actual application of electrical energy in the agricultural industry, the General Electrical Commission six months ago dispatched a representative to make an investigation of the question in the districts of Kostromsk, Yaroslav, and in various parts of the Ukraine (Kharkoff, Poltav, Kieff, Kherson, Pervomaisk, &c.). The inquiry has revealed the fact that small fuel stations and small hydro-electric stations predominate in the agricultural districts visited, these being of a capacity of only from 40 to 50 kW, and in a few cases of 150 kW. Most of the stations only serve for lighting, there being no power load, and they do not work all the year round. The information collected will be utilised in dealing with the question of loans for the electrification of agricultural districts.

Rural Supply Schemes.—The National Commissariat for Agriculture has opened an international competition for the submission of rural electrification schemes. Entries are said to have already been received from foreign firms, and American firms are stated to have asked for an extension of the time for the presentation of projects.

Foreign Turbo-Generators.—According to a report placed before the General Electrical Commission, turbo-generators of 5,000-kW capacity, the construction of which in Russia is still under contemplation, can be ordered abroad at prices which are considerably lower than those quoted by the electrical trusts. Also, the foreign sets are more economical in working and can be delivered in a shorter time than by the Soviet works. In view of these circumstances, the Commission has decided to ask the General Metal Commission and the General Electrical Trust to present a report concerning the prospects of the construction of turbo-generators in Russia and of the possibility in the next few years of reducing to a minimum the difference between home and foreign prices, quality, and time of construction.

A Large Generator from England.—The Electrotok, of Leningrad, is reported to have placed an order in England for the delivery of a generator of a size hitherto not used in Russia.

Turbo-Generator Performance.—The Leningrad Electric Machine Trust is reported to have received information from Rostoff that the 3,000-kW turbo-generator, which was the first of this size to be made in Russia, has just been put into operation. The results have been satisfactory and the steam consumption is claimed to be lower than in the case of foreign turbo-generators.

Large Steam Turbine.—The Leningrad Metallurgical Works has begun the assembly of a 10,000-kW steam turbine which was ordered by the Southern Steel Trust for the Briansk iron and steel works. This is the first machine of the size which has been constructed at the works.

New Manufacturing Works.—The General Electrical Commission has presented to the Supreme Council of National Economy a report on the proposed capital expenditure on the electrical manufacturing industry in the year 1925-26, which commenced on October 1st, 1925. Of the total, it is proposed to apportion 17,000,000 roubles to the heavy branches, 4,268,000 roubles to the Low-Pressure Trust, 230,800 roubles to the Accumulator Trust, and 150,000 roubles to the Karbolit works. New producing works are included in the total for the sum of 8,879,000 roubles; the provision of new equipment represents 8,182,000 roubles, and repair works 2,904,000 roubles. As to the necessity for the establishment of entirely new works it is mentioned that the firm orders on the books of the trusts at the present time already represent 65 per cent. of the productive programme of the General Trust (the amalgamated Central and the Leningrad Electrical Machine Trusts) for 1925-26, 65 per cent. in the case of the Low-Pressure Trust, and 55 per cent. in that of the Accumulator Trust. It is proposed to begin the construction of new works for the manufacture of standard sizes of machines, and to reconstruct the former Provodnik works for the turning out of small transformers, machines, and lamps. It is expected that the total capital outlay will have the effect of increasing by 63 per cent. the value of the total output of all the producing branches, while at the same time it is anticipated that the prime costs will be reduced by 14 per cent.

Ural Extensions.—It is reported from Sverdlovsk that the Ural District Council of National Economy has prepared a scheme for the extension of the Eropshin station in order to be able to supply energy to the Alapaeff works and asbestos mines. It is proposed to install two 3,500-kW turbo-generators and to transmit the power to the works and the mines by overhead lines. The initial extension of the station to 4,500 kW will involve an expenditure of 2,310,000 roubles, and the work is to be completed by next April.

A New Kaschir Station.—Preparatory works have begun in connection with the construction of a new Kaschir station, which will be equipped with two 20,000-kW turbo-generators. The existing Kaschir station, which can no longer satisfy the growing demand in Moscow, will be kept in reserve on the completion of the new works, one half of which is expected to be ready in the autumn of 1927.

A Large Combination.—The State Planning Commission has approved a scheme for the formation of a big union of interests by the amalgamation of the "Moges" (Moscow and district supply organisation), the Moscow tramway power station, the Electrical Transmission concern, and the Kaschir and Schatur regional stations, together with the sub-stations, peat-producing, and auxiliary undertakings. All these represent a total capital of 63,834,000 roubles, and the name "Moges" will be retained.

The Moscow Cable Network.—As a result of an investigation made by a committee of the Supreme Council of National Economy, it has been found that recent interruptions in the electricity supply in Moscow have been due to short circuits in parts of the cable network. The committee has decided that it is necessary to carry out the reconstruction of the network in the near future. The supply authority, known as the "Moges," intends to replace the existing oil-break switches and cut-outs at all important parts of the network.

Hydro-Electric Works.—A new hydro-electric works of 5,000 kilowatts is to be constructed to utilise the fall of the River Velikoi, about eight miles from Pskov. The preliminary works have been entrusted to the Electropomosh Company.

A New Accumulator.—Prof. A. F. Ioffe, of Leningrad, claims to have evolved a new accumulator which permits of the concentration of a large amount of energy within a small space. Work is now being carried out with a view to the application of the discovery to industrial purposes.

Manufacturing Profits.—The Electric Machine Trust, of Leningrad, which has now been amalgamated with the Central Electrical Trust, reports that the value of its turnover in the year ended September 30th last amounted to 30,000,000 roubles, as compared with 13,000,000 roubles in 1923-24. A profit of 2,000,000 roubles is claimed to have been made for 1924-25.

Mine Electrification.—It is reported from Ekaterinoslav that work is proceeding in connection with the electrification of the manganese and iron ore mines in the district of Krivoi Rog. An installation of 3,000 kW is to be started early in January at the October mine. A station of 30,000-kW capacity is shortly to be constructed in the iron ore district.

A New Peat Fuel Station.—It has been ascertained that the development of industries in Leningrad will create such a large demand for energy that even the Volkhoff hydro-electric works will be unable to satisfy it. In the circumstances the question has been raised of constructing a new station based on the use of peat from the marshes, and a committee of the State Planning Commission has paid a visit to the locality with a view to the selection of a suitable site for the station, which is to be completed in 1927. Moreover, the committee has decided that it is also necessary to enlarge the capacity of the existing stations, particularly the second station, which is situated in the centre of the industrial district of Leningrad.

The Volkhoff Station.—The State Planning Commission estimates that the expenditure on works at the Volkhoff station from April 1st, 1925, down to its completion will amount to 27,000,000 roubles, of which 21,500,000 roubles is to be provided in 1925-26.

The Textile Machinery Exhibition, 1925.

A Review of the Electrical Features of the Manchester Show.

(*Concluded from page* 677.)

T. Broadbent & Sons, Ltd.

Besides the well-known centrifugal clutch some hydro-extractors were on view, including one 48-in., directly-suspended, electrically-driven model. The motor revolves round the centre spindle and drives through a centrifugal clutch, thus being protected from damage, and resulting in a much reduced starting current being required.

Root Co.

This American firm showed counting devices for various purposes, particularly textile, the motors and control gear provided for them being of Metropolitan-Vickers manufacture.

Hindle, Son & Co., Ltd.

This company showed a 25-ton electric baling press with a d.c. reversing drive, series-wound, which automatically varies the speed according to the work being done. An overload circuit-breaker is provided in order that the motor may be stopped on maximum pressure being exerted, and it is also automatically brought to a standstill at the top and bottom limits of the travel. About 100 bales, it is claimed, can be pressed for one kWh of electricity. The presses are also supplied for a.c. circuits.

Roto-Sign Co.

On the stand of Messrs. J. H. Fenner & Co., Ltd., leather belting manufacturers, an electrically-operated moving sign supplied by the Roto-Sign Co. showed how this form of publicity may be used in an exhibition without any feeling of ostentation.

Metropolitan-Vickers Co., Ltd.

Of its two stands one was utilised as an office and the other for the display of a 680/1,000-b.h.p. turbine designed to run at 4,500 r.p.m. The low-speed shaft of the gears runs at 500 r.p.m., and the set was made for driving direct the main shaft of a mill in India. In addition, the firm had motors and control equipment running on many stands, including those of T. Broadbent & Sons (hydro-extractors), Universal Winding Co. (textile winders), Mellor, Bromley & Co. (hosiery machinery), Hoffmann Manufacturing Co., Carver Textile Patents, Ltd. (patent electromechanical loom, described last week), and Oscar Kohorn & Co. (artificial silk machinery).

Belliss & Morcom, Ltd.

A high-speed engine of the enclosed type was shown with the front doors removed so that the working parts could be seen. The engine was driven round slowly by a 2-h.p. "Lancashire" motor operating through Wallwork worm gear and a Hans Renold chain drive. The high- and low-pressure cylinders are 14½ in. and 21 in. diameter, respectively, with a piston stroke of 10 in., and exert 265 b.h.p. at normal full load and 330 b.h.p. overload, operating with steam at 150 lb. pressure and exhausting at 15 lb. back pressure to the heating system of the works in which it is to be installed. The engine runs at 425 r.p.m., and can be arranged to drive either an electric generator, or a pulley for rope transmission; it has been sold to the Calico Printers' Association.

Andrew Machine Construction Co., Ltd.

In addition to a working exhibit of patent humidifying plant, an electrically-driven air cleaning, purifying, and ventilating machine was shown which provides a method of disinfection and is easily portable.

Laminated Gears, Ltd.

A train of gears reducing, by means of five reductions, from a motor speed of 715 r.p.m. to 1½ r.p.m.; also a bedplate carrying ball-bearing motor and backshaft with laminated gears reducing from 705 r.p.m. to 143 r.p.m. There was also a speed-increasing set with the high-speed shaft running at 6,400 r.p.m.

Daniel Foxwell & Son.

The Kent patent electrical indicator, when fitted to an automatic cloth guider, enables one operative to mind more machines single-handed than at present on account of the fact that, should any fault occur in the selvedges of the cloth going to any machine, he will be immediately notified of it in an audible manner. If the selvedge of the cloth, or any portion of them, should for any reason travel beyond a predetermined distance away from their true line, the electric circuit is closed, thus causing the bell to be rung. A different tone for each machine enables the operative to know exactly where the trouble is.

Joseph Stubbs, Ltd.

These well-known textile machinists had a number of winders for textile use driven by electric motors supplied by Electromotors, Ltd. Each machine was driven by an individual motor either by chain drive or spur gearing.

Markt & Co. (London), Ltd.

This company showed for the first time in this country the new Veeder magnetic counter, fig. 7. This is operated by electromagnets, and with an 80-ampere-hour storage battery with the time of contact of the commutator adjusted to the minimum required to operate properly, the small U magnet counter should run to 5,000,000 and the large magnetic counter to 10,000,000 counts on one charge. The magnetic counter is essential under conditions where it is desirable that the counter be placed at some distance from the machine on which the count is to be taken. A number of counters can be grouped together in a central convenient place. It is also desirable where articles counted are very small, or thin, or light in weight, making it difficult to count them by mechanical means. Because no extra contact device need be provided, the magnetic counter is especially useful in conjunction with other devices already electrically operated, where it is desired to know the number of times these devices are started or stopped, such as lifts. In such cases, the counter could be connected in shunt or in series with the device in question.

The mechanism which moves the number wheels in counting has two motions: one, forward under the influence of the

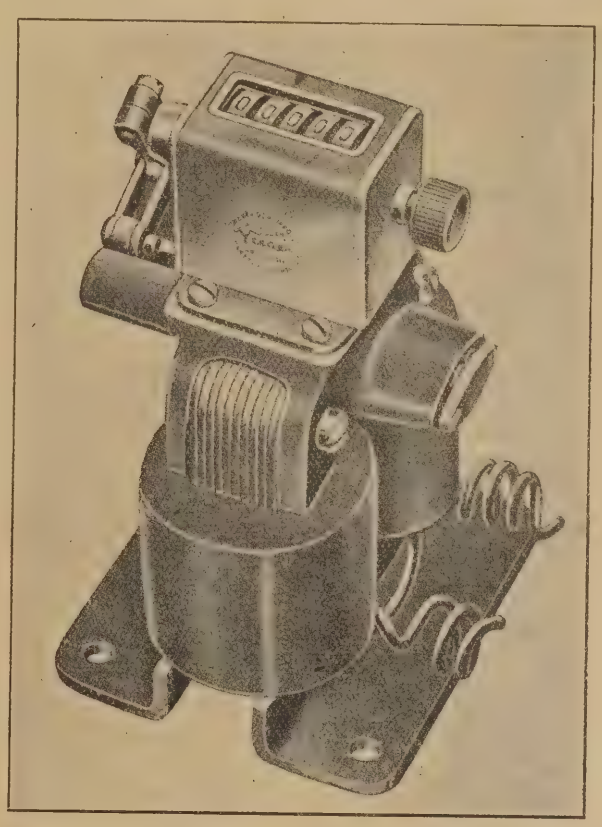

Fig. 7.—"Veeder" Magnetic Counter.

electro-magnets when the contact is made and which moves the counting wheel; and, secondly, the return movement under the influence of a spring which returns the mechanism and completes the cycle. Should the time of contact be too short, the first movement will not be completed, and if there is not sufficient time between breaks (when the current is off) the return movement will not be completed before again starting forward under the force of the magnets.

Although the counter may be placed in a detached position relative to the machine upon which the count is required, it is necessary to provide some mechanical device which will close and break the electrical circuit which operates the counter. The "wipe" style of contact can be used as a revolving, oscillating, or sliding member, and may be a simple contact of metal on the moving member coming in contact with a spring attached to a non-moving member. Another form would be a commutator of one bar on the circumference of a drum made of non-conducting material, with a brush of metal or carbon. The wipe contact has the advantage that, due to wear of the contact surfaces, ordinary material may be used, as any corrosion due to sparking tends to be worn away by the friction between the parts. The "touch" contact should be used where a very slight or short movement only is available; the contacts must be of suitable material, such as iridium, platinum, or tungsten, that will not corrode as a result of sparking on the break of contact. Care must be exercised to obviate double con-

tacts due to vibration or other causes, in which case the counter would register one count for each make and break, whether caused by intent or accident.

Singer Sewing Machine Co., Ltd.

This company had on view a single power bench fitted with a high-speed enclosed-type of electric transmitter to ensure the sewing machine being driven at maximum speed. Another interesting exhibit was the two-needle lock-stitch machine fitted on a special bench, complete with guide rail, clip, slide and weight, for automatically guiding the cloth to the needles. The machine makes the overlap, or imitation hand-pasted, seam now in use at bleach, dye, and print works, and is driven by a small electric motor.

Mr. George Ellison.

This display included a range of low-pressure ironclad air-break and oil-break control gear for industrial motors. Special attention was drawn to the new draw-out type switchboard for currents up to 1,200 amp. at 600 volts; also suitable for 3,000 volts and 200 amps. Some good contracts have been carried out in Lancashire lately, amongst which might be mentioned the Black Pits Mill at Rochdale, where the installation was erected jointly with the English Electric Co.; Thos. Warburton's Waste and Weaving Mill at Haslingden, where ironclad low-pressure switchgear has been installed in the new extensions, and also control gear for a 250-h.p. motor for the opening machinery and two 100-h.p. and 75-h.p. motors; also two 1,200-amp. incoming panels for the electricity department of the Accrington Corporation.

Henry Lowe & Sons, Ltd.

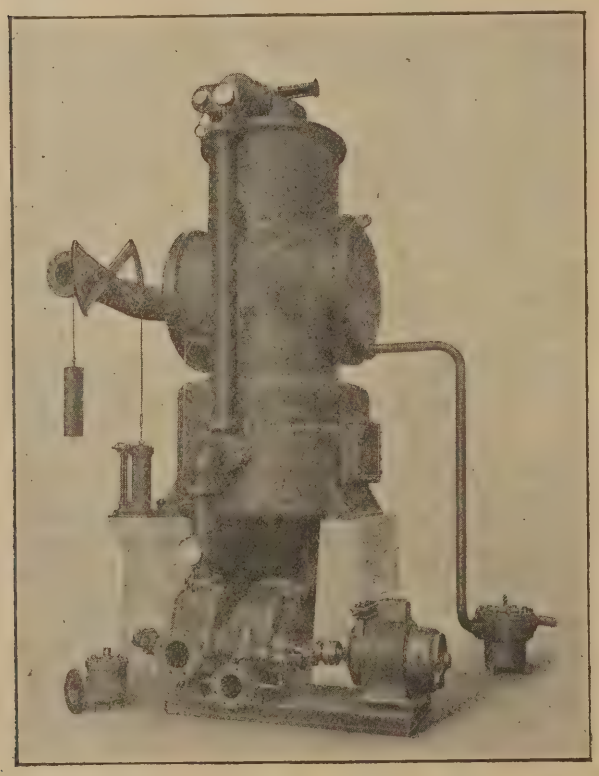
This firm exhibited an electric lift head gear. The winding gear is of the worm type and is self-sustaining; it comprises an electric motor, electro-mechanical brake, worm reduction gear and winding pulley, all mounted as a complete unit. On this stand was also shown by Mr. T. Simpson a patent smoke burner for fitting to boilers. No alteration is required in the fire bars, bridge work, or flues, and no drilling of holes in the boiler is required. The claims made are that no cold air is allowed to reach the fire and no black smoke is emitted.

Moore & Avery, Ltd.

This company, represented by Mr. James Witnell, exhibited a patent automatic warp thread reaching-in machine fitted with a small electric motor of about ¼ h.p., which can be driven from the electric light mains if desired.

W. H. Allen, Sons & Co., Ltd.

This was one of the most interesting stands in the whole exhibition; a great deal of machinery had been brought to the stand, and prominent amongst it were a 1,500-kW high-pressure steam turbine and a 1,000-kW geared steam turbine



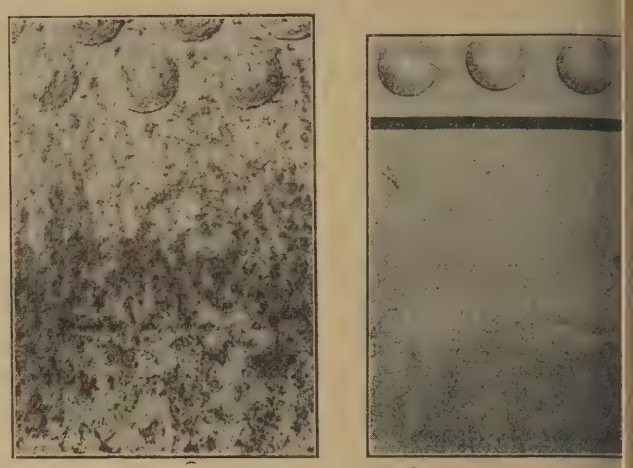


Fig. 8.—"Allen" Boiler Feed-water Deaerator.

for coupling direct to rope pulleys for driving textile mills. Apart from these, however, there were one or two matters of peculiar interest to electrical engineers. First, there was a model (one of four) of a surface condenser with 45,000 square feet of cooling surface for a power station in Japan. The advantage of the physical method of deaeration of the "Allen" deaerator (fig. 8), is that all gases in solution in the water are removed to the same extent in relation to their solubility, not oxygen only. In this plant violent ebullition and foaming ar created in the water by flashing; the water is shattered int minute particles, which allow of the complete liberation of th gases contained. The flashing is accomplished by heating th water under vacuum and flashing it on a surface of high tem perature. The apparatus is constructed in a self-contained un with which very high degrees of deaeration are being ob tained. The lower part contains a bank of steam-heated tube over which the water falls. Preliminary deaeration takes plac in the upper part, where the incoming water is heated to boi ing point by the vapour rising from the hot tubular surfac below. This hot surface acts like a pressure flash-boiler, an when the falling heated water comes in contact with it, it i

(A) Serious Pitting, without Deaeration. (B) No Pitting, with Deaeratio

Fig. 9.—Results of Deaeration.

repeatedly flashed as it falls from one tube to another on it way to the outlet, and the contained air thus liberated rise and is withdrawn at the top by a small steam-operated ejecto which maintains a vacuum in the deaerator corresponding t the temperature of the heated water. A float contained i the base of the deaerator controls the inlet of the water i accordance with the requirements of the boiler feed pump.

A large number of deaerators are said to have been manu factured and are now running in various power stations; i some plant the water entering them contains from 5 to 6 c.c of oxygen per litre, but the deaerators are claimed to be re moving 99 per cent. of that originally contained. Fig. 9A is view taken inside the top drum of a boiler which has bee run for ten months on undeaerated water. The serious pittin action that has taken place on the drum is clearly illustrated Fig. 9B is a view taken in a similar position on a similar boile in the same power station, but supplied for nine months wit deaerated water.

Universal Winding Co.

Whilst it might not be thought that the very large stan of this company would provide matter of especial interest t electricians, reference should be made to the coil winders pro duced by this firm. The "honeycomb coil," renowned i radio circles, was a product of this firm's No. 84 machine Another produces coils in "spool-wound form," each convolu tion of wire lying parallel and closely adjacent to the next on without any of the turns crossing. One of the latest machine winds the wire in the spool-wound form and at the completio of each layer injects a piece of prepared insulating paper be tween the finished and the new layers. This operation con sists of completely encircling the coil with the paper and cut ting it off in time for the next convolution of wire to wrap it i place. The machine winds coils from ½-in. inside diameter t 2-in. outside diameter on one type, or 9-in. diameter o another, and from ¼ in. to 2½ in. in length at a speed of from 200 to 1,200 r.p.m.

Samuel O'Neill & Sons, Ltd.

This exhibit consisted of paper tubes as used in the wireless electrical, and explosive trades, in addition to the wide rang of products for the textile industries.

General Electric Co., Ltd.

A comprehensive display of standard products as applied t textile drives included a 5-h.p., 400-volt, 950-r.p.m. self-con tained driving unit, star-delta starter, and motor fitted with centrifugal clutch, suitable for driving spinning, doublin frames, &c.; also a 15-h.p., 3-phase, 50-period, 400-volt, 960 r.p.m. motor with dustproof enclosed slip-rings, suitable fo line shaft drives, and a number of small loom motors. Th lighting was arranged in such a manner as to demonstrat the different kinds likely to be required in a textile mill, an there were also samples of cables, fittings, &c., suitable fo textile mills and dye-houses.

Amongst the recent contracts dealt with by this firm is th electric driving of the Osborne Spinning Mills at Oldham This is one of the oldest spinning mills and the installatio has effected considerable improvements in the lay-out of th premises. A new sub-station has been erected and supplie with 3-phase current at 6,600 volts, 50 cycles, which is trans formed to 400 volts. Three motors are installed in the tower of the Witton 200-h.p. slip-ring type. There are also tw 75-h.p. slip-ring motors in the blowing and card rooms

quipped with pipe ventilation on account of the dust in the mosphere. This installation is a good example of the manner i which the electrical drive can be put into premises con-ucted with very different intentions and shows the ease with vhich difficulties can be overcome.

Other Exhibits.

The whole of the machinery on the stand of Messrs. Asa, Jes & Co., was driven by electric motors with a centrifugal ɔtch on each shaft. The motor was coupled direct to the iving shaft of the ring spinning frame, the roving frame ɔd others being each driven through a pair of laminated ɡars. The motors were supplied by Messrs. Mather & Platt, ld., the control gear by George Ellison, the clutches by Thos. Joadbent & Sons, and the gears by Laminated Gears, Ltd. Messrs. Platt Bros. & Co., Ltd., exhibited amongst other pro-ɔcts a power loom, calico type, fitted with the Whittaker ɔtomatic weft replenishing attachment. The detector stop ɔtion was by Mather & Platt and the loom was driven by a ɔall independent motor lent by the English Electric Co., ɔrough a Renold chain and sprocket reducing gear. The "Wallace" centrifugal clutch manufactured by the Hele Shaw Jtent Clutch Co., was also demonstrated. Messrs. Geo. Int, Ltd., had a good display of their products, but the tests ɔ the new "Telerecorder" are not yet quite completed and ɔy were unable to show this new electrical steam-flow dis-ɔit recording instrument. Other textile machine makers em-ɔyed electrical power on their stands.

Conclusion.

Besides the English exhibitors, French, Swiss, Dutch, Spanish, Czecho-Slovakian, and German firms (including Siemens-Schuckert, Ltd.), displayed their wares. It is unlikely that any exhibition in the provinces could have been more successful than this one has been so far as one can judge at present. Not only have an immense number of inquiries been received, but actual orders have been booked on a substantial scale. The attraction of the ordinary public was very great and on the Saturdays the crowds were rendered a little unpleasant. On one day about 13,000 people came to the Hall. It might be thought that this was not in the best interests of business, but it must be borne in mind that a large number of these people were the operatives using the machines and as such were welcomed by the exhibitors. During the other days of the week the exhibition presented an animated appearance from morning until night and the many foreign and home buyers had ample opportunity to study the machinery displayed. All the electrical firms were enthusiastic as to results, and whilst it might appear in this survey that we have devoted too much space to matters other than purely electrical, we would say that in an exhibition such as this, one of the most prominent features is the plain fact that electricity is there to serve every requirement of the machinist. It is an integral part of textile machinery and a knowledge of the latter is absolutely essential to those hoping to extend the use of the former.

Scientific Shop-Window Illumination.

Commencement of the E.D.A. Conferences.

The 1925-26 series of conferences arranged by the British Electrical Development Association in the London district was ɔened on October 15th, in the Lighting Demonstration Jreau of the Electric Lamp Manufacturers' Association, at ɔvoy Hill, when Mr. W. E. Bush, of the E.L.M.A., read a per on "Selling Better Lighting to the Shopkeeper." His ,per was repeated at another meeting on the following even-ig. Special facilities exist at the Bureau for demonstration, l means of which Mr. Bush was able to illustrate the differ-ɔce between good, bad and indifferent lighting, with different ɨensities and lay-outs. Mr. C. W. Sully (Chairman of the JL.M.A.) presided.

Mr. Bush opened his lecture with a reference to a survey, ɔently undertaken by the E.L.M.A., of retail shops in the ɔuntry, which had provided valuable information as a basis f· a national sales campaign which was being conducted by tɜ E.L.M.A. One of the things indicated by that survey was tɑt two-thirds of the shop windows of this country were

Fig. 1.—A Typical Shop-window Reflector.

ɨing modern lamps with equipment designed a quarter of a ɔntury ago. Whereas shopkeepers were guided by skilled ɔsigners with regard to their fittings and furnishings, in the ɜatter of lighting they had been their own architects, and ld merely substituted new lamps for old. The result was ɜare, hard shadows, discomfort to purchasers, and other evils, ɑd considerable damage was being inflicted upon the elec-ɔical industry by exhibiting to millions of prospective con-ɔmers the crudest examples of electrical service. Judged by ɔod modern practice, only 17 per cent. of the shop windows ɔ the country were well lighted, and the position was little ɔtter in shop interiors. Mr. Bush deprecated the neglect of ɔod lighting on the score of cost, and emphasised the neces-ɔy for bringing home to the shopkeeper the fact that good ɔhting was good advertising at very low cost. To indicate e enormous market awaiting the industry in this connection, ɔ said that to raise the standard of shop lighting in this ɔuntry even to a conservative basis a minimum of five mil-ɔns sterling must be expended. The necessity for electrical ɔntractors to adopt good window lighting before they could ll it to others has often been raised at these conferences, and in this connection Mr. Bush said the survey mentioned showed that on an average contractors' shops and supply undertakings' showrooms were worse than retail shops. If an electrical showroom were not suitable for making a display, he suggested that the supply undertaking and the contractors jointly should make arrangements with a shopkeeper to light his window as a permanent exhibit during the winter months.

Appealing for simplicity in submitting specifications, he pointed out that the standardisation of equipment and lighting practice rendered it unnecessary to spend time in lengthy calculations to design good installations, or to trouble shopkeepers with engineering technicalities. He recommended the following specifications for first-class lighting:—*Window lighting.*—Specially designed shop-window reflectors fixed close to the ceiling, fitted with 100-W gasfilled lamps, spaced 1 ft. apart for windows in main thoroughfares, and 2 or 3 ft. apart in side streets. *Shop lighting.*—Totally-enclosed dust-proof fittings 10 ft. apart, fitted with 200-W gasfilled lamps.

In a reference to the value of lectures and demonstrations to trade organisations throughout the country, he referred to literature published by the E.L.M.A., which included a specially-prepared lecture entitled "Light and the Shop-

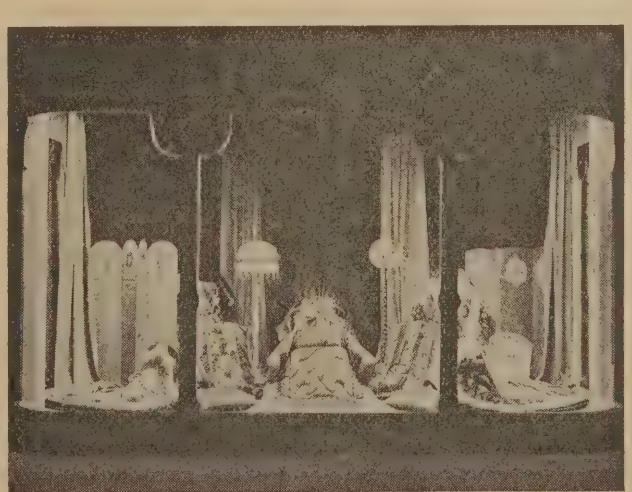

Fig. 2.—An Example of Good Shop-Window Lighting.

keeper," in booklet form. A model shop had also been prepared, by means of which every conceivable lighting system could be demonstrated in an appropriate setting. Mr. Bush appealed for co-operation between all sections of the industry, and for concentration on one aspect of electrical service at a time; the E.L.M.A had commenced by concentrating on shop lighting. There did not appear to be a saturation point until daylight levels were reached, and the 1925 standard would be far surpassed 10 years hence. He could foresee the time when super-lighting would be installed in the windows of all progressive stores in order to overcome daylight reflections.

Discussion.

In the ensuing discussion, Mr. James Edgar (South Shields) referred to lighting shop windows from outside, which, he considered, showed up the goods in the window less effectively than lamps installed inside. He also suggested that the E.D.A. and E.L.M.A. should impress upon the public the fact that supply authorities were anxious to advise them gratuitously with regard to their installations.

Mr. Blake urged greater confidence between the various sections of the industry in the work of raising lighting installations to a reasonable standard.

Mr. Herbert drew attention to the many small contractors in the country who had not sufficient knowledge to enable them to design an efficient installation, and who cut down specifications in order to reduce the price and secure an order; these contractors should be compelled to pass an examination to prove their ability.

Mr. R. C. Hawkins (E.L.M.A.) described some of his experiences as an investigator in connection with the E.L.M.A. survey. Most shopkeepers he had found to be sympathetic, but he agreed that many were afraid to ask the supply authority or a contractor for advice, for fear of being charged for it. They had been greatly impressed by demonstrations.

Mr. E. Boys (North Metropolitan E.P.S. Co.) asked for definite suggestions as to how to tackle the problem of shop lighting in bulk. He also referred to the case of a shopkeeper who, having been induced to display his goods in the North Metropolitan Co.'s showroom (the lighting being suitably arranged) had given an order to the value of £100 for the improvement of the lighting of his shop.

Mr. Abell referred to the difficulty of getting shopkeepers to dress their goods back from the glass of the window, and pointed out that in those cases outside lamps must be used. He asked whether the practice of using sprayed lamps without reflectors in windows had been successful.

Mr. Mason spoke of the importance of overcoming glare, and the consequent necessity for the salesman to have a scientific knowledge of illumination.

Mr. Houghton said it was valuable to establish one or two shops with properly lighted windows in a district, and to invite shopkeepers to inspect them.

Mr. Hayward considered that the cost of electricity should be reduced; some shopkeepers had reverted to the old standards on the score of cost.

Mr. A. Jones said that the cost of electric lighting was very small as compared with the other costs incurred by shopkeepers.

Mr. Bush, in reply, said he did not think outside lighting was good for the shopkeeper, or, ultimately, for the electrical industry. He would prefer that the electrical industry should go to the shopkeeper and offer advice. Though some existing installations could be improved by substituting sprayed lamps for those now used, he preferred the use of clear lamps in proper reflectors. There was no need to apologise for costs, but to justify them, because good lighting was positively business-building.

The Second Conference.

Mr. Bush's lecture was repeated on October 16th, when J. Y. Fletcher (G.E.C.) presided in the absence of Sir H Hirst, Bart., through indisposition.

The Chairman said that in addition to the lighting bure which had been established recently in Glasgow and Newca (Electrical Review, October 23rd, pp. 672-3), there w plans for opening a similar establishment in Manchester, it was hoped also to establish them in Leeds or Bradford Birmingham, and in Cardiff. For towns in which s bureaux could not be established, an attractive travell bureau was being developed.

Mr. C. Hayes advocated prepayment meters for electri consumers, as well as assisted wiring schemes.

Mr. Howard Smith agreed to the establishment of defer payment wiring schemes if the supply authorities gave work to the contractors and did not carry it out themsel He advocated the supply of electricity to shopkeepers a reduced rate.

Mr. H. F. Simon said that invention had gone ahead fas than the education of the public. He also mentioned the va of good lighting with regard to health and efficiency.

Mr. H. J. Adams said that very often owners of large bu ings which were leased as offices were opposed to impro lighting owing to the fact that they leased the offices a figure which was inclusive of lighting, and wished to k the cost down. An effort should be made to educate the own of such buildings.

Mr. L. E. Buckle said that competition between groups shopkeepers, rather than individuals, had proved valuable

Mr. J. C. Chaytor said that, in his experience, the pract of affording facilities to shopkeepers to display their goods electricity showrooms had proved valuable, and had convin them of the value of good lighting.

Mr. H. Marryat (Messrs. Marryat & Place) said it w important to standardise the position of the filament in a lan because otherwise, if it were fitted into a standard reflec the focal distribution was upset.

Mr. H. T. Young (Messrs. Troughton & Young) advoca the policy of giving a shopkeeper a good installation on proval if necessary, because of its advertising value to electrical industry. A shopkeeper generally kept such installation, and paid for it.

Mr. H. G. W. Haslett referred to the difficulty aris through trying to fit a standard lamp to a fitting which w not standard, and urged co-operation between lamp and fitti makers.

The Chairman, who was asked whether the low consum tion of lamps in this country as compared with others was result of British lamps having a longer life, said that British lamps were probably a little better than the best ma in other countries, but, in view of the interchange of techni experience throughout the world, there would not be a gr deal of difference in the future.

Mr. Bush, replying to the discussion, covered many of t points which he had dealt with in his reply on the previo evening. He agreed that development in the industry w going ahead faster than the education of the public, and su gested that the fault probably lay with the sales section of t industry.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A Portable Electric Saw.

We have received some particulars of a new portable electric saw, manufactured by the Electro-Magnetic Tool Co., of America. The "Speedway" saw, fig. 1, weighs only 15 lb. and is equipped with a universal motor suitable for operating on either a.c. or d.c. supplies. It is fitted with a flexible cable and standard adaptor. It is claimed that the saw is capable

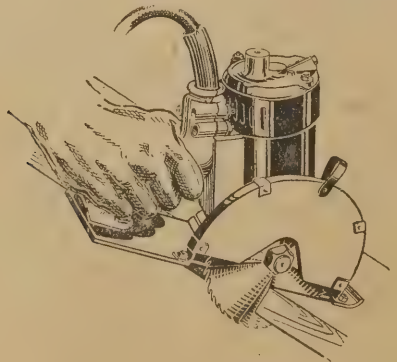

Fig. 1.—The "Speedway" Saw.

of being used for practically any work within the scope of a hand saw, and is equally effective in cutting bone, wall-board, plymetal, hard rubber, &c. A quick make-and-break trigger switch is located in the handle. The saw blade is adjustable by means of a single nut and is covered by a dust shield. The device is suitable for a 6-in. or 7-in. blade. Messrs. The B.E.M. Patents, Ltd., 100, Victoria Street, London, S.W.1, are the sole concessionnaires for the sale of this saw in Gre Britain.

"Star of Eve" Reflectors.

This is a new range of reflectors for various purposes pr duced by Mr. E. Rutherford Palmer, 40½, Bristol Street, B

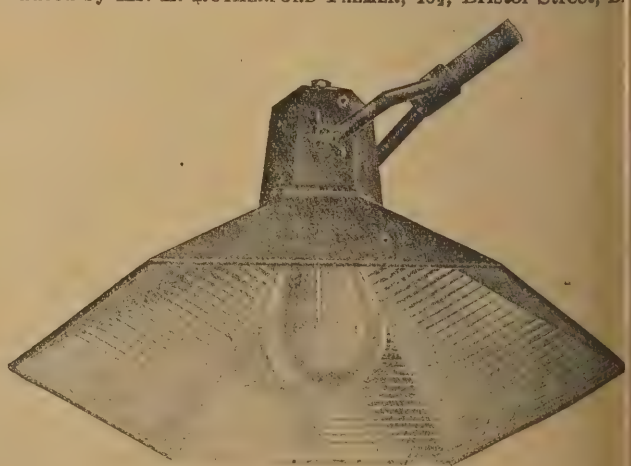

Fig. 2.—Exterior Lighting Fitting.

mingham. These reflectors consist of a body of heavy she metal lined inside with a fluted mirror split into sections give a correct distribution. By the use of a special enamel th mirrors are rendered impervious to fresh or salt water; and th

...ig is such that a broken mirror can easily be replaced. ...h galleries, in the case of reflectors for interior lighting, are ...ri..lated and made in two parts. This allows the body of ...reflector to be fixed when the holder has been wired. With

Fig. 3.—Interior Lighting Fitting.

...exterior lighting units a trunnion arm is supplied (fig. 2) ...iable the light to be directed as required. Fig. 3 illustrates ...nterior lighting reflector designed to take a 60-W lamp. ...standard finish is black enamel, but a number of art ...nel finishes are available.

An Improved Reducing Valve.

...ESSRS. THE STEAM FITTINGS CO., LTD., West Drayton, ...Illesex, have recently placed on the market an improved ...n pressure reducing valve known as the H.M. steam relay ... reducing valve, fig. 4, which is designed to reduce from ...able boiler pressure, independent of variations in steam con...ption, to a constant lower pressure. The valve has an adjust... operation which ensures a free and full lift. It is free, it ...aimed, from shock and hammer action, and works equally ... with saturated or superheated steam. It contains single ... main and auxiliary valve cones guided by means of a ...n. A balancing piston in a cylinder is placed above the ...s. A regulating and a safety valve are installed on the ...er cover of the device, and its lower cover is fitted with a ...-off hand spindle. The regulating valve is under the con... of a small diaphragm, the pressure on which is counter...d by a spring that is adjustable by a regulating screw ...n lock-nut. The high pressure steam reaches the chamber ...re the operating piston through the wall passage and the ...lating valve (left). The piston loading pressure in the ...mber, when the limit for which the spring pressure on the ...phragm is reached, lifts the diaphragm itself and the regu...ng valve so that, owing to the throttled admission, a con...t loading pressure is maintained in the chamber. The ...ing pressure holds the operating piston down and therefore ...h main and auxiliary valve cones open until a pressure is ...hed on the low pressure side of the valve and therefore in ...h chamber below the operating piston, which very slightly ...eds the loading pressure above the piston. In conse...nce of the small difference in pressure on the two operat...n piston surfaces, the piston itself is lifted and the valve cone ...es. The high pressure is thereby shut off from the cham...e above the valve cone, so that the pressure in it drops to ...s prevailing in the low pressure space of the valve (exit) ...ough the leakage space between the balancing piston and ...guide cylinder. The main and auxiliary valve cones are ...loaded by the high pressure from below and are moved in ...closing direction.

If the steam consumption should be interrupted the high pressure will hold the main and auxiliary valves tightly closed so that the pressure on the reduced pressure side cannot creep up. During operation the low pressure, in consequence of the steam consumption, has a tendency to drop. With constant consumption the pressures above and below the main piston (top) become equalised and the main valve cone remains stationary. It is claimed that this reducing valve is suitable for all steam pressure reduction down to 15 lb. per sq. in., whether the ratio of reduction is large or small.

A Device for Hand Pump Conversion.

It is often desired to have a ready means of converting the ordinary domestic hand pump into an electrically driven pump in country houses where an electricity supply is available. To meet this requirement Mr. A. W. REEVES, 3, Edmund Street, Birmingham, has produced the device illustrated in fig. 5. The pump rod is operated by a concentric gear worm driven by an electric motor.

The normal speed of the pump is 70 strokes per min. and the motor may be switched straight on to the main. The mechanical efficiency is claimed to be very high, owing to the device being fitted with ball bearings, and the worm and the worm-wheel being cut with great precision. The diameter of

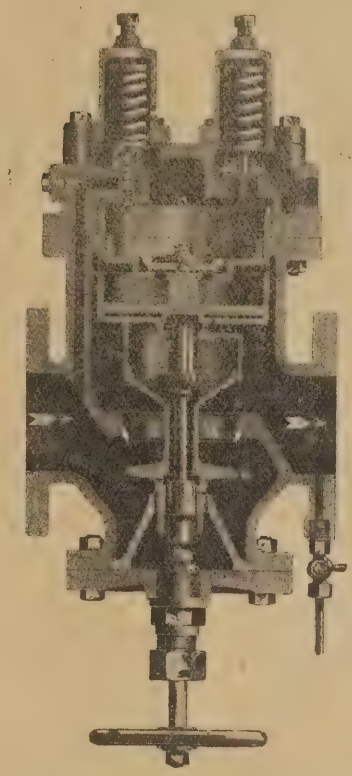

Fig. 4.—Relay Reducing Valve. Fig. 5.—Pump Conversion Device.

the base flange varies from 8 in. to 10 in. The method of attachment makes it possible to fix the device with its base flange at, or above the ground level, or in the event of the pump which it is desired to convert having an above ground delivery, the device can, of course, be fixed to suit this case.

In using the attachment the pump stroke is shortened by one half of that obtained when the pump is worked by hand, and the inertia forces become negligible. With an attachment 18 in. in height overall, it is claimed that 100 strokes per min. can be run with the stroke as short as 4 in.

Imagination in Engineering.

By FRANK J. MOFFETT.

(*Abstract of Chairman's Address;* SOUTH MIDLAND CENTRE *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

...GINATION is commonly associated in the mind of the man in ...t street with those possessed of an artistic talent—poets, ...inters, dramatists and such like. The engineer is not as a ...e credited to the same extent with this power. He is con...ered to be a matter of fact, sensible sort of being with whom ...ts slightly absurd to associate any imaginative characteris...i.. I fancy that even engineers themselves are to a certain ...ent guilty of this attitude, and I trust that in the course of ...r remarks I may do something to modify it.

...n the most general acceptation of the term, imagination ...y be defined to be the power or process of producing mental ...ctures or ideas. When the train of ideas simply reproduces ...l image or picture of past experience, or phenomena without ...y material alteration, the process is called "reproductive ...agination". When by a process of selective combination of ...as a new picture is produced we have creative imagination. ...eative imagination is accompanied by many emotions—...asure or pain, hope or depression. Anyone who has made ...n a minor discovery knows the fine glow of satisfaction ...ich results from it, the joy of success or perhaps the dejec...n of failure. It is a well-known fact that many inventors in spite of continual failure to achieve success, refuse to be daunted and persist in their efforts, though these are unrewarded. An illustration of the power of thinking by analogy is the discovery of the Gothic style of architecture. We can imagine an architect setting out to find some improved design for the construction of churches and cathedrals and being struck by the resemblance of an avenue of trees meeting overhead to a beautiful roof. This I believe was the origin of the wonderful Gothic nave in some of our cathedrals. We all, I fancy, are in the habit of saying at times when faced by some knotty problem, that it is better to sleep on it. This means nothing but that we are deliberately giving the unconscious element an opportunity to come into action. I am so firm a believer in the value of the unconscious element that I much prefer when engaged on any specially difficult work, to call a halt for some few days and allow my mind to put in what I may call its automatic work.

In the realm of scientific discovery Michael Faraday stands out as one of the great figures, and it is very fitting to refer to his methods when addressing a gathering of electrical engineers; imagination played a great part in his achievements.

In a note on the margin of one of his papers he warned himself to be practical: "I must keep my researches really experimental and not let them deserve anywhere the character of hypothetical imaginations."

Tyndall in his address on "Faraday as a Discoverer" says: "When an experimental result was obtained by Faraday, it was instantly enlarged by his imagination. In virtue of the expansive power which his vivid imagination conferred upon him, he rose from the smallest beginnings to the grandest end." Faraday admitted that he was no lover of mathematics and pleaded almost pathetically in a letter to Clark Maxwell for some easier mode of expressing scientific ideas. I feel sure that many will sympathise with Faraday in his appeal. Surely many of the papers read before this Institution could with advantage leave out the pages of symbols and substitute, as Faraday says, common language.

In his aversion to the use of mathematical methods, Faraday is a striking contrast to Newton, whose great work in the discovery of the laws of motion and of gravity may, however, be said to be almost entirely the achievement of his wonderful mathematical imagination. In commerce again there is a great field for the imagination. In fact, the stories of the development of some of our great commercial enterprises read like romances. I consider that the greatest discovery Ford has made is the principle of service. I have referred to Faraday and Newton in scientific discovery and to Ford in commercial discovery. All of us, in whatever department of engineering we are engaged, require a creative imagination.

The layout of a power house and a system of distributive mains, the manufacture of machinery for the generation and transforming of electrical energy, the design of switchgear, the installation of electric power and light, the provision of telegraph, telephone, and wireless communication, the development of furnaces and welding appliances—all the wide range of constructive problems which confront the electrical engineer, involve the faculty of discovery and invention in a greater or less degree. The field open to the electrical engineer with creative imagination is enormous. Take the steam-driven generating station: it is well known to all that the overall efficiency from the heat energy in the fuel to the electrical energy at the switchboard is dismally low, not more than, say, 10 per cent. in the average station and 20 per cent. in the most recent super-station. Surely there must be some means of reducing this enormous waste of heat energy, from 80 per cent. to 90 per cent. of the total energy in the fuel. On a small scale a much higher overall efficiency has been obtained by the utilisation of the waste heat in the exhaust. No remedy, however, is yet forthcoming for the large station. The lead accumulator has held the field almost without threat of competition for the last 30 or 40 years. It is the weak link in any scheme which involves the storage of energy, since it has an extremely low capacity compared to its cost and weight, and its life even when treated with the utmost care is very short. The question of atomic energy may be looked upon as a subject which concerns the physicist rather than the electrical engineer, but at any moment it may become of vital importance to the latter. Shall we ever be able to tap this energy? Sir William Bragg says: "I am of opinion that atom energy will supply our future need. A thousand years may pass before we can harness the atom or to-morrow might see it with the reins in our hands. That is the peculiarity of phy —research and accidental discovery go hand in hand.

I have suggested one or two fields in electrical engineer where there is unbounded scope for the creative imaginat but I am sure everyone will agree that there is practically limit to the number of scientific problems awaiting solut Imagination is possessed in some degree by all normal pers I would venture to claim that the average engineering signer's imaginative power is above the common level, but view of the nature and scope of his work I consider that development of this faculty has not kept pace with his te nical powers.

In electrical apparatus in particular there appears to b boundless field for imagination, especially in connection w appliances in which means have to be devised to circumv the unconscious human tendency to commit suicide. The signer must, in fact, bring himself to realise that the desire gratify the sense of touch has not yet been eliminated e in the trained electrical attendant. To still greater leng must the use of the imagination be carried in the design apparatus for domestic use. The designer must, by full use his imaginative faculty, suppress for the time being the stincts of his training so as to adjust his focus to see, say griller switch through the eye of the average cook. In sphere is the need for imaginative enterprise more immediat apparent than in industry where the search for an explanat of trade depression is engaging so many minds. Lack of im ination in catering for foreign needs and conditions may be the principal course, but I suggest that it may be a stro contributory factor in the decline of overseas trade: the ti has passed when our wares will sell on the strength of th place of origin. In the conduct of human relationships t necessity for what may be termed the sympathetic imaginati is truly enormous. The relations between employers and e ployed are at the present time in a very strained conditi I suggest that one of the principal obstacles in the way o solution of many of our difficulties is simply lack of imagi tion on both sides.

What are we doing to encourage the growth of the imagi tion? The child is father of the man, and we needs must st with the child.

Material, and it may be inspiration and encouragement, m be given, but the inventive mind can only work when free a untrammelled. The course of the school is obvious. In constructive work it should leave as free a hand as possible the planning: should welcome originality even if it spoil mat rial and should give to those who show they can imagine ne constructions, generous opportunity to carry out their practic ideals. In the majority of public schools the zeal for sport every kind is tremendous. Is it not possible to awaken simil zeal for the pursuit of knowledge?

As a final word I would say that imagination is one of t greatest faculties with which we are endowed. If we give fu scope for its exercise and have the courage to follow its le we shall have added power to deal not only with the technic problems which confront us as engineers, but also with t wider problems of human relationships to the solution which engineers can make valuable contributions.

The Supply of Electricity by the Gas Industry.

Some Statistics, and a Gas Engineer's Opinions.

In his presidential address to the Scottish Junior Gas Association (Western District), on October 10th, as reported in the *Gas World*, Mr. Robert Gray, assistant manager, Hamilton, said that within recent months they had read and heard a great deal regarding the development of the electrical industry; greater prominence had been given to this industry within very recent times than they had before experienced in its whole history. The quantity of coal consumed in the generation of electricity in this country was about 7,500,000 tons per annum, or about 4.5 per cent. of the total coal consumption of Great Britain. It was an admitted fact, however, that less than 20 per cent. of this amount was converted into electrical energy. Not only was our coal being destroyed, but valuable by-products were being thrown away. About two million tons of coke, 60 thousand tons of sulphate of ammonia, and 60 million gallons of tar could be recovered from this quantity of coal, not mentioning the tremendous volume of gas which could be recovered and converted to useful purposes. He would not, in the slightest degree, attempt to belittle the necessity of an electrical industry in this country, as he knew it to be absolutely essential. There were purposes to which electricity could be better applied than could any other power; the gas industry made use of it for such purposes. The objection to the proposed development was that it was to be carried out at the nation's expense. Surely the electrical industry was capable of its own development, and quite independent of State subsidy.

As shown by the Board of Trade returns, the gas industry carbonised just over 17,300,000 tons of coal last year, or a little more than 10 per cent. of the total coal consumption of Great Britain. In 1924, 237,000 tons less were carbonised than in 1920, and yet the quantity of gas produced was over 17,0 million cu. ft. more than in 1920—an increased production gas from a decreased quantity of coal. Last year the ga industry recovered from the quantity of coal carbonised an placed at the nation's disposal 11,600,000 tons of coke, 124,7 tons of ammonium sulphate, and 195 million gallons of ta Of the total coal consumption of Great Britain, the gas industr could claim to treat its portion more scientifically and, at th same time, more efficiently than any other consumer of coal.

The president believed the future of low-temperature carbon sation would be very bright. It might not be a commercia proposition at the moment, but the future would bring thi to success upon a large scale process. It was a process whic extended very great possibilities; not only did it offer a soli smokeless fuel, but very large quantities of fuel oil. Ou wealth of coal, if scientifically treated, would yield more fue oil than was necessary to meet our requirements. Low temperature carbonisation was a small-scale process at present but would yet become one of the most essential and most im portant industries in this country.

The gas industry could not stand aloof from the low temperature carbonising process, but must assist in the pre liminary work necessary for ultimate success. Low-tempera ture carbonisation opened out a new field of products almost distinct from those derived from the high-temperature pro cess. A market must necessarily be found for the solid pro duct, but was there not a tremendous problem awaiting solution in atmospheric purification? This could only be overcome, and permanently solved, by the enforced use of smokeless fuel for industrial and domestic purposes. In low-temperature carboni sation he foresaw a great industry.

point worthy of great consideration was that of the
geration and supply of electricity by gas undertakings.
Within recent months many gas undertakings had applied for
n. obtained powers to generate and supply electricity. This
w; not altogether unusual, as the number of gas under-
tings which were also supplying electricity had increased
fly rapidly within recent times. Had they to take it that
tl; was to be a new branch of the gas industry? Was it
psible that the present gas industry might yet become the
l·trical industry? Would the two competitive industries
bome one great combine for the supply of light, heat, and
p·er, in the form of gas and electrical current? Was it
psible to imagine such a combination of industries? The
psident believed that it was not impossible.

he generation of electricity by means of the consumption
draw coal without the recovery of residual products was
wsteful, and did not coincide with the present age of science.
It might be argued that the electrical industry could put down
pat for the scientific treatment of coal coinciding with the
geration of electricity. This was to be admitted as being
qte possible—but why duplicate the coal-carbonising plants
of the country? Would it not involve ruthless capital expen-
dare? Must the nation's wealth, in coal and money, be
srificed and squandered simply for the purpose of preserving
o industry's dignity against another?

;t was possible for the gas industry to generate electricity
; one or by a combination of methods, whichever might be
decided upon as being most adaptable to the existing condi-
tis. In many gas undertakings there was a quantity of
splus heat available which could be utilised for steam-raising
prposes, and the steam in turn could be used as power for
gerating sets. Again, it was possible, with carbonising
pnt available, to carbonise coal slack for the production of
c-grade coke and breeze for steam-raising purposes, the
sam being utilised as before for generating sets.

;t might be said that the surplus heat available would be
nable to generate sufficient steam for the desired purpose.
This might be so in certain instances, but it would always be
psible to have gas-driven generators as auxiliary plant, so
t these could be brought into operation when the load was
gater than the output of the steam generating sets.

With the introduction of low-temperature carbonisation and
smokeless fuel plants it was probable that greater possibilities
f the generation of electricity by gas undertakings might
bome obvious. Where the smokeless fuel plant gave a gas
o low calorific value the gas could be utilised for steam-
rsing purposes. In the case of plants giving a high-grade gas
this could be used for driving large gas engines for the pur-
pe of generating electric current.

he coming of the gas turbine was still delayed, but the
psident believed the present difficulties would eventually be
orcome and that the gas turbine would displace less efficient
nchinery now in use. With the coming of the gas turbine
there would open out to the gas industry an entirely new field,
wereby the industries of the country would benefit to a very
gat extent. At present they had no high-speed gas-driven
nchine to compare with the steam turbine, but he hoped that
th future would bring a gas-driven machine as efficient and
enomical as the steam turbine.

t might be asked: "What advantages are to be gained when
g; and electricity are supplied by the same undertaking?"
I believed the advantages to be many, although there were at
th same time disadvantages set up in such cases. Probably
th greatest advantage was that the work of the joint under-
ting would be more economical and more efficient than
to separate undertakings. It would be possible for a gas
ndertaking to generate electricity by a variety of methods,
wereas in the electrical industry, at present, they were bound
dwn almost entirely to one method, and that was admittedly
vy wasteful and inefficient. In a joint undertaking for
th generation and supply of gas and electricity it would be
psible by one, or by a combination of methods, to generate
ad supply electricity more efficiently and more economically.
Nt only would this be so from a national viewpoint, but also
fm that of the consumer.

t had been suggested by a committee over which Mr. Lloyd
Corge presided that it would raise the efficiency of electricity
pduction if the coal was subjected to carbonisation previous
t being used for steam production. Was not that the every-
dy practice of the gas industry? Why should it be necessary
t set up new coal carbonising plants for the production of
ectrical current when plants were already in existence all
or the country? Many electrical undertakings were realising
th value of one of the principal products of the gas industry,
ad utilising it for the production of steam. Large quantities
o coke produced by the gas industry were being consumed
anually by the electrical industry for steam-raising purposes.
Was not this a sign of the times? The president believed it
rarked a further stage in the gas industry.

Apart from the advantages to be derived by the nation from
th combined industry, he believed the consumer would
benefit to a very great extent. In some parts of the country
a present they had competition between the two industries
which certainly amounted to rivalry. This was quite un-
necessary. Was there not a tremendous field and a great
future for both gas and electricity? At present both industries
were advocating their products as being more efficient and
more economical than the other for every purpose, and it was
in such instances that he believed the consumers did not
receive the service which could be provided by a combined
industry. Gas and electricity had each their fields, in which
ce was of greater service to the consumer than the other.
Each had its purposes to which it could be best applied, but at present they were not always being applied to their best purposes. Gas and electricity were not both best for the same purpose, but that was as they had it to-day, with the result that the consumers did not receive the proper service from either industry. A combined industry would give the consumers a service which at present was not obtainable. Gas and electricity would be applied to the uses and purposes of the consumers to which they were best suited. Those in authority in both industries knew the limits to which their products might be best applied in the form of light, heat, and power, but as long as the industries were separate those limits would be over-reached, to the consumers' loss.

In answer to the question: "Do you think gas a thing of the past?" the president said he utterly failed to understand why anyone should ask such a question. The total quantity of gas sold last year (1924) showed an increase of more than 15,000 million cu. ft. over 1923, and almost 21,500 million cu. ft. more than the quantity sold in 1920. Compared with 1923, the quantity of gas consumed for street lighting last year increased by 637 million cu. ft.—greater than the quantity in 1920 by almost 2,700 million cu. ft. Last year 183,000 more people realised and secured the services of gas, and since 1920 the number of gas consumers had increased by more than half a million. The future extended great progress and prosperity to the gas industry—greater progress and prosperity than it had yet experienced.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Is the Contracting Business Degenerating?

The letter from the "Hard-Working Ex-Service Electrical Contractor" comes as a little additional recreation for the "sit-at-home" contractor to ponder over during a few of the leisure moments of which he has such a surplus.

One feels that the arguments or contentions would be better supported if his (the hard-working gentleman's) earnings could not exceed, say, 12s. per day. Why does he not get busy and find men to work for him who may possibly earn, say, 16s. per day! Look at the enormous profit he would make by joining the happy band of "sit-at-homes" in such a case. He would find it all so easy.

Another little point, on this gentleman's own showing, is that his customers (or his portion of the "British public") appear to be paying at least 12s. 6d. for not more than ten shillings' worth of value in his work.

There is, however, a serious side, and we owe this hard-working gentleman some slight thanks for this publicity. It must be perfectly obvious that if this gentleman can earn 25s. per day by doing work at 10s. 6d. per point, any contractor would be able to do such work at such a price (and even pay his men above the standard rate) and still make a substantial amount to cover his overhead expenses and allow for profit. Also, we imagine, the average builder or house owner would (prices being equal) prefer to place his work with a person or firm of some substance and standing, rather than with a purely one-man firm which generally works with such a stock as is easily movable and kept in his own backyard, and does the accounts at night.

Of course, the letter is only alluding to the little cheap house jobs which are about at present. On large contract work the one-man concern would never be entertained for a moment. On the whole, the one-man concern lowers the standard of work and does considerable harm to the electrical trade. Our hard-working friend will, we hope, be an exception, but he will know, as well as most of us, that a lot in his letter is sheer nonsense.

C. J. B. Barlow.

Warrington, *October 21st*, 1925.

Two-way Pendant Switch Flexibles.

Under the pen name of "Safety First," we had occasion some two years ago to refer to ignition caused by electrical stress across the insulation of the cores of two-way flexibles, of which we have experienced no fewer than seven instances, all occurring in periods of exceptional humidity.

Our explanation was coldly received by some manufacturers, and misunderstood or denied by others.

During the past two days the condition of extreme humidity has again given rise to further outbreaks of this dangerous nature. There is still no 2-way ratchet action ceiling switch on the market.

We have reason to believe that such a switch would meet the approval of contractors throughout the world. That, however, would appear to be a matter of little importance to British manufacturers.

Does anyone know of a foreign source of supply for these long overdue necessities?

For **Teesdale & Jones.**

W. I. Jones.

Swindon, *October 22nd*, 1925.

Motor Converters v. Rotary Converters.

It is now becoming a matter of frequent occurrence in specifications that motor converters are being called for in cases where rotary converters would obviously be a far more economical proposition and, to all appearance, entirely satisfy the technical requirements.

Although the fashion of the moment in the matter of equipments seems often to play a rather important part in the preparation of specifications, it is hardly credible that a type of plant should be reverted to, which was admittedly evolved to meet conditions of other days. At the present time such a high degree of efficiency and reliability has been reached with rotary converters that hardly a case remains in practice where these machines cannot be used with advantage in preference to motor converters. At the same time, there is no longer any essential point in which motor converters can be regarded as superior to rotary converters. A review of the principal claims put forward in favour of motor converters will make this perfectly patent; these claims can be summarised as follows:—

1. Possibility of connecting the plant direct to the high-pressure supply without transformer, up to 11,000 volts.
2. Simple starting up and nearly immediate synchronising.
3. High efficiency and possibility of maintaining a power factor always in the neighbourhood of unity.
4. Large range of regulation on the d.c. side.
5. Perfect balancing in the case of three-wire systems.
6. Low peripheral speed.
7. Safe operation without highly-trained staff.

Let us now consider these claims one by one and see wherein they differ from those which can be brought forward for rotary converters, or how far they represent practical advantages over rotary converters.

1. The advantage is here on the side of the rotary converter, as the fact that this plant requires a transformer means that the high-pressure windings are immersed in oil, and consequently more reliable than the best designed high-pressure windings of the motor. Furthermore, the transformer acts as a choking coil in case of resonance or similar troubles. On the other hand, the repairs can be carried out more easily than in a motor, in the event of a breakdown of insulation.
2. There is no difference as compared with a rotary converter, which is quite as simple to start up and synchronise as a motor converter.
3. The efficiency of a rotary converter, including the transformer, is higher than that of a motor converter, as on the one hand the efficiency of the transformer is considerably higher than that of the best three-phase induction motor, and, on the other hand, the efficiency of the rotary converter is higher than that of the generator of a motor converter.

   In the case of a 1,000-kW equipment, for instance, the efficiencies would be as follows:—

Transformer	about 98.6 per cent.
Rotary converter ...	about 95 per cent. at full load
Total efficiency ...	about 94 per cent.

   If we further include 1 per cent. for the series reactances, we arrive at about 93 per cent.

   In the case of a motor converter, the efficiencies would be under the most favourable conditions, as given below:—

Motor	about 95 per cent.
Generator	about 94 per cent.
Total efficiency	about 89.5 per cent.

   With larger sets the gain in efficiency secured through the use of rotary converters is still greater.

   The power factor of rotary converters, on the other hand, is also approximately unity or leading.
4. The range of regulation of motor converters is actually larger in view of the fact that the d.c. machine works partly as a generator. In the case of a set where the number of poles of the three-phase induction motor and of the d.c. machine are the same, so that the latter works half as a generator, the range is about double that of a rotary converter; this seeming disadvantage can, however, easily be compensated for by making use of an induction regulator, by means of which it is possible to deal not only with the regulation on the d.c. side, but also with the large fluctuations liable to occur on the a.c. side. The efficiency of the rotary converter, including the induction regulator, is, even then, higher than that of the motor converter.
5. There is no difference here between a rotary converter and a motor converter, with regard to the balancing of three-wire systems.
